During the prosperous state of the king's affairs, the pleafures of the court were carried on with much tafte and magnificence. Poetry, painting, mufic, and architecture, were all called in to make them rational amusements. Mr Walpole is of opinion, that the celebrated festivals of Louis XIV. were copied from the shows exhibited at Whitehall, in his time the most polite court in Europe. Ben Johnson was the laureat; Înigo Jones the inventor of the decorations; Laniere and Ferabosco composed the fymphonies; the king, the queen, and the young nobility, danced in the interludes. We have accounts of many of those entertainments, called masques; they had been introduced by Anne of Denmark. Lord Burlington had a folio of the defigns for these folemnities, by Inigo's own hand, confifting of habits. malks, fcenes, &c. The harmony of these masks was a little interrupted by a war that broke out between the compofers, Inigo and Ben; in which, whoever was the aggressor, the turbulent temper of Johnson took care to be most in the wrong.

The works of Inigo Jones are not scarce; Surgeon's hall is one of his best works. One of the most admired is the Arcade of Covent-garden, and the Church: "Two structures (fays Mr Walpole), of which I want tafte to fee the beauties. In the arcade there is nothing remarkable; the pilasters are as arrant and homely kripes as any plasterer would make. The barn-roof over the portico of the church strikes my eyes with as little idea of dignity and beauty, as it could do if it covered nothing but a barn. It must be owned, that the defect is not in the architect, but in the order .- Who ever faw a beautiful Tufcan building? Would the Romans have chosen that order for a temple?" The expence of building that church was

4500 1.

ty, Lincoln's-Inn Fields, as it shall be drawn by way general of the works. That fquare is laid out with a dimensions of one of the pyramids: this would have nelworth Castle was erected in the form of an horsefetter, and the Escurial in the shape of St Laurence's

gridiron.

Coleshill in Berkshire, the feat of Sir Matthew Pleydell, built in 1650, and Cobham-hall in Kent, were Jones's. He was employed to rebuild Castle Ashby, and finished one front : but the civil war interrupted his progrefs there and at Stoke-park in Northamptonshire. Shaftsbury-house, now the London Lyingin hospital, on the east fide of Aldersgate-street, is a beautiful front. The Grange, the feat of the lord chancellor Henley in Hampshire, is entirely of this mafter. It is not a large house, but by far one of the 461. a-year for house-rent, besides a clerk, and incideft proofs of his taste. The hall, which opens to a
dental expences. What greater rewards he had, are finall vestibule with a cupola, and the stair-case adjoining, are beautiful models of the purest and most classic antiquity. The gate of Beaufort-garden at Chelfea, defigned by Jones, was purchased by lord Burlington, and transported to Chiswick. He drew a plan for a palace at Newmarket; but not that wretched hovel that stands there at present. One of the most beautiful of his works is the Queen's house at Greenwich. The first idea of the hospital is said to have been taken by his scholar Webb, from his papers.

Inigo tasted early the misfortunes of his master. He was not only a favourite, but a Roman Catholic: in 1646, he paid 545 l. for his delinquency and fequestration. Whether it was before or after this fine, it is uncertain, that he and Stone the mafon buried their joint flock in Scotland-yard; but an order being published to encourage the informers of fuch concealments, and four persons being privy to the spot where the money was hid, it was taken up, and reburied in Lambeth-marsh. Grief, misfortunes, and age, put an end to his life at Somerfet-house, July 21. 1651. Several of his defigns have been published by Mr Kent, Mr Colin Campbell, and Mr Isaac Ware. He left in MS. fome curious notes on Palladio's architecture, which are inferted in an edition of Palladio published in 1714-

10NIA, a country of Asia minor, bounded on the north by Æolia, on the west by the Ægean and Icarian feas, on the fouth by Caria, and on the east by Lydia and part of Caria. It was founded by colonies from Greece and particularly Attica, by the Ionians or fubjects of Ion. Ionia was divided into 12 fmall states which formed a celebrated confederacy often mentioned by the ancients. These 12 states were Priene. Miletus, Colophon, Clazomenæ, Ephefus, Lebedos, Teos, Phocæa, Erythræ, Smyrna, and the capitals of Ool. Sames and Chies. The inhibitants of Ionia built a Ambretbury in Wilthire was defigned by Jones, but temple which they called Pan Ionium from the conexecuted by his feholar Web's Jones was one of courfe of people that flocked there from every part of the first that observed the same diminution of pilasters Ionia. After they had enjoyed for some time their as in pillars. Lindfay-house in Lincoln's Inn Fields, freedom and independence, they were made tributary which he built, owes its chief grace to this fingula- to the power of Lydia by Croefus. The Athenians rity. Qq2

he invaded Greece. They were delivered from the Persian yoke by Alexander, and restored to their original independence. They were reduced by the Romans under the dictator Sylla. Ionia has been always celebrated for the falubrity of the climate, the fruitfulness of the foil, and the genius of its inhabi-

IONIC ORDER. See ARCHITECTURE, nº 45. Ionic Dialett, in grammar, a manner of speaking

peculiar to the people of Ionia.

JONIC Sed was the first of the ancient fects of philosophers: the others were the Italic and Eleatic. The founder of this feet was Thales, who, being a native of Miletus in Ionia, occasioned his followers to affume the appellation of Ionic: Thales was succeeded by Anaximander, and he by Anaximenes, both of Miletus: Anaxagoras Clazomenius fucceeded them, and removed his school from Asia to Athens, where Socrates was his scholar. It was the distinguishing tenet of this fect, that water was the principle of all natural

IONIUM MARE, a part of the Mediterranean Sea, at the bottom of the Adriatic. It lies between Sicily and Greece. That part of the Ægean sea which lies on the coasts of Ionia in Asia, is called the Sea of Ionia, and not the Ionian Sea. According to some authors, the Ionian fea receives its name from Io, who fwam across there after she had been metamorphosed

into a heifer.

JONK, or JONQUE, in naval affairs, is a kind of fmall ship, very common in the East Indies. These vessels are about the bigness of our fly-boats; and differ in the form of their building, according to the different methods of naval architecture used by the nations to which they belong. Their fails are frequently made of mats, and their anchors are made of wood.

JONSTON (John), a learned Polish naturalist and physician, born in 1603. He travelled all over Europe, and procured efteem every where by his knowledge; afterward he bought the estate of Ziebendorf in the duchy of Lignitz in Silefia, where he fpent the remainder of his days. He wrote a natural history of birds, fish, quadrupeds, infects, ferpents, and dragons, in folio; a piece upon the Hebrew and Greek festi-

JOPPA, a fea-port town in Palestine, lying fouth of Cæfarea; and anciently the only port to Jerusalem, whence all the materials fent from Tyre towards the building of Solomon's temple were brought hither and landed, (2 Chr. ii. 16.) It is faid to have been built by Japhet, and from him to have taken its name Japho, afterwards moulded into Joppa; and the very heathen geographers speak of it as built before the flood. It is now called Jaffa, somewhat nearer to its

JOR, the Hebrew for a river, which, joined with Dan, concurs to form the term Jordan. See Dan.

was born at Naples in 1632. He became very early a disciple of Joseph Ribera; but going afterwards to Rome, he attached himself to the manner of Pietro da

tion to their mother-country, and joined Xerxes when Spain, he engaged him in painting the Escurial; in Jordans which task he acquitted himself as a great painter. The king showed him a picture of Bassani, expressing Tofephus. his concern that he had not a companion: Luca painted one fo exactly in Bassani's manner, that it was taken for a performance of that mafter; and for this fervice he was knighted, and gratified with feveral honourable and valuable employments. The great works he executed in Spain, gave him fill greater reputation when he returned to Naples; fo that though he was a very quick workman, he could not supply the eager demands of the citizens. No one, not even Tintoret, ever painted fo much as Jordano: and his generofity carried him fo far as to prefent altar-pieces to churches that were not able to purchase them. His labours were rewarded with great riches; which he left to his family, when he died, in 1705.

IORDANS (James), one of the most eminent painters of the Flemish school, was born at Antwerp in 1503. He learned the principles of his art from Adam Van Ort, whose daughter he married; which connection hindered him from gratifying his inclination. of vifiting Italy. He improved most under Rubens; for whom he worked, and from whom he drew his best principles: his tafte directed him to large pieces; and his manner was strong, true, and sweet. A great number of altar pieces painted by him are preferved in the churches in the Netherlands, which maintain the reputation of this artift. He died in 1678.

JORTIN (John), a very learned and ingenious English clergyman, was born in Huntingdonshire, about the year 1701. Having some private fortune of his own, and being of a peculiar disposition that could not folicit promotion, he remained long without preferment. In 1738, lord Winchester gave him the living of Eastwell in Kent; but the place not agreeing with his health, he foon refigned it. Archbishop Herring, who had a great value for him, about the year 1751 presented him to the living of St Dunstan's in the East; and bishop Osbaldiston in 1762 gave him that of Kenfington, with a prebend in St Paul's cathedral, and made him archdeacon of London. His temper, as well as his aspect, was rather morose and faturnine; but in company that he liked, he was at all times facetious, yet still with a mixture of sal censura vals, a thaumatography, and fome poems. He died fuperiorum. His fermons were fensible and argumentative; and would have made more impression on his hearers, had he been more attentive to the advantages flowing from a good delivery : but he appeared to greater advantage as a writer. His remarks on ecclefiaftical history, his fix differtations, his life of Erafmus, and his fermons, were extremely well received by the public, and have undergone feveral editions. He died in the year 1770.

JOSEPH, the fon of Jacob; memorable for his chaffity, and the honours conferred on him at the first appellation, and is but in a poor and mean condition. court of Egypt, &c. He died in 1635 B. C. aged

JOSEPHUS, the celebrated historian of the Jews, JORDANO (Luca), an eminent Italian painter, was of noble birth, by his father Mattathias descended from the high-priefts, and by his mother of the bloodroyal of the Maccabees; he was born A. D. 37, under Caligula, and lived under Domitian. At 16 years of Cortona, whom he affifted in his great works. Some age he betook himself to the fect of the Effenes, and of his pictures being feen by Charles II. king of then to the Pharifees; and having been successful in a

journey to Rome, upon his return to Judæa he was made captain general of the Galilæans. Being taken prisoner by Vespasian, he foretold his coming to the empire, and his own deliverance by his means. He accompanied Titus at the fiege of Jerusalem, and wrote his "Wars of the Jews," which Titus ordered to be put in the public library. He afterwards lived at Rome, where he enjoyed the privileges of a Roman citizen, and where the emperors loaded him with favours, and granted him large pensions. Besides the above work, he wrote, 1. Twenty books of Jewish antiquities, which he finished under Domitian. 2. Two books against Appian. 3. An elegant discourse on the martyrdom of the Maccabees. 4. His own life. These works are excellently written in Greek.

IOSHUA, the renowned general of the Tews, who conducted them through the wilderness, &c. died in

1424 B. C. aged 110.

JOSHUA, a canonical book of the Old Testament, containing a history of the wars and transactions of the person whose name it bears. This book may be divided into three parts: the first of which is a history of the conquest of the land of Canaan; the second, which begins at the 12th chapter, is a description of that country, and the division of it among the tribes; and the third, comprifed in the two last chapters, contains the renewal of the covenant he caused the Israelites to make, and the death of their victorious leader and governor. The whole comprehends a term of 17, or, according to others, of 27 years.

JOSIAH, king of Judah; the destroyer of idolatry, and the restorer of the true worship, an excellent magistrate, and a valiant general, was slain in battle,

609 B. C.

IOTAPATA (anc. geog.), a town of the Lower Galilee, distant 40 stadia from Gabara; a very strong place, fituated on a rock, walled round, and encompaffed on all hands with mountains, fo as not to be feen but by those who came very near. It was with great difficulty taken by Vespasian, being defended by Josephus, who commanded in it; when taken, it

was ordered to be razed.

[OUBERT (Lawrence), counfellor and physician to the king of France, chancellor and judge of the university of Montpelier, was bor at Valance in Dauphiny in 1530. He became the disciple of Rondelet at Montpelier; and at his death fucceeded to the regins professorship of that university, where he had given abundant proofs of his merit, and strengthened his reputation by the lectures he read in that capacity, as well as by the works he published. Henry III. who passionately wished to have children, sent for him to Paris, in hopes by his affiftance to render his marriage fruitful; but he was disappointed, without any loss of repute to Joubert. Much offence was indeed taken at a piece he published under the title of Vulgar errors, in which he treated of virginity and generation more plainly than had ever before been done in the French language. But, though he had promifed fomething more on the same subject, he was so piqued at the clamour raifed against it, that the public faw no more, of fix parts promifed, than the first, and part of the fecond, though they were greatly called for. He died in 1582; and his fon Ifaac trauflated fome of his Latin paradoxes into French.

IOVIAN, the Roman emperor, elected by the Jovian army, after the death of Julian the apostate, in 363. He at first refused, faying he would not command idolatrous foldiers; but, upon an affurance that they would embrace Christianity, he accepted the throne, and immediately that all the Pagan temples, and forbid their facrifices. But he did not long enjoy the dignity to which his merit had raifed him ; being fuffocated in his bed by the fumes of a fire that had been made to dry the chamber, in 364, the 33d of his age, and the eighth month of his reign. See Con-STANTINOPLE, nº 67.

JOVIUS (Paul), in Italian Giovio, a celebrated historian, was born at Como in Italy, in the year 1483. As his father died in his infancy, he was educated by his eldest brother Benedict Jovius, under whom he became well skilled in classical learning; and then went to Rome, for the fake of enjoying the benefit of the Vatican library. He there wrote his first piece, De piscibus Romanis, which he dedicated to cardinal Lewis of Bourbon. He received a pension of 500 crowns for many years from Francis I. king of France, whose favour he secured by his flatteries. But, in the following reign, having difgusted the constable Montmorency, his name was fruck out of the lift of penfioners. Jovius did not fuffer his spirits to fink under his miffortune: he had obtained a high reputation in the learned world by his writings; and having always showed great respect to the house of Medicis, on whose praifes he had expatiated in his works, he applied to Clement VII. and obtained the bishoprick of Nocera, His principal piece is his history, which is that of his own time throughout the world, beginning with 1404, and extending to the year 1544. This was the chief butiness of his life. For he formed the plan of it in the year 1515; and continued upon it till his death, which happened at Florence in 1552. It is printed inthree volumes folio. He is allowed to have been a man

and polished flyle, and has many curious observations : but being a venal writer, his histories are not much JOURNAL, a day-book, register, or account of

of wit as well as learning: he was mafter of a bright

what paffes daily. See DIARY.

JOURNAL, in Merchants Accounts, is a book into which every particular article is posted out of the waste-book, and made debtor. This is to be very clearly worded, and fairly engroffed. See Rook-

JOURNAL, in navigation, a fort of diary, or daily register of the ship's course, winds, and weather; together with a general account of whatever is material to be remarked in the period of a fea-voyage.

In all fea-journals, the day, or what is called the 24 hours, terminates at noon, because the errors of the dead-reckoning are at that period generally corrected by a folar observation. The daily compact usually contains the state of the weather; the variation, increase, or diminution of the wind; and the fuitable shifting, reducing, or enlarging the quantity of fail extended; as also the most material incidents of the voyage, and the condition of the ship and her crew ; together with the discovery of other ships or fleets, land, shoals, breakers, foundings, &c.

TOURNAL, is also a name common for weekly effays.

Tournal Ipecacuanha.

newspapers, &c. as the Gray's-Inn journal, the West- in. minster journal, &c.

JOURNAL, is also used for the titles of several books which come out at flated times, and give abstracts, accounts, &c. of the new books that are published, and the new improvements daily made in arts and sciences; as the Journal de Scavans, Journal de Physique, &c.

IOURNEY, a tract of ground passed over in travelling by land; properly as much as may be paffed

over in one day.

Management of a Horse on a Yourney. See Horse. IOURNEYMAN, properly one who works by the day only; but the word is now used for any one who works under a malter, either by the day, the year, or

the piece.

JOUVENET (John), a celebrated French painter, was born at Rouen in 1644; where his father, who was a painter, bred him up to the fame profession: but his greatest improvement was confessedly derived from the instructions of Nicholas Poussin, and studying the works of that mafter. He acquired fo good a knowledge of defign, as qualified him for employment in feveral grand works in the palaces at Paris and Trianon: in many of the churches and convents; and in the hospital of invalids, where he painted the twelve apostles, each figure being 14 feet high. He was efleemed to have a ready invention, to be correct in his defigns, and to have a taste for grandeur in his compositions: it is observed of this artist, that being deprived of the use of his right hand by a paralytic diforder, he nevertheless continued to paint with his left. He died in the year 1717.

JOY, in ethics, is that passion which is produced by love, regarding its object as prefent, either immediately or in prospect, in reality or imagination. This passion has been found to increase the PERSPIRA-

TION and urine of human bodies. TOYNERY. See Joinery.

IPECACUANHA, in the materia medica, a West-Indian root, of which there are principally two kinds, diffinguished by their colour, and brought from different places; but both possessing the same virtues, tho' in a different degree. The one is ash-coloured or grey, and brought from Peru; the other is brown, and is brought from the Brafils: and these are indifferently fent into Europe under the general name of ipe-

These two forts have been by some supposed to be the roots of two different plants: but, according to others, this is a mistake; the only difference being that one grows in a different place, and in a richer and moifter foil, and is better supplied with juices than the other. The plant they belong to is a species of Psy-

CHOTRIA.

The ash-coloured ipecacuan is a small wrinkled root, bent and contorted into a great variety of figures, brought over in short pieces full of wrinkles, and deep circular fisfures, quite down to a fmall white woody fibre that runs in the middle of each piece: the cortical part is compact, brittle, looks smooth and resinous upon breaking: it has very little fmell; the tafte is bitterish and subacrid, covering the tongue as it were with a kind of mucilage. The brown fort is small,

The first fort, the ash-coloured or grey ine- specacocacuan, is that usually preferred for medicinal use. The brown has been fometimes observed, even in a fmall dose, to produce violent effects. A third fort. called the white from its colour, has also been diffinguished. It is woody, has no wrinkles, and no perceptible bitterness in taste. This, though taken in a large dose, has scarce any effect at all. It is supposed to belong to a species of VIOLA. Mr Geoffroy calls this fort baftard ipecacuan, and complains that it is an imposition upon the public. Geoffroy, Neumann, Dale, and Sir Hans Sloane, inform us, that the roots of a kind of apocynum (dogs-bane) are too frequently brought over instead of it; and instances are given of ill confequences following from the use of it. But if the marks above laid down, particularly the ash colour, brittleness, deep wrinkles, and bitterish taste, be carefully attended to, all mistakes of this kind may be prevented.

Ipecacuan was first brought into Europe about the middle of last century, and an account of it published about the same time by Pifo; but it did not come into general use till about the year 1686, when Helvetius, under the patronage of Louis XIV. introduced it into practice. This root is one of the mildest and fafest emetics with which we are acquainted; and has this peculiar advantage, that if it should not operate by vomit, it passes off by the other emunctories. It was first introduced among us with the character of an almost infallible remedy in dysenteries, and other inveterate fluxes, as menorrhagia and leucorrhæa, and also in disorders proceeding from obstructions of long standing: nor has it lost much of its reputation by time. In dyfenteries, it almost always produces happy effects, and often performs a cure in a very fhort space of time. In other fluxes of the belly, in beginning dyfenteries, and fuch as are of a malignant kind, or where the patient breathes a tainted air, it has not been found equally successful: in these cases it is necessary to continue the use of this medicine for feveral days, and to join with it opiates, diaphoretics, and the like. This root, given in substance, is as effectual, if not more fo, than any of the preparations of it: the pure refin acts as a strong irritating emetic. but is of little fervice in dysenteries; while an extract prepared with water is almost of equal fervice in thefe cases with the root itself, though it has little effect as an emetic. Geoffroy concludes from hence, that the chief virtue of ipecacuan in dyfenteries depends upon its gummy fubstance, which lining the intestines with a foft mucilage, when their own mucus has been abraded, occasions their exulcerations to heal, and defends them from the acrimony of the juices : and that the refinous part, in which the emetic quality refides, is required, where the morbific matter is lodged in the glands of the stomach and intestines. But if the virtues of thisroot were entirely owing to its mucilaginous or gummy part, pure gums, or mucilages, might be employed to equal advantage. Water, affifted by a boiling heat, takes up from all vegetables a confiderable portion of refinous along with the gummy matter : if the ipecacuan remaining after the action of water be digested with pure spirit, it will not yield half so much refin as and fomewhat more wrinkled than the foregoing; of a at first: fo that the aqueous extract differs from the brown or blackish colour without, and white with- crude root only in degree, being proportionably less *pecacu- refinous, and having less effect, both as an emetic, and in the cure of dysenteries. The virtues of ipecacuan, in this disorder, depend upon its promoting perspiration, the freedom of which is here of the utmost importance. and an increase of which, even in healthful persons, is generally observed to suppress the evacuation by stool. In dysenteries, the skin is for the most part dry and tense, and perspiration obstructed: the common diaphoretics pass off without effect through the intestinal canal: but ipecacuan, if the patient after a puke or two be covered up warm, brings on a plentiful fweat. After the removal of the dysentery, it is necessary to continue the use of the medicine for some time longer, in order to prevent a relapfe; for this purpose, a few orains divided into feveral dofes, fo as not to occasion any fenfible evacuation, may be exhibited every day; by this means the cure is effectually established. And indeed small doses given, even from the beginning, have been often found to have better effects in the cure of this difease than larger ones. Geoffroy informs us from his own experience, that he has observed ten grains of the powder to act as effectually as a fcruple or two; and therefore confines the dose betwixt fix and ten grains: it has lately been found, that even fmaller doses prove fufficiently emetic. The only officinal preparation of this root is a tincture made in wine, which accordingly has now the appellation of vinum ipecacuanhe, both in the London and Edinburgh pharmacopœias.

Many ingenious experiments have been made on the fubject of ipecacuan by Dr Irving, for which he obtained the prize medal of the Harveian Society at Edinburgh for 1784. He has afcertained, that while this root contains a gummy refinous matter, yet that the gummy exists in a much greater proportion than the refinous part; that the gummy part is much more powerfully emetic than the refinous; that although the cortical part of the root be more active than the ligneous, yet that even the pure ligneous part poffesses a confiderable emetic power; and that the whole of the root poffeffes confiderable influence, both as an antifentic and astringent. To determine whether the emetic power of ipecacuan was of a volatile or fixed nature, Dr Irving subjected it to distillation. The water obtained by distillation was found to have very little influence; but the decoction which remained in the still, not only operated violently as an emetic, but produced rigours, cold fweats, and other alarming fymptoms. By long continued boiling, the activity of the root itfelf is almost totally destroyed; but Dr Irving found, that the emetic property of ipecacuan was most effectually counteracted by means of the acetous acid, infomuch that thirty grains of the powder taken in two ounces of vinegar produced only fome loofe stools.

Ipecacuan, particularly in the state of powder, is now advantageoufly employed in almost every difease in which full vomiting is indicated; and when combined with opium under the form of the pulvis sudorificus, it furnishes us with the most useful and active sweating medicine which we poffefs. It is also often given with advantage in very fmall doses, so as neither to operate by vomiting, purging, nor fweating.

The full dose of the powder is a scruple or half a dram, and double that in form of watery infusion. The full dofe is recommended in the paroxysm of

fpasmodic asthma, and a dose of three or four grains Iphigenia every morning in habitual althmatic indisposition. A dofe of t or t grain rubbed with fugar, and given every four hours or oftener, is recommended in uterine hemorrhagy, cough, pleurify, hemoptoë, &c. and has often been found highly ferviceable.

IPHIGENIA, a daughter of Agamemnon and Clytemnestra. When the Greeks going to the Trojan war were detained by contrary winds at Aulis, they were informed by one of the foothfayers, that to appeale the gods they must facrifice Iphigenia Agamemnon's daughter to Diana. The father, who had provoked the goddess by killing her favourite stag, heard this with the greatest horror and indignation; and rather than to fled the blood of his daughter, he commanded one of his heralds, as chief of the Grecian forces, to order all the affembly to depart each to his respective home. Ulyffes and the other generals interfered, and Agamemnon confented to immolate his daughter for the common cause of Greece. As Iphigenia was tenderly loved by her mother, the Greeks fent for her on pretence of giving her in marriage to Achilles. Clytemnestra gladly permitted her departure, and Iphigenia came to Aulis. Here the faw the bloody preparations for the facrifice. She implored the forgiveness and protection of her father; but tears and entreaties were unavailing. Calchas took the knife in his hand : and as he was going to strike the fatal blow, Iphigenia fuddenly disappeared, and a god of uncommon fize and beauty was found in her place for the facrifice. This fupernatural change animated the Greeks, the wind fuddenly became favourable, and the combined fleet fet. fail from Aulis.

IPICRATES, general of the Athenians, had that command conferred upon him at 20 years of age. and became famous for the exactness of his military discipline. He made war on the Thracians ; restored Senthes, who was an ally of the Athenians; attacked the Lacedæmonians; and, on many other occafions, gave figual proofs of his conduct and courage. Many ingenious repartees have been mentioned of this. general: a man of good family with no other merit than his nobility, reproaching him one day for the meanness of his birth, he replied, " I shall be the first of my race, and thou the last of thine." He died 380 B. C

IPOMEA, QUAMOILIT, or Scarlet Convolvulus : A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 29th order, Campanacea. The corolla. is funnel-shaped; the stigma round-headed; the capfule triloculor. There are feveral species; but not more than one, (the coccinea), cultivated in our gardens. This hath long, flender, twining stalks, rifing upon support fix or feven feet high. The leaves are heart-shaped, pointed, and angulated at the base. and from the fides of the stalks and branches arife many flender footstalks; each supporting several large and beautiful funnel-shaped and scarlet flowers. There is a variety with orange coloured flowers. Both of them are annual, rifing from feed in fpring, flowering in July and August, ripening their seeds in September and October, and totally perishing in a flort time after. They are tender, and must be brought up in a hot-bed till the latter end of May or beginning of

fionally to adorn any particular place; but in either Grafton; and fends two members to parliament. cafe, there must be sticks for them to twine upon.

England, feated in E. Long. 1. 6. N. Lat. 52. 12. The name comes from the Saxon Gypefwick, that is, a town fituated upon the Gyppen, now called Orwell. It had once 21 churches, but now has only 12. It was plundered by the Danes in 991, and afterwards be-fieged by king Stephen. It had charters and a mint in the reign of king John, but its last charter was from Charles II. The remains of a wall and fix or feven religious houses are still to be feen. Though it is not able, irascible, and concupiscible parts. The two last, in so flourishing a state as formerly when the harbour according to that philosopher, are the corporeal and was more commodious, yet it is still a large well-built mortal parts of the foul, which give rise to our pastown. Besides the churches already mentioned, it has feveral meeting-houses, two chapels, a town-hall, council-chamber, a large market-place with a cross in the middle of it, a shire-hall for the county fessions, a library, several hospitals, a free school, a handsome ftone-bridge over the river, ftately shambles in the market place built by cardinal Wolfey, who was a native of the town and a butcher's fon, and who also began to build a college here on the ruins of a fmall college of black canons, which still bears his name, though it was never finished. Here are also several alms-houses, three charity-schools, and a convenient key and custom-house. By virtue of Charles II.'s charter, the town is governed by two bailiffs, a recorder, 12 portmen, of whom the bailiffs are two, a townclerk, two coroners, and 24 common-council. The bailiffs and 4 of the portmen are justices of the peace. The town enjoys a great many privileges, as passing fines and recoveries, trying criminal, and even crown and capital causes among themselves, settling the as fize of bread, wine, and beer. No freeman is obliged to ferve on juries out of the town, or bear any office for the king, except that of the sheriff, or to pay tolls or duties in any other part of the kingdom. They have an admiralty jurisdiction beyond Harwich on the Effex coaft, and on both fides the Suffolk coaft, by which they are intitled to all goods cast on shore. The bailiffs even hold an admiralty-court beyond Landguard-fort. Of the eleven kinds of passions attributed to the foul, philosophers ascribe five to the irascible appetite; viz. wrath, boldness, fear, hope, and despair: the other fix are charged on the concupifcible appetite, viz.

pleasure, pain, defire, aversion, love, and hatred. Plato divided the foul into three parts; the reason-

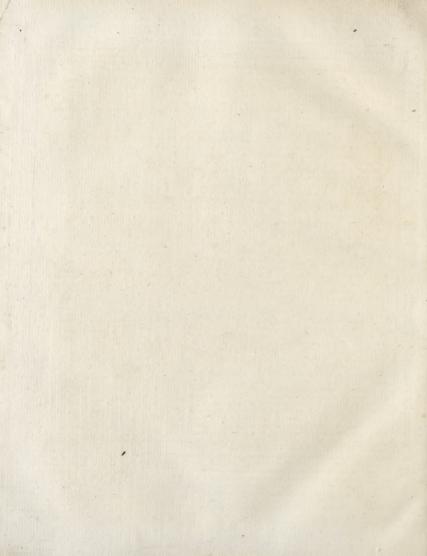

Plato fixes the feat of the irafcible appetite in the heart; and of the concupifcible in the liver; as the two fources of blood and spirits, which alone affect the mind.

IRELAND, one of the Britannic islands, fituated between the 5th and 10th degrees of well longitude. and between the sift and 56th of north latitude. extending in length about 300 miles, and about 150 in breadth.

The ancient history of this island is involved in fo much obscurity, that it has been the object of contention among the antiquarians for upwards of a century and an half. The Irish historians pretend to very great antiquity. According to them, the island was Origin of first inhabited about 322 years after the flood. At the Irish that time Partholanus the son of Scara landed in Mun-ther own fter on the 14th of May with 1000 foldiers, and fome historians. women, from Greece. This voyage he had undertaken on account of his having killed his father and mo-ther in his native country. The same historians inform us, that a great number of lakes broke out in Ireland during the reign of Partholanus, which had no existence when he came into the island, with many other particulars not worth mentioning; but the most furprifing circumstance is, that about 300 years after the arrival of this Grecian colony, all of them perished by a plague, not a fingle person remaining to tell the fate of the reft; in which case, it is wonderful how

After the extinction of this first colony, Ireland rether colony arrived from the east, under the direction of one Nemedius. He fet fail from the Euxine fea rope,

treland. rope, and the third landed in the north of Scotland, and from him the island of Britain is said to have ta-

ken its name, and the Welsh their origin.

About 216 years after the death of Nemedius, the descendants of Simon Breac returned from Greece into Ireland. They were conducted by five princes of great reputation, who divided the island into five kingdoms, nearly equal in fize. These kingdoms were called Munfter, Deinster, Connaught, Meath, and Ulfter; and the subjects of these kings are called by the Irish his-

The Firbolgs were in process of time expelled or totally fubdued, after the lofs of 100,000 men in one battle, by the Tuuth de Dannans, a nation of necromancers who came from Attica, Boeotia, and Achaia, into Denmark; from Denmark to Scotland; and from Scotland to Ireland. These necromancers were fo completely skilled in their art, that they could even restore the dead to life, and bring again into the field those warriors who had been flain the day before. They had also some curiofities which possessed a wonderful virtue. These were a sword, a spear, a cauldron, and a marble chair; on which last were crowned first the kings of Ireland, and afterwards those of Scotland. But neither the powerful virtues of thefe Danish curiofities, nor the more powerful spells of the magic art, were able to preferve the Tuath de Dannans from being subdued by the Gadelians when they invaded Ireland.

The Gadelians were descended from one Gathelns, from whom they derived their name. He was a man of great confequence in Egypt, and intimately acquainted with Moses the Jewish legislator. His mother was Scota, the daughter of Pharaoh, by Niul the fon of a Scythian monarch cotemporary with Nimrod. The Gadelians, called also Scots, from Scota abovementioned, conquered Ireland about 1300 B. C. under Heber and Heremon, two fons of Milefius king of Spain, from whom were descended all the kings of Ireland down to the English conquest, and who are therefore flyled by the Irish historians princes of the

Milefian race.

From this period the Irish historians trace a gradual refinement of their countrymen from a flate of the groffest barbarity, until a monarch, named Ollam Fodla, established a regular form of government, erected a grand feminary of learning, and inflituted the Fes, or triennial convention of provincial kings, priefts, and poets, at Feamor or Tarali in Meath, for the establishment of laws and regulation of government. But whatever were the inflitutions of this monarch, it is acknowledged that they proved infufficient to withfland the wildness and disorder of the times. To Kimbath, one of his fucceffors, the annalifts give the honour of reviving them, besides that of regulating Ulfter, his family province, and adorning it with a stately palace at Eamannia near Armagh. His immediate fuceeffor, called Hugony, is still more celebrated for advancing the work of reformation. It feems, that, from the earliest origin of the Irish nation, the island had been divided into the five provincial kingdoms above. mentioned, and four of these had been subject to the namely, the island of Britain, from whence it is now fifth, who was nominal monarch of the whole island, thought that Ireland was first peopled. A dispute hath These four, however, proved such obstinate disturbers arisen concerning the place from whence the first emiof the peace, that Hugony, to break their power, grants from Britain fet fail for Ireland. The honour Vol. IX. Part. I.

parcelled out the country into 25 dynasties, binding Ireland, them by oath to accept no other monarch but one of his own family. This precaution proved ineffectual. Hugony himself died a violent death, and all his successors for a series of ages were assassinated, scarcely with one exception.

About 100 B. C. the pentarchal government was restored, and is faid to have been succeeded by a confiderable revolution in politics. The Irifh hards had for many ages dispensed the laws, and the whole nation submitted to their decisions; but as their laws were exceedingly obscure, and could be interpreted only by themselves, they took occasion from thence to oppress the people, until at last they were in danger of being totally exterminated by a general infurrection. In this emergency they fled to Convocar-Mac Neffa, the reigning monarch, who promifed them his protection in case they reformed; but at the same time, in

order to quiet the just complaints of his people, he employed the most eminent among them to compile an intelligible, equitable, and diftinct, body of laws. which were received with the greatest joy, and dignified with the name of celeftial decisions. These decifions frem to have produced but very little reformation among the people in general. We are now presented with a new feries of barbarities, murders, factions, and anarchy; and in this difordered fituation of affaits it was, according to the Irish historians, that the chieftain mentioned by Tacitus addressed himself to Agricola, and encouraged him to make a defcent on Ireland. This scheme happened not to suit the views of the Roman general at that time, and therefore was not adopted; and so confident are these historians of the strength of their country even in its then distracted flate, that they treat the notion of its being fubdued by a Roman legion and forme auxiliaries (the force proposed to Agricola), as utterly extravagant : acquainting us at the same time, that the Irish were so far from dreading a Roman invasion, that they failed to the assistance of the Picts, and having made a fuccessful incursion into South Britain, returned home

with a confiderable booty.

In the fame state of barbarity and confusion the kingdom of Ireland continued till the introduction of Christianity by St Patrick, about the middle of the fifth century. This missionary, according to the adverfaries of the Irish antiquity, first introduced letters into Ireland, and thus laid the foundations of a future civilization. On the other hand, the advocates for that antiquity maintain, that the Irish had the knowledge of letters, and had made confiderable progress in the arts, before the time of St Patrick; though they allow, that he introduced the Roman character, in which his copies of the Scripture and liturgies were written. To enter into the dispute would be contrary to our plan. It is sufficient to observe, that, excepting by fome of the Irish themselves, the history already given is generally reckoned entirely fabulous, and thought to have been invented after the introduction of Christianity. An origin of the Irish nation hath been found out much nearer than Afia, Greece, or Egypt; of

aker.

Ireland, of being the mother-country of the Irish hath been Caucii spread from the Lifty to the Letrim, the Ohoca Ireland, diffruted between the North and South Britons. Mr Machberson has argued strenuously for the former, and Mr Whitaker for the latter. For an account of their dispute, however, we must refer to the works of these gentlemen. Mr Whitaker claims the victo-IV, and challenges to himfelf the honour of being the first who clearly and truly demonstrated the origin of the Irish.

The name of Ireland, according to Mr Whitaker, is obviously derived from the word Jur or Eir, which in the Celtic language signsfes "west." This word was fometimes pronounced Iver, and Hiver; whence the names of Iris, Ierna, Juverna, Iverna, Hibernia, and Ireland: by all of which it hath at some time or other

About 350 B. C. according to the same author, the Belgæ croffed the channel, invaded Britain, and feized the whole extended line of the fouthern coaft, from Kent to Devonshire. Numbers of the former inhabitants, who had gradually retired before the enemy, were obliged at last to take shipping on the western coast of England, and passed over into the mainhabited isle of Ireland. These were afterwards joined by another body of Britons driven out by the Belgæ under Divitizeus, about 100 B. C. For two centuries and a half afterwards, thefe colonies were continually reinforced with fresh swarms from Britain; as the populoufness of this island, and the vicinity of that invited them to fettle in the one, or the bloody and fucceffive wars in Britain during this period naturally induced them to relinquish the other: and the whole circuit of Ireland appears to have been completely peopled about 150 years after Christ: and as the inhabi-

general and very apposite name, viz. that of Scuites, or Scots, " the wanderers, or refugees." Mr Whitaker also informs us, "that in the times of the Romans Ireland was inhabited by 18 tribes; by one upon the northern and three on the fouthern shore. by which it feven upon the western, fix on the eastern, and one in

tants had all fled equally from the dominion of the Belgæ, or for fome other caufe left their native coun-

try, they were diffing uished among the Britons by one

the centre.

" Along the eastern coast, and the Vergivian or internal ocean, were ranged the Damnii, the Voluntii, and the Eblani, the Caucii, the Menapii, and the Coriondii. The first inhabited a part of the two counties of Antrim and Down, extending from Fair-head, the most porth-eafterly extremity of the island, to Islamnum Promontorium, or the point of Ardglass haven in the county of Down; and having the Logia or Lagan, which falls into Carrickfergus bay, within their poffessions and Dunum or Down-patrick for their capital. The Voluntii poffeffed the coast from the point of that haven to the river Buvinda or Boyne, the remainder of Down, the breadth of Ardmagh, and all Louth; having the Vinderus or Carlingford river in their dominions, and the town of Laberus near the river Deva (Atherdee in the county of Louth) for their metropolis. And the Eblani reached from the Boyne to the Læbius, Læv-ui, or Liffy; refiding in Eaft-Meath, and in the large portion of Dublin county which is to the north of this river; and acknowledging Mediolanum, Eblana, or Dublin, for their principal town. The

of the ancients; had the rest of Dublin county, and fuch parts of Wicklow as lie in the north of the latter; and owned Dunum or Rath-Downe for their chief city. The Menapii occupied the coast betwist the Letrim and Cancarne point, all the rest of Wicklow. and all Wexford to the point; their chief town. Menapia, being placed upon and to the east of Modona, Slanus, or Slane. And the Coriondii inhabited at the back of the Cancii and Menapii, to the west of the Slane and Liffy, and in all Kildare and all Catherlogh; being limited by the Boyne and Barrow on the west. the Eblani on the north, and the Brigantes on the

" Upon the fouthern shore and along the verge of the Cantabrian ocean, lay the Brigantes, the Vodiæ, and the Ibernii. The first owned the rest of Wexford and all Waterford: extending to the Blackwater, Aven-More, or Dabrona, on the fouth-west; having the great mouth of the Barrow with their territories, and Brigantia. Waterford, or some town near it, for their first city; and giving name of Brigas to the Suir or Swire, their limitary stream on the north, and the appellation of Bergie to their own part of the county of Wexford. The Vodiæ poffeffed the fhire of Corke from the Blackwater to the Ban, the river of Kinfale, and the Dobona or Dubana of the ancients; and affixed the name of Vodium Promontorium to the point of Balycotton island. And the Ibernii inhabited the remainder of Corke, and all that part of Kerry which lies to the fouth east of Dingle-found; having Rufina or Ibanne for their capital, the Promontorium Austriaum or Miffen-Head about the middle of their dominions, and the river Ibernus or Dingle found for their northern barrier; and leaving their names to the three divisions

of Ibaune, Beare, and Iveragh. "Upon the wettern thore of the island and along the Great Britannic or Atlantic ocean, were the Lucanii or Luccnii, the Velaborii, and the Cangani, the Auterii, the Nagnatæ, the Hardinii, and Venicnii. 'The Lucenii inhabited the peninfula of land that lies along the river Ibernus or Dingle found, and perhaps fome adjoining parts of Kerry. The Velaborii ranged along the finall remainder of the latter, and over the whole of Limerick to the Senus or Shannon; having the Darius or Casheen slowing through their dominions, and Regia, Limeric or fome town near it, for their metropolis. And the latter was probably that city near Limerick, the fite of which is still famous, and retains the appellation of Cathair, or the fortrefs; and where the remains of streets, and other marks of a town, may yet be traced. The Cangani lived in the county of Clare: Macolicum near the Shannon, perhaps Feakle or Melic, being their principal town; a headland in the bay of Galway, near Glaniny, being denominated Benifamnum Promontorium; and the adjoining ifles of Arran called Infula Cangana. The Auterii were fettled in the county of Galway; winding along the deeprecefs of the Sinus Aufoba or bay of Galway; ftretching towards the north as far as the Libnius, or the river that bounds the shire in that part; and possessing the fmall portion of Mayo which lies to the South of it. And these were subject to Auterium, anciently Aterith, and now Athenree; and have left their name to the division of Athenree. The Nagnatæ occupied the rest

fination of the tribes was inhabited.

Ireland. of the large county of Mayo, all Sligo and all Rof- flics; but that the evils of the political confliction Ireland. Erne; being bounded by the Rhebius or river of Balyshannon, and the Lake Rhebins or Logh Erne; having a deep bay, called Magnus Sinus, that curves along Mayo, Sligo, and Letrim counties; and acknowledging Nagnat, Necmaht, or Alnecmaht, the town of the Nagnatæ, for their capital. And the Hardinii and Venicnii were confederated together under the title of the Venicnian Nations, extended from Balvshannon to the North-Cape, and poffeifed all Donnegalle, except the two whole divisions of Raphoe and Enis-Owen, and the eaftern part of Killmacrenen. The Venicnii lay along the immediate margin of the shore, giving name to the Promontorium Venicnium or Cape Horn, and to the Infula Venicnia or North-Arran island. And their metropolis Rheha was feated upon the lake Rhebius, and in the country of the Hardinii on the

"Upon the northern shore and along the margin of the Deucaledonian ocean, were only the Robogdii; inhabiting the reft of Donnegalle, all Derry, and all Antrim to the Fair-Head, and the Damnii; and giving their own name to the former and the division of Raphoe. And they had the rivers Vidua or Shipharbour, Arigta or Logh Swilly, Darabouna or Logh Foile, and Banna or Ban, in their territories; and acknowledged Robogdium, Robogh, or Raphoe, for their

chief city.

"The central regions of the island, all Tyrone, the remainder of Fermanagh and Letrim, all Monaghan, and the reft of Ardmagh; all Cavan, all Longford, and all West-Meath; all the King's and Oveen's county, all Kilkenny, and all Tipperary; were planted by the Scoti. The Shannon, Logh Allin, and Logh Erne, were their great boundaries on the west; the Barrow, Boyne, and Logh Neagh, on the eaft; the Swire and Blackwater on the fouth; and a chain of mountains on the north. And the two greatest of their towns were Rheba, a city feated, like the Rheba of the Venicnians, upon the lake and river Rhebius, but on a different part of them, and somewhere in the to become masters of Dublin, Limeric, Waterford, north of Cavan; and Ibernia, a town placed a little to the east of the Shannon, and somewhere in the county of Tipperary."

But whether we are to receive as truth the accounts given by Mr Whitaker, those of the Irish annalists, or any other, it is certain, that, till little more than a century ago, Ireland was a icene of confusion and flaughter. The Irish historians acknowledge this, as we have already feen. Very few of their monarchs escaped a violent death. The histories of their kings indeed amount to no more than this, viz. that they began to reign in fuch a year, reigned a certain number of years, and were flain in battle by the valiant prince who fucceeded to the throne. The introduction of Christianity feems to have mended the matter very little, or rather not at all. The same wars between the chiefs continued; and the same murders and treacheries took place among the inhabitants, till they Invasion of were invaded by the Danes or Normans, about the the Danes. end of the eighth century. At this time, we are told, that the monarchical power was weak, by reason of the

common, all Letrim as far as Logh Allin on the fouth- had confiderably fubfided by the respect paid to relieaft, and all Fermanagh to Balyshannon and Logh gion and learning. The first invasions of the Danes were made in small parties for the sake of plunder, and were repelled by the chieftain whose dominions were invaded. Other parties appeared in different parts of the island, and terrified the inhabitants by the havoc they committed. These were in like manner put to flight, but never failed to return in a short time; and in this manner was Ireland haraffed for the space of 20 years, before the inhabitants thought of putting an end to their intelline contells, and uniting against the common enemy. The northern pirates, either by force or treaty, gradually obtained fome fmall fettlements on the island; till at length Turges, or Turgefius, a warlike Norwegian, landed with a powerful armament in the year 815. He divided his fleet and army, in order to firike terror in different quarters. His followers plundered, burned, and maffacred, without mercy, and perfecuted the clergy in a dreadful manner on account of their religion. The Danes already fettled in Ireland, flocked to the standard of Turgefius, who thus was enabled to feat himfelf in Armagh, from which he expelled the clergy, and feized their lands. The Irish, in the mean time, were infatuated by their private quarrels; till at laft, after fome ill-conducted and unfuccefsful efforts, they funk into a flate of abject fubmission, and Turgesius was proclaimed monarch

of the whole island in 845.

The new king proved fuch a tyrant, that he foon became intolerable. A conspiracy was formed against him; and he was feized by Melachline prince of Meath, in a time of apparent peace. An universal insurrection enfued; the Danes were massacred or dispersed; their leader condemned to death for his cruelties, and drowned in a lake. The foreigners, however, were not exterminated, but the remains of them were allowed to continue on the island as subjects or tributaries to some particular chieftains. A new colony foon arrived, but under pretence of peaceable intentions, and a defign of enriching the country by commerce. The Irish, through an infatuated policy, suffered them and other maritime places, which they enlarged and fortified with fuch works as had till then been unknown in Ireland. The Danes did not fail to make use of every opportunity of enlarging their territories, and new wars quickly enfued. The Irish were sometimes victorious, and fometimes not; but were never able to drive out their enemies, fo that they continued to be a very diftinguished and powerful fept, or tribe, in Ireland. The wars with the Danes were no fooner at at end, than the natives, as usual, turned their arms against each other. The country was haraffed by the competitions of the chiefs; laws and religion loft their influence, and the most horrid licentiousness and immorality prevailed. Thus the whole island seemed ready to become a prey to the first invader, when an attempt was made upon it by Magnus king of Norway. This attempt miscarried, through his own rash. ness; for, having landed without opposition, he advanced into the country without the least apprehenfion. The confequence of this was, that he was furrounded and cut in pieces with all his followers. His factions and affuming disposition of the inferior dyna- death, however, proved of little benefit to Ireland;

Ireland, the fame diforders which had gradually reduced the the counties of Armagh, Monaghan, Lowth, and fome Ireland. English invasion, which happened in the reign of Hen-

Henry Il. meditates of Ireland.

ry II.

The first motives which induced this monarch to of England think of an expedition against Ireland are not well known. It was supposed that he had been provoked by fome affiltance which the Irish princes had given to the French; but, whatever might be in this, it is certain that the defign was conceived foon after he afeended the throne; and his flatterers foon furnished him with fufficient reasons for considering the Irish as his fubjects. It was affirmed that they had originally possessed themselves of their country by permission of Gurguntius a British king; and that, as defcendents of the Britons, they were the natural and rightful fubjects of the Euglish monarch. It was also fuggested, that the renowned King Arthur, Egfred the Northumbrian prince, and Edgar one of the Saxon kings of England, had all led their armies into Ireland, and there made valuable acquisitions, which their fucceffor was in honour bound to recover and maintain. All these suggestions, however, or whatever else had occurred to himself, feemed vet insufficient to Henry : and therefore he took the most effectual method to enfure his reputation, namely, by an application to the pope. To him he reprefented, that the inhabitants of Ireland were funk into the most wretched state of corruption, both with regard to morals and religion; that Henry, zealous for the honour and enlargement of God's kingdom, had conceived the pious defign of erecting it in this unhappy country; was ready to devote himfelf and all his powers to this meritorious fervice : implored the benediction of the pontiff ; and requelted his permission and authority to enter Ireland, to reduce the disobedient and corrupt, to eradicate all fin and wickedness, to instruct the ignorant, and spread the bleffed influence of the gospel in all its purity and perfection; promifing at the same time to pay a yearly tribute to St Peter from the land thus to be reduced to his obedience, and to the holy fee. Adrian, the reigning pope, rejoiced at this application which tended fo much to the advancement of his own power. Is invested A bull was therefore immediately formed, conformable to the most fanguine wishes of Henry, which was fent to England without delay, together with a ring, the token of his investiture as rightful fovereign of Ireland. But whatever inclination the king of England or the pope might at this time (A. D. 1156) have for the fubjection of Ireland, the fituation of the English affairs obliged him to defer it for fome time.

with the by the pope.

State of Ireland at that time.

The flate of Ireland, as we have already observed, was at this time extremely favourable for an invasion. The monarch enjoyed little more than a titular dignity, being haraffed by a faction, and opposed by powerful rivals. A number of chieftains who assumed the title and rights of royalty, paid a precarious tribute to their fuperior, and united, if they were difposed to unite, with him, rather as his allies than his fubjects. In Ulster, the family of the northern Hi Nial, as it was called, exercifed an hereditary jurifdiction over the counties now called Tirone, Derry, and Donnegal. They also claimed a right of supremacy over the lords of Fermanagh, Antrim, and Argial, which included

kingdom to a state of extreme weakness, still conti- adjacent districts: while Dunleve, prince of Uladh nued to operate, and to facilitate the success of the (now Down), disputed the superiority of this family, and affected an independent state. In Munster reigned the descendants of Brien, a famous fovereign of former times, impatient to recover the honours of their family; but at last, being confined by powerful rivals to the territory of North Munster, they were obliged to leave the family of Mac Arthy fovereigns of Defmond, the fouthern divition. In Connaught, the princes known by the name of O'Connor were acknowledged fovereigns of the eaftern territory. Tiernan O'Ruarc, an active and reftlefs military chief, had the fupremacy in Breffney, containing the modern county of Leitrim, and fome adjacent diffricts. Meath, or the fouthern Hi-Nial, was fubject to the family of Clan-Colman, Murchard O'Malachlyn, and his fucceffors. Leinster, divided into feveral principalities, was subject to Dermod, a fierce, haughty, and oppreffive tyrant. His father had governed with great cruelty. Seventeen of his vaffal lords had been either put to death, or had their eyes put out, by his order in one year ; and Dermod feemed to inherit too great a portion of the fame temper. His flature and bodily ftrength made him admired by the inferior orders of his fubjects, and these he was careful to protect and favour. His donations and endowments of religious houses recommended him to the clergy; but his tributary chieftains felt the weight of his pride and tyranny, and to them his government was extremely

The chief competitors for the rank of monarch of Ireland, in the mean time, were, the heirs of the two houses of O'Connor, and the northern Hi Nial. Torlogh O'Connor was in poffession; but he was not generally recognifed, and was opposed by his rival O'Lochlan: not with standing which, he maintained his dignity with magnificence and vigour, till a decifive victory gained by him over O'Brien raifed O'Lochlan's jealoufy fo much, that he obliged him in a convention of the states, to allow him the sovereignty of the northern division. In consequence of this partition, it was refolved to transfer the territory of O'Ruarc to a perfon more inclined to the interests of the two fovereigns. An expedition was accordingly undertaken; O'Ruarc was surprifed, defeated, and driven from his dominions. Dermod, who had conceived an unlawful paffion for Dervorghal, the wife of O'Ruarc, took the opportunity of her hufbaud's dittreffes to carry her off in triumph. O'Ruarc conceived the most implacable refentment against Dermod; and therefore applying himself to Torlogh, promifed an inviolable attachment to his interest; and prevailed on him not only to reinstate him in his possessions, but to revenge the insult offered by Dermod, and to restore his wife. By means of fuch a powerful ally, O'Ruarc found frequent opportunities of haraffing his antagonist till the death of Torlogh, which happened in 1156, upon which O'Lochlan fucceeded to the fovereignty. Dermod was the first to acknowledge the authority of this new fovereign, by whose means he hoped to be able to revenge himfelf on O'Ruarc. He foon found, however, that he had acted too precipitately. His patron, having treacherously feized and put out the eyes of Dunleve prince of Down, the neighbouring chieftains took

Dermod,

an exiled

Henry II.

Ireland, arms, in order to fecure themselves from his barbarity. O'Lochlan was defeated and killed; upon which the his rights. monarchy devolved on Roderic the fon of the late Torlogh O'Connor.

The new prince had acquired the reputation of valour, and was determined to establish this reputation by fome remarkable exploit in the beginning of his reign. Having therefore engaged in his fervice the Offmen, or descendants of the Danes, he marched against Dermod as the chief partizan of his fallen rival. The king of Leinster was feized with the utmost confternation; and in despair set fire to his own town of Ferns, left the enemy should have the satisfaction of fooiling it. Roderic ftill advanced, attended by O'Ruarc, Dermod's implacable enemy, and foon over-ran the whole province. All the inferior lords at once acknowledged Roderic's authority. Dermod was depoprince, fofed, as a man utterly unworthy of his flation; another of his family was raifed to the throne; and the unforance from tunate prince, finding it impossible to stay with fafety in Ireland, embarked with 60 of his followers for England, and foon arrived at the port of Briftol, with a defign to folicit affiltance from king Henry.

In England, Dermod's character was unknown, and he was regarded as an injured prince driven from his throne by an iniquitous confederacy. The clergy received him as the benefactor of their order, and entertained him in the monastery of Augustines with great hospitality. Having learned that Henry was then in Aquitain, he immediately went thither, and in a very abject manner implored his affiftance, promiting to acknowledge him as his liege lord, and to hold his dominions, which he was thus confident of regaining, in

vassalage to Henry and his heirs.

Though nothing could be more flattering to the ambition of the king of England than this fervile addrefs, yet the fituation of his own affairs rendered it impossible for him at that time to reap from it any of the advantages with which it flattered him. He therefore difmiffed the Irish prince with large prefents, and a letter of credence addressed to all his subjects; notifying his grace and protection granted to the king of Leinster; and declaring, that whosoever within his dominions should be disposed to aid the unfortunate prince in the recovery of his kingdom, might be affured

of his free licence and royal favour.

Dermod returned to England highly pleafed with the reception he had met with; but notwithstanding the king's letter, none of the English seemed to be disposed to try their fortunes in Ireland. A month elapfed without any prospect of succours, so that Dermod began to despair. At last, however, he perfuaded, with great promises, Richard Earl of Chepstow, or. as it was formerly called, Strigul, a nobleman of confiderable influence in Wales, but of broken fortune, to affift him with a confiderable force to be transported next fpring into Ireland. Overjoyed at this first instance of fuccess, he advanced into South Wales, where, by the influence of the bishop of St David's, he procured many other friends. Robert Fitz-Stephen, a brave and experienced officer, covenanted with him to engage in his fervice with all his followers, and Maurice Fitz-Gerald his maternal brother; while Dermod, on his part, promifed to cede to the two principal leaders, Fitz-Stephen and Fitz-Gerald, the entire dominion of lift, condefcended to treat first with them, and then the town of Wexford, with a large adjoining territory, with Dermod, in order to detach them from the inte-

as foon as by their affiftance he should be reinstated in Ireland.

The Irish prince having now accomplished his purpole, fet fail for Ireland in the winter of 1160, and recovered a small part of his dominions even before the arrival of his new allies; but being attacked with a fuperior force by his old enemies Roderic and O'Ruarc, he found himfelf obliged to feign fubmiffion till the English allies came to his affistance. The expected fuccours arrived in the month of May 1170, in a creek called the Bann, near the city of Wexford. Robert Fitz-Stephen commanded 30 knights, 60 men in armour, and 300 archers. With these came Harvev of Mountmorris, nephew to earl Richard. He had no military force along with him; but came folely with a view of discovering the nature of the country, and reporting it to his uncle. Maurice of Pendergaft commanded 10 knights and 200 archers: and thus the English force which was to contend with the whole strength of Ireland, amounted to no more than 600

Triffing as this affiftance may feem, it nevertheless Their fues changed the face of affairs almost instantaneously. cels Numbers of Dermod's subjects, who had abandoned him in his diffress, now flocked to his flandard. Wexford was immediately attacked, and furrendered in a few days; Fitz Stephen and Fitz-Gerald were jointly invested with the lordship of this city and its domain; and Harvey of Mountmorris was declared lord of two confiderable districts on the coast. After three or four weeks fpent in feating and rejoicing, a new expedition was undertaken against the prince of Offory (a district of Leinster), who had not only revolted from Dermod. but put out the eyes of one of his fons, and that with fuch cruelty, that the unhappy youth expired under the operation. The allied army was now increased to 3000 men, who were opposed by the prince of Offory at the head of 5000, strongly entrenched among woods and moraffes. By the fuperior conduct of the English troops, however, the Irish were decoyed from their advantageous fituation, and thus were entirely defeated. The English were for keeping the field till they had totally reduced their enemies: but Dermod, accuftomed only to ravage and plunder, contented himfelf with destroying the country; and a sudden reverse of fortune feemed ready to take place. The prince of Offory, though defeated, still appeared in arms, and only waited for an opportunity of again oppofing the enemy in the field. Maurice Pendergast also joined him with his whole troop, being provoked by Dermod, who had refused him leave to return to Wales. This defection, however, was in part supplied by the arrival of Fitz-Gerald with 10 knights, 30 horsemen, and 100 archers. Pendergast in a short time repented of his new alliance, and retired into Wales; fo that the prince was obliged to make his submission to Dermod, which the latter with fome reluctance accepted.

In the mean time, Roderick, having fettled all his other affairs, advanced against the allies with a powerful army. Dermod was thrown into despair; but, encouraged by Fitz Stephen, he encamped in a very ftrong fituation, where he was foon befieged by Roderic, The latter, however, dreading the valour of the Eng-

fome adventurers to follow

val of their affociates.

chuted.

from fear, his offers were rejected by both parties; upon which he began to prepare for battle : but at the very time when the engagement should have commenced, either through the fuggettions of his clergy, or of his own fears. Roderic entered into a new negociation; which at last terminated in a peace. The terms were, Peace conthat Dermod should acknowledge the supremacy of Roderic, and pay him fuch fervice as the monarchs of Ireland had usually received from inferior princes; and as a fecurity for his faithful performance of this article, he delivered up his favourite fon as an hostage to Roderic: but in order to establish this accommodation on the firmed basis, the latter obliged himself to give his daughter in marriage to the young prince as foon as Leinster should be reduced, and the peace of the island effectually restored. By a secret article, Dermod envaged to difmiss the British forces immediately after the fettlement of his own province, and in the mean time not to bring over any further reinforcements from

Thus ended the first British expedition into Ireland; the confequences of which were so little dreaded at that time by the natives, that their historians, though they dwell upon the principal wars and contests in other parts of the island, speak of the settlement of the Welshmen in Leinster with a careless indifference. But though the fettlement of this colony feemed very little alarming to the generality, it could not escape the obfervation of discerning persons, that a man of Dermod's character would not long keep his treaties; and that on the first emergency he would have recourse to his former allies, who thus would establish themselves more and more, till at last they would reduce the country entirely under their subjection. These reslections, if any foch were then made, were in a short time verified. of Dermod. Dermod was fcarce fettled in his own dominions, when he began to aspire at the sovereignty, and form schemes for dethroning Roderic. He applied to Fitz-Stephen and Fitz-Gerald; by whom he was again directed to apply to Richard earl of Chepflow, more commonly known by the name of Strongbow, on account of his feats of archery. Richard was very much inclined to accept of his invitation; but thought it incumbent upon him first to obtain the confent of king Henry. The king, however, did not incline that his fubiccts should make conquests for themselves in any other country, and therefore dismissed Richard with an equivocal answer; but the latter being willing to understand his fovereign's words in the most favourable fense, immediately set about the necessary preparations A new bo- for his expedition. In May 1171, Raymond le Gross. dy of Eng- Richard's domestic friend, and the near relation of Fitz-Stephen and Fitz-Gerald, landed at a place called Dondonalf, near Waterford, with 10 knights and 70 archers; and along with them came Harvey of Mountmorris, attended by a small train. The English immediately intrenched themselves, and erected a temporary fort for themselves: which proved a very necessary precaution; for the natives, juftly attributing this new debarkation to the practices of Dermod, inflantly formed a tumultuous army, and marched to expel the invaders. The English prepared to meet them; but when they perceived the great superiority of the enemy,

treland, refts of each other; but as this proceeded evidently they thought proper to retire to their fort. Here, Ireland, however, they must have been totally cut off, had they not luckily collected a numerous herd of cattle from 14 the neighbouring country for their subsistence. These cess and they drove with fury among the Irish, who were thus crueity. put into the utmost confusion. The invaders seized the favourable moment; and, falling upon their difordered enemies, put them to flight, and drove great numbers of them into the fea, where they perished. Seventy prisoners were taken, all of them principal citizens of Waterford; who, though they offered large fums for their ranfom, and even that the city should be delivered up to the English, were all barbarously put to death. This success and cruelty so intimidated the Irish, that they suffered these merciles invaders to maintain their station unmolested, and wait for the arri-

> fals, led them through Wales, where he was joined by great numbers of other adventurers; but, when just on the point of embarking, was furprifed by a politive command from the king, to defilt from his intended enterprize, on pain of forfeiture of his lands and honours. He was now, however, too much interested in his scheme to retract; and therefore pretended to difbelieve the authenticity of the royal mandate. On Farl Rich. the eve of the feast of St Bartholomew, he landed at ard arrives Waterford with 200 knights and 1200 infantry, all with a chofen and well appointed foldiers. They were imme-powerful

Richard in the mean time having affembled his vaf-

diately joined by Raymond and his troop; and the ment. very next day it was refolved to make an attempt upon Waterford. The city was taken by ftorm, and a dreadful massacre ensued; to which the cruel Dermod had the merit of putting an end. The marriage of Richard with Eva, the daughter of Dermod, was folemnized without delay, and a fcene of joy and feltivity fucceeded the calamities of war.

A new expedition was now undertaken against Dublin: the inhabitants of which had either manifested some recent disaffection to Dermod, or had never been thoroughly forgiven for their old defection. Roderic advanced against the allied army with a formidable body, confifting, as is faid, of 30,000 men: but, fearing to come to a general engagement, he. contented himself with some slight skirmishes; after which, great part of his valials forced him to difmifs them, and Dublin was left to its fate. The inhabitants were treated very feverely; however, a confide: ble body of them, with Hefculph their governor, had be good fortune to gain some vessels lying in the ha. bour, and made their escape to the northern islands. Earl Richard was now invefted with the lordship of Dublin; and appointed Milo de Cogan, a brave English knight, his governor; while he himself, in conjunction with the forces of Dermod, over-ran the country of Meath, committing every where the most horrid cruelties. Roderic, in the mean time, unable to oppose them in the field, fent deputies to Dermod, commanding him to retire, and putting him in mind that his fon was in his hands, and must answer with his life for the breach of those treaties which his father made fo little scruple to violate. Natural affection, however, had very little place in the breatt of Dermod. He expressed the utmost judifference about his son; and, with

New ma

lifh arrive in Ireland. Ireland, the greatest arrogance, claimed the fovereignty of all answer, probably of his own framing; namely, that Ireland Ireland : Roderic, provoked at this answer, cut off the

young prince's head.

This piece of impotent cruelty ferved only to make the king odious to his own ful jects, while Dermod and his English allies committed every where the greatest devastations, and threatened to subdue the whole island. This indeed they would probably have accomplished, had not the extraordinary fuccess of Strongbow alarmed king Henry; who, fearing that he might render himself totally independent on the crown of Britain, iffued his royal edict, frictly forbidding any English veffel from paffing into Ireland with men, arms, or All the adprovisions; and commanding all his subjects at that recalled by time relident in Ireland, of whatever rank or degree, to return to their country before the enfuing feast of the king. ERher, on pain of forfeiting their lands, and being

Our adventurers were plunged into the greatest difirefs by this peremptory edict. They now found themselves cut off from all supplies in the midst of their enraged enemies, and in danger of being forfaken by those who had attached themselves to them during their fuccess. Raymond was dispatched with a most fubmissive message to the offended monarch; but before he received any favourable answer, every thing was . See Eng. thrown into confusion by the death of Becket *, fo land, no119, that the king had neither leifure nor inclination to

attend to the affairs of Ireland. About the fame time Diffres of give a finishing stroke to the English affairs. An uni-

the death of Dermod their great ally scemed almost to the English verfal defection took place among their affociates; and before they had time to concert any proper measures, Hefeulph, who had formerly escaped from Dublin, appeared before that city with a formidable hody of troops armed after the Danish manner. A furious attack enfued; which at last ended in the defeat and captivity of Hefculph, who was immediately put to death. This danger, however, was foon followed by one still greater. Roderic had formed a powerful confederacy with many of the Irish chieftains, and the kings of the northern ifles, in order to extirpate the English totally from the island. The harbour of Dublin was blocked up by a fleet of 30 ships from the northern ifles; while the confederated Irish took their flations in such a manner as to surround the city, and totally cut off all supplies of provisions. In two months time the English were reduced to great straits. On the first alarm, Richard had fent for affiltance to Fitz-Stephen; who having weakened his own force, in order to ferve the earl, the people of Wexford had rifen and befieged Fitz-Stephen in his fort called Carrig near that city. A meffenger now arrived, informing Strongbow that his friend was in the utmost danger, within three days; upon which a council of war was called, in order to deliberate on the measures necessary to be purfued in this desperate emergency. It was soon refolved to enter into a treaty with Roderic upon any terms that were not totally fervile or oppressive. Laurence prelate of Dublin was appointed to carry the terms; which were, that Richard proposed to acknowledge Roderic as his fovereign, and to hold the province of Leinster as his vassal, provided he would raise the siege. Laurence foon returned with an

Dublin, Waterford, Wexford, and all the forts poffeffed by the British, should be immediately given up; and that the earl and his affociates should depart with all their forces by a certain day, leaving every part of the island free from their usurpations, and absolutely renouncing all their pretended claims. On these conditions they were to be spared; but the least reluctance or delay would determine the believers to from the

Thefe terms, though they contained nothing infolent or unreasonable, confidering the present fitnation of the English, were yet intolerable to our indigent adventurers. After fome time spent in silence, Milo de Cogan, fuddenly flarting up, declared his refolution to die bravely rather than fubmit to the mercy of barbarians. The fpirit of desperate valour was inflantly caught by the whole affembly; and it was refolved to risk their whole fortune on one desperate effort, by fallying out against the enemy, and to make their attack upon that quarter where Roderic himfelf commanded. Accordingly, having perfuaded a body They totalof the townsmen to take part in this desperate enter-ly deseat prife, they marched out against their enemies, who their eneexpected nothing lefs than fuch a fudden attack. The befingers were fecure and carelefs, without discipline or order; in consequence of which, they were unable to fustain the furious affault of the English. A terrible flaughter enfued, and the Irifh inflantly fled in the greatest confusion; their monarch himself escaping only by mixing half naked with the crowd. The other chieftains who were not attacked caught the panic. and broke up their camps with precipitation; while the victors returned from the pursuit to plunder, and among other advantages gained as much provision as was fufficient to fupport them for a whole year.

Strongbow being thus relieved from his diffrefs. committed the government of Dublin to Milo de Cogan, while he proceeded immediately to Wexford in order to relieve Fitz-Stephen : but in this he was difappointed; for that brave officer, having often repulfed his enemies, was at last treacherously deceived into submission and laid in irous. Strongbow, however, continued to advance; and was again attacked by the Irish, whom he once more defeated. On his arrival at Wexford, he found it burnt to the ground ; the enemy having retired with Fitz-Stephen and the reft of the prisoners to Holy Island, a small island in the middle of the harbour, from whence they fent a deputation, threatening to put all the prifoners to death if the least attempt was made to molest them in their prefent fituation. The earl then proceeded to Waterford, and from thence to Ferns; where he for finne time exercifed a regal authority, rewarding his friends and punithing his enemies. A more important object, however, foon engaged his attention. The king of England having fettled his affairs as well as he could, now determined to conquer

Treland for himfelf. A fummons was inflantly dif-Earl Richpatched to earl Richard, expressing the greatest refent- ard summent at his prefumption and difobedience, and requi-moned to ring his immediate prefence in England. The earl England. found himself under a necessity of obeying; and having made the best dispositions the time would permit for the fecurity of his Irish possessions, embarked for England, and met the king at Newnham near Glou-

Ireland. cefter. Henry at first affected great displeasure; but foon allowed himself to be pacified by a surrender of the city of Dublin, and a large territory adjacent, together with all the maritime towns and forts acquired by Strongbow : while on his part he confented that the earl should have all his other possessions granted in per-petuity, to be held of the king and his heirs. The other adventurers made their peace in a fimilar manner: while the Trift chieftains, instead of uniting in the defence of their country, only thought how to make the most of the approaching invasion, or at least how to avert the threatened evils from their own particular diffricts. They faw the power of their own fovereign on the point of total diffolution; and they faw it with indifference, if not with an envious and malignant fatisfaction. Some were even ready to prevent their invader, and to fubmit before he appeared on the coast. The men of Wexford, who had possesfed themselves of Fitz-Stephen, resolved to avert the confequences of their late perfidy and cruelty, by the forwardness of their zeal for the service of the king of England, and the readiness of their submissions. Their deputies cast themselves at Henry's feet; and, with the most passionate expressions of obedience, humbly intreated that he would accept them as his faithful vaffals, ready to refign themselves, their lands, and pos-Teffions, to his absolute disposal. " They had already (they faid) endeavoured to approve their zeal by feizing Robert Fitz-Stephen, a traitor to his fovereign, who had lately entered their territory by force of arms without any due warrant or fair pretence, had flaughtered their people, feized their lands, and attempted to establish himself independent of his liege lord. They kept him in chains, and were ready to deliver him to the difpolal of his fovereign."—The king received them with expressions of the utmost grace and favour : commended their zeal in repressing the unwarrantable attempts of Fitz-Stephen; declared that he fhould foon inquire into his crimes, and the wrongs they had fustained, and inflict condign punishment for every offence committed by his undutiful fubjects .-Thus were the Irishmen dismissed in the utmost joy and exultation; and the artifice of Henry, while it inspired these men with dispositions favourable to his interests, proved also the most effectual means of faving Fitz-Stephen from their cruelty. Henry, having completed the preparations necessary

for his expedition, embarked at Milford with feveral of his barons, 400 knights, and about 4000 foldiers, King Hen- on board a fleet of 240 fail. He landed at Waterwy lands in ford on the feast of St Luke in October 1172; with a professed defign not to conquer, but to take possession of a kingdom already his own, as being granted him by the pope. Most of the Irish indeed seemed to be of the same opinion, and therefore submitted without the least refistance. Strongbow fet them an example, by making a formal furrender of Waterford, and doing homage to the king for the territory of Leinster. Fitz-Stephen was delivered up, with many accufations of tyranny and injustice. He was at first fent to prifon; but foon purchased his liberty, by surrendering Wexford, and doing homage for the rest of his possesfions to the king. The prince of Defmond was the first Irish chieftain who submitted. On the very day after the king's arrival, he attended his court, refigned

Many Irish chieftains Lubmit to him. Nº 168. the city of Corke, did him homage, and flipulated to Ireland. pay a tribute for the rest of his territory. An English governor and garrison were immediately appointed to take poffession of his capital; and the king displayed his power and magnificence by marching to Lifmore, where he chose a fituation and gave the necessary orders for building a fort. The prince of Thomond next fubmitted and did homage. He was followed by the princes of Offory, Decies, and all the inferior chiefs of Munster.

The king, after having provided for the fecurity of all his newly acquired territories, and put garrifons in the cities of Limerick, Corke, Waterford, and Wexford, proceeded to take poffession of Dublin, which had been furrendered by Strongbow. The neighbouring lords took the opportunity of submitting as he advanced. O'Carrol of Argial, a chieftain of great confequence, repaired to his camp, and engaged to become his tributary; and even O'Ruarc, whom Roderic had made lord of a confiderable part of Meath, voluntari-

ly fubmitted to the new fovereign.

Roderic, though surprifed at the defection of so Roderic many of his allies, still determined to maintain his own still holds dignity, and at least preserve his province of Con-out, naught, feeing he could no longer call himfelf monarch of the whole island. With this defign he entrenched himself on the banks of the Shannon; and now, when difencumbered from a crowd of faithless and discontented followers, he appears to have acted with a spirit and dignity becoming his flation. Hugh de Lacy and William Fitz-Andelm were commissioned by the king to reduce him ; but Roderic was too ftrong to be attacked with any probability of fuccess by a detachment from the English army; and he at least affected to believe, that his fituation was not yet fo totally desperate as to reduce him to the necessity of refigning his dignity and authority, while his own territory remained inviolate, and the brave and powerful chiefs of Ulster still kept retired in their own districts without any thoughts of fubmiffion. Henry in the mean time attempted to attach the Irish lords to his interest by elegant and magnificent entertainments, such as to them appeared quite aftonishing. Some historians pretend that he established the English laws in all those parts which had submitted to his jurisdiction; but this must appear extremely improbable, when we confider how tenacious a rude and barbarous people are of their ancient laws and customs. The Irish lords had been accustomed to do homage to a superior; and they had made no submission to Henry which they had not formerly done to Roderic, and probably thought their fubmission to the king of England more honourable than that to their Irish monarchs; and it cannot be supposed, that a wife and politic monarch, such as Henry undoubtedly was, should form at once such an extravagant scheme as altering the laws of a great number of communities, none of which he had fubdued by force of arms. By his transactions both with the natives and adventurers, however, Henry had attained the absolute dominion of several maritime cities and their dependencies; fo that he had both a confiderable number of real subjects, and a large extent of territory, in the island. To these subjects indeed Henry granted the English laws; and gave the city of Dublin by charter to the inhabitants of Briftol, to be held of

Tienry ob Liged to

fand.

Greland, him and his heirs, with the fame liberties and free cuf- Philip of Hastings, and Philip de Braofa, with a like Ireland. wherever they and their effects shall be, to be fully and honourably enjoyed by them as his free and faithful fuljects. And as it was not eafy to induce his Englift subjects immediately to settle in these maritime towns, he permitted the Ostmen to take possession of Waterford; and to them he granted a particular right of denization, whereby they were invested with the rights and privileges of free subjects, and for the future to be governed by the laws of his realm. For the better execution of these new laws, the king also made a division of the districts now subject to him into shires or counties; which was afterwards improved and enlarged, as the extension of the English settlements and the circumstances of the country required. Sheriffs were appointed both for the counties and cities, with itinerant judges, and other ministers of justice, and officers of state, and every appendage of English government and law. To complete the whole fystem, a chief governor, or reprefentative of the king, was appointed. His bufiness was to exercise the royal authority, or fuch parts of it as might be committed to him in the king's absence; and, as the prefent state of Ireland, and the apprelienfions of war or infurrections, made it necessary to guard against sudden accidents, it was provided, That in case of the death of any chief governor, the chancellor, treasurer, chiefjustice, and chief baron, keeper of the rolls, and king's ferjeant at law, should be empowered, with confent of the nobles of the land, to elect a fuccessor, who was to exercife the full power and authority of this office, until the royal pleasure should be further

But while Henry was thus regulating the government of his new dominions, he received the unwelcome news, that two cardinals, Albert and Theodine, delegated by the pope, had arrived in Normandy the year before, to make inquifition into the death of Becket; that having waited the king's arrival until their patience was exhaufted, they now fummoned him to appear without delay, as he would avert the dreadful fentence of excommunication, and preferve his dominions from a general interdict. Such denunciations were of too great confequence to admit of his longer flay in Ireland; he therefore ordered his forces and the officers of his household to embark without delay, referving three ships for the conveyance of himself and his immediate attendants. Having therefore but a short time to secure his Irish interests, he addressed himself to the original English adventurers, and by grants and promifes laboured to detach them from Strongbow, and to bind them firmly to himself. To make amends for what he had taken from Fitz-Stephen, he granted him a confiderable diffrict in the neighbourhood of Dublin, to be held by knight's fervice; at the same time entrusting the maritime towns to his own immediate dependants. Waterford was committed to Humphrey de Bohun, Robert Fitz-Bernard, and Hugh de Gundville, with a train of 20 knights. In Wexford were stationed William Fitz-Andelm, king's deputy in Ireland, their infidious practices Vol. IX. Part I.

toms which they enjoyed at Briftol, and throughout number of attendants. Hugh de Lacy had a grant all his land. And, by another charter, executed foon of all the territory of Meath, where there was no after, he confirmed to his burgeffes of Dublin all man- fortified place, and where of confequence no parner of rights and immunities throughout his whole ticular refervation was necessary, to be held of the king land of England, Normandy, Wales, and Ireland, and his heirs, by the fervice of 50 knights, in as full a manner as it had been enjoyed by any of the Irish princes. He also constituted him lord governor of Dublin, with a guard of 20 knights. Robert Fitz-Stephen and Maurice Fitz-Gerald were appointed his coadjutors, with an equal train; and thefe, with others of the first adventurers, were thus obliged, under the pretence of an honourable employment, to refide at Dublin, subject to the immediate inspection of de Lacy, in whom Henry feems to have placed his chief confidence. Lands were affigned in the neighbourhood of each city for the maintenance of the knights and foldiers. Orders were given to build a caftle in Dublin, and fortreffes in other convenient places; and to John de Courcey, a baron diftinguished by his enterprifing genius and abilities for war, was granted the whole province of Ulster, provided he could reduce it by force of arms.

Henry was no fooner gone, than his barons began Diforders to contrive how they might best strengthen their own ensue on interests, and the Irish how they might best shake off the king's the yoke to which they had fo readily submitted. De departures Lacy parcelled out the lands of Meath to his friends and adherents, and began to erect forts to keep the old inhabitants in awe. This gave offence to O'Ruarc. who still enjoyed the eastern part of this territory as a tributary prince. He repaired to Dublin, in order to obtain redrefs from Lacy for fome injuries real or pretended; but, as the parties could not come to an agree. ment, another conference was appointed on a hill called Taragh. Both parties came with a confiderable train of armed followers; and the event was a fcuffle, in which O'Ruarc and feveral of his followers were killed, and which ferved to render the English not a

little odious to the natives.

The spirit of disaffection had soon after an opportunity of showing itself on the rebellion of king Henry's fons, of which an account is given under the article England, no 121. & feq. The king had been obliged to weaken his forces in Ireland, by withdrawing feveral of his garrifons. The foldiers who remained were also discontented with their general Hervey of Mountmorris, on account of his feverity in discipline, and reffraining them from plunder, to which they imagined themselves intitled on account of the deficiencies of their pay. Raymond le Gros, the fecond in command, was much more beloved by the foldiery: and to fuch a height had the jealoufies between the commanders arisen, that all effectual opposition to the Irish chieftains was prevented; and the event might have been fatal to the English inte
25

Strongbow reft, had not Henry found out a remedy. He fum-Strongtow moned earl Richard to attend him at Rouen in Nor-versor of mandy, and communicated his intentions of commit-Ireland. ting the affairs of Ireland to his fole direction. The earl expressed the utmost readiness to serve his master: but observed, that he had already experienced the envy

and malignity of his fecret enemies; that if he should

He therefore requested that a colleague might be ap- flyled, chancellor to the king of Connaught. pointed in the commission; and recommended Raymond as a perfon of approved loyalty and abilities, as came fole monarch of Ireland, were as follow: Ro his submitleague, but as an affiftant; but that he relied entirely on the earl himself, and implicitly trusted every thing to his direction. To reward his fervices, he granted him the town of Wexford, together with a fort erected at Wicklow; and then difmiffed him with the most gracious expressions of favour.

The earl landed at Dublin, where he was received fignified the king's pleafure, that Robert Fitz-Bernard. fervice of their fovereign in England; and, agreeably to the king's inftructions, took on him the cuflody of the cities of Dublin, Waterford, and Wexford. Hugh de Lacy, and Milo de Cogan, were, with the other lords, commanded to repair to England for the fervice of the king; by which the earl's forces were confiderably weakened, and he foon found himself under a necessity of appointing Raymond to the chief command. The new general proved successful in some enterprizes against the rebellious Irish; but having prefumed upon his merits to demand in marriage Bafilia the earl's fifter, Richard refused his consent, and

Raymond retired into Wales.

Thus the fupreme command again devolved upon Hervey of Mountmorris; who, being fenfible that his character had fuffered much from a comparison with that of Raymond, determined to emulate his fuccesses by fome bold attempt against the rebels. A detachment of 400 of his men, however, had the misfortune to be furprized and cut off by the enemy; and this fuccess served as a signal for a general revolt. Several of the Leinster chieftains, who had lately made their fubmissions, and bound themselves to the service of king Henry, now openly disclaimed all engagements. Even Donald Kevanagh, fon to the late king Dermod, who had hitherto adhered to the English in their greatest difficulties, now declared against them, and claimed a right-to the kingdom of Leinster; while Roderic, on his part, was active in uniting the princes of Ulster, the native lords of Meath, and other chiefs, against their common enemy. This produced the immediate recal of Raymond; and Richard no longer refused his confent to the marriage with his fifter, which was folemnized immediately on Raymond's arrival. The very next morning, the bridegroom was obliged to take the field against Roderic, who had committed great devastations in Meath. By the vigorous conduct of the English commander, however, he was not only prevented from doing farther mischief. fubject; and therefore, instead of treating with earl to take arms against the king of England. Richard, he fent deputies directly to the king. The

Ireland. wu'd be renewed, and his conduct mifrepresented. abbot of St Brandan, and Mafter Lawrence, as he is Ireland.

The terms of this submission, by which Henry be- Terms of well as highly acceptable to the foldiery. The king deric confented to do homage and pay tribute, as foot replied, with an affected air of regard and confidence, liege-man to the king of England; on which condithat he had his free confent to employ Raymond in tion he was allowed to hold the kingdom of Conany fervice he should deem necessary, not as a col- naught, as well as his other lands and sovereignties, in as ample a manner as he had enjoyed them before the arrival of Henry in Ireland. His vaffals were to hold under him in peace, as long as they paid their tribute and continued faithful to the king of England; in which Roderic was to enforce their due obedience, and for this purpose to call to his affishance the English government, if necessary. The annual tribute to with all the respect due to the royal commission. He be paid was every toth merchantable hide, as well from Connaught as from the rest of the island; exwith the garrison of Waterford, should instantly em- cepting those parts under the immediate dominion of bark and repair to Normandy; that Robert Fitz- the king of England and his barons, viz. Dublin and Stephen, and Maurice Pendergaft, should attend the Meath with their appurtenances, Wexford and all Leinster, and Waterford with its lands as far as Dungarvan inclusive; in all which diffricts Roderic was not to interfere, nor claim any power or authority. The Irish who had fled from these districts were to return, and either pay their tribute, or perform the fervices required by their tenures, at the option of their immediate lords; and, if refractory, Roderic, at the requisition of their lords, was to compel them to return. He was to take hoftages from his vaffals. fuch as he and his liege lord should think proper; and on his part to deliver either these or others to the king, according to the royal pleasure. His vasfals were to furnish hawks and hounds annually to the English monarch; and were not to detain any tenant of his immediate demefnes in Ireland, contrary to his royal pleasure and command. This treaty was solemnly ratified in a grand council of prelates and temporal barons, among whom we find the archbithop of Dublin one of the subscribing witnesses. As metropolitan of Leinster, he was now become an English fubject, and was probably fummoned on this occasion as one obliged to attend, and who had a right to affift in the king's great council. It is also observable, that Henry now treated with Roderic not merely as a provincial prince, but as monarch of Ireland. This is evidently implied and supposed in the articles; although his monarchical powers and privileges were little more than nominal, frequently difregarded and opposed by the Irish toparchs. Even by their submissions to Henry, many of them in effect disavowed. and renounced the fovereignty of Roderic; but now his fupremacy feems to be industriously acknowledged, that the present submission might appear virtually the fubmission of all the subordinate princes, and thus the king of England be invefted with the fovereignty of the whole island. The marks of fovereignty, however, were no more than homage and tribute: in every otherparticular, the regal rights of Roderic were left inviolate. The English laws were only to be enforced in but at last convinced of the folly of resistance; and the English pale: and, even there, the Irish tenant therefore determined to make a final submission. Yet, might live in peace, as the subject of the Irish moconscious of his dignity, he disdained to submit to a narch; bound only to pay his quota of tribute, and not But though the whole island of Ireland thus be-

Carifes of the fubfequent diftreffes of Ireland.

treland, being fettled in tranquillity, or indeed from having native Irifh, provoked by fome depredations of the Ireland. the fituation of its inhabitants mended almost in any degree. One great occasion of disturbance was, that the English laws were confined only to those parts which had been subdued by force of arms; while the chieftains that had only fubmitted to pay tribute, were allowed to retain the ancient Irish laws within the limits of their own jurifdictions. By these old Irish laws, many crimes accounted capital with us, fuch as robbery, murder, &c. might be compensated by a sum of money. Hence it happened, that very unequal punishments were inflicted for the same offence. If one Englishman killed another, he was punished with death; but if he killed an Irishman, he was punished only by a fine. If an Irishman, on the other hand, killed an Englishman, he was certainly punished with death: and as in times of violence and outrage, the crime of murder was very frequent, the circumstance just mentioned tended to produce an implacable hatred between the original inhabitants and the English. As the Irish laws were thus more favourable to the barbarity natural to the tempers of fome individuals, many of the English were also tempted to lav aside the manners and customs of their countrymen altogether, and to affociate themselves with the Irish, that, by becoming subject to their laws, they might thus have an opportunity of gratifying their brutal inclinations with lefs controul than formerly; and in process of time, these degenerate English, as they were called, proved more bitter enemies to their countrymen than even the Irish themselves.

Another canfe of the diffresses of Ireland was, the great power of the English barons, among whom Henry had divided the greatest part of his Irish dominions. The extent of their authority only inflamed them with a defire for more; and, instead of contributing their endeavours to increase the power of their fovereign, or to civilize the barbarous people over whom they were placed, they did every thing in their power to counteract and destroy each other. Henry himself, indeed, seems to have been infected with a very fatal jealoufy in this respect; for, though the abilities and fidelity of Raymond had abundantly manifested themselves, the king never could allow himself to continue him in the government of the island: and the consequence of degrading him never failed to be a feene of uproar and confusion. To these two reasons we must likewise add another; namely, that in those parts of the kingdom where the Irish chieftains enjoyed the fovereignty, they were at full liberty to make war upon each other as formerly, without the least restraint. This likewife induced many of the English to degenerate, that they might have an opportunity of fharing the plunder got by these petty wars; fo that, on the whole, the island was a perpetual scene of horsor, almost unequalled in the history of any country.

After the death of earl Richard, Raymond was imdelm's bad mediately elected to fucceed him; but was superfeded by the king, who appointed William Fitz-Andelm, a nobleman allied to Raymond, to succeed in his place. The new governor had neither inclination nor abilities to perform the talk affigned to him. He was of a rapacious temper, fenfual and corrupt in his manners; and therefore only studied to enrich himself. The

English, commenced hostilities; but Fitz-Andelm, instead of repressing these with vigour in the beginning. treated the chieftains with affected courtely and flattery. This they had fufficient difcernment to fee. and to despife; while the original adventurers had the burden of the whole defence of the English pale, as the English territories were called, thrown upon them, at the same time that the bad conduct of the governor was the cause of perpetual disorders. The consequence of this was, that the lords avowed their hatred of Fitz-Andelm: the foldiers were mutinous, ill-appointed, and unpaid; and the Irish came in crowds to the governor with perpetual complaints against the old adventurers, which were always decided against the latter: and this decision increased their confidence, without leffening their difaffection.

In this unfavourable thate of affairs, John de Courcey, a bold adventurer, who had as yet reaped none of the benefits he expected, refolved to undertake an expedition against the natives, in order to enrich himfelf with their fpoils. The Irish at that time were giving no offence; and therefore pleaded the treaty lately concluded with King Henry : but treaties were of little avail, when put in competition with the neceffities of an indigent and rapacious adventurer. The confequence was, that the flame of war was kindled through the whole island. The chieftains took advantage of the war with the English, to commence hostilities against each other. Defmond and Thomond, in the fouthern province, were diffracted by the jealousies of contending chiefs, and the whole land was wasted by unnatural and bloody quarrels. Treachery and murder were revenged by practices of the fame kind, in fuch a manner as to perpetuate a fuccession of outrages the most horrid, and the most disgraceful to humanity. The northern province was a scene of the like enormities; though the new English fettlers, who were confidered as a common enemy, ought to have united the natives among themselves. All were equally strangers to the virtues of humanity; nor was religion, in the form it then assumed, capable of restraining these violences in the leaft.

Ireland was thus in a short time reduced to such a He is superflate, that Henry perceived the necessity of recalling feded by Fitz-Andelm, and appointing another governor. He Hugh de was recalled accordingly; and Hugh de Lacey ap. Lacey. pointed to fucceed him. He left his government without being regretted, and is faid by the historians of those times to have done only one good action during the whole course of his administration. This action was nothing more important, than the removing of a relic, called the staff of Jesus, from the cathedral of Armagh to that of Dublin; probably that it might be in greater fafety, as the war raged violently in Ulster. De Lacey, however, was a man of a quite different difposition, and every way qualified for the difficult government with which he was invefted: bnt 32 at the fame time, the king, by invefting his fon John made lord with the lordship of Ireland, gave occasion to greater of Ireland. disturbances than even those which had already happened. The nature of this lordship hath been much disputed; but the most probable opinion is, that the king's fon was now to be invested with all the rights

povern-

ment.

Ireland, who was allowed the title of king of Ireland. It doth not appear, indeed, that Henry had any right to deprive Roderic of these powers, and still less had he to dispose of any of the territories of those chieftains who had agreed to become his tributaries; which nevertheless he certainly did, and which failed not to be productive of an immediate war with these chiefs.

The new governor entered on his office with all that fpirit and vigour which was necessary; but being mifrepresented to the king by some factious barons, he was in a fhort time recalled, and two others, totally unfit for the government, appointed in his room. This error was foon corrected, and Lacey was replaced in three months. The same jealousy which produced his first degradation, soon produced a second; and Philip de Braofa, or Philip of Worcefter, as he is called, a man of a most avaritious disposition, was appointed to succeed him. This governor behaved in such a manner, that his fuperstitious subjects expected every moment that the vengeance of heaven would fall upon him, and deliver them from his tyranny. His power, however, was of short duration ; for now prince John prepared to exercise the authority with which his father had invested him in Ireland. He was attended by a confiderable military force: his train was formed of a company of gallant Normans in the pride of youth; but luxurious, infolent, and followed by a number of Englishmen, strangers to the country they were to vifit, desperate in their fortunes, accustomed to a life of profligacy, and filled with great expectations of advantage from their present service. The whole affembly embarked in a fleet of 60 fhips; and arrived at Waterford after a prosperous voyage, filling the whole country with the greatest furprise and expectation.

The young prince had not yet arrived at the years of discretion; nor indeed, from his subsequent conduct, doth it appear that his disposition was such as qualified him in the least for the high dignity to which he was raifed. The hardy Welchmen who first migrated into Ireland, immediately waited upon him to do him homage; but they were difagreeable to the gay courtiers, and to the prince himself, who minded nothing but his pleasures. The Irish lords were at first terrified by the magnificent representation of the force of the English army; and being reconciled to fubmission by the dignity of the prince's station, hastened in crowds to Waterford to do him homage. They exhibited a spectacle to the Norman courtiers, which the latter did not fail to treat with contempt and ridicule. The Irish lords, with uncouth attire, thick bushy beards, and hair standing on end, advanced with very little ceremony; and, according to their own notions of respect, offered to kifs the young prince. His attendants stepped in, and prevented this horrid violation of decorum by thrusting away the Irishmen. The whole assembly burst into peals of laughter, pulled the beards, and committed feveral other indignities on the persons of their guests; which were immediately and feverely refented. The chieftains left the court, boiling with indignation; and meeting others of their countrymen haltening to do homage to the prince, they informed them of the reception they themselves had met with. A league was inftantly formed to extirpate the English, and the whole nation flew to arms; while John and his cour-

tiers, instead of opposing the enemy, employed them- Irelanda felves in haraffing and oppreffing those who were under their immediate jurisdiction. The country was therefore over-run by the barbarians, agriculture entirely neglected, and a dreadful famine threatened to follow the calamities of war.

This terrible devastation had continued for eight months before the king was fully acquainted with it. He then determined to recal his fon ; but was at a lofs whom he should name for his successor. Lacey had been murdered by an Irish peasant, and the king was at last obliged to have recourse to John de Courcey. whole boilterous valour feemed now to be absolutely necessary to prevent the English from being totally exterminated. The new governor was obliged at first to act on the defensive; but as his enemies foon forgot Suppressed their league, and began their usual hostilities against by John de each other, he was at last enabled to maintain the authority of the English government, and to support their acquifitions in Ireland, though not to extend

In this fituation were the affairs of Ireland when Miferable Henry II. died, and was succeeded by his fon Rich. state of treard I. The new king was determined on an expedition land under to the holy land, which left him no leifure to attend to the affairs of Ireland. John, by wirtue of the powers granted him by his father, took upon him the management of Irish affairs; and immediately degraded de Courcey from his government, appointing in his place Hugh de Lacey the younger. De Courcey, provoked at this indignity, retired into Ulfler, where he was: immediately engaged in a furious war with the natives. and at last almost entirely detached himself from the English government. The greatest confusion ensued; Hugh de Lacey was recalled from his government, and William Petit, earl marshal of England, appointed in his place. Petit's administration proved more unfortunate than that of any of his predeceffors. Confederacies every where took place against the English; the latter were every where defeated, their towns taken ; and their power would certainly have been annihilated. had not the Irish, as usual, turned their arms against

In this desperate situation matters continued during Somewhat the whole reign of king Richard, and part of the reign better unof John, while the diffresses of the country were in-der John. creased by the diffentions and disaffection of the English lords, who aspired at independency, and made war upon each other like Irish chieftains. The prudent conduct of a governor named Meiler Fitz-Henry, however, at last put an end to these terrible commotions; and about the year 1208, the kingdom was more quiet than it had been for a long time before. In 1210, John came over to Ireland in person with an army, with a defign, as he faid, to reduce his refractory nobles to a fense of their duty. More than 20 Irish, chiefs waited upon him immediately to do him homage; while three of the English barons, Hugh and Walter de Lacey and William de Braofa fled to France. The king, at the defire of his Irish subjects, granted them, for their information, a regular code and charter of laws, to be deposited in the exchequer of Dablin, under the king's feal. For the regular and effectual execution of these laws, besides the establishment of the king's courts of judicature in Dublin, there was

Treland, now made a new and more ample division of the kine's deed could it be otherwise; for through the partiali- Ireland. lands of Ireland into counties, where sheriffs, and many other officers, were appointed. Thefe counties were, Dublin, Meath, Kildare, Argial, now called Lownly, Katherlagh, Kilkenny, Wexford, Waterford, Cork, Kerry, Limeric, Tipperary; which marks the extent of the English dominions at this time as confined to a part of Leinster and Munster, and to those parts of Meath and Argial which lie in the province of Ulfter, as now defined. Before his departure, the king gave liberty to John de Grey, bishop of Norwich, whom he appointed governor, to coin money of the fame weight with that of England; and which, by royal proclamation, was made current in England as well as Ireland.

This ecclefiaftical governor is faid to have managed

affairs to happily, that during the violent contests between John and his barons, Ireland enjoyed an unufual degree of tranquillity. We are not to imagine, however, that this unhappy country was at this or indeed any other period, till the end of Oueen Elizabeth's reign, perfectly free from diforders, only they were confined to those diffricts most remote from the English government. In 1219, the commotions were renewed, thro? the immeasurable ambition and contentions of the into its for- English barons, who despised all controul, and oppressed the inhabitants in a terrible manner. The diforders in England during the reign of Henry III. encouraged them to despife the royal authority; they were ever the fecret enemies, and fometimes the avowed adversaries, of each other; and in many places where they had obtained fettlements, the natives were first driven into infurrections by their cruelty, and then punished with double cruelty for their resistance. The English laws, which tended to punish the authors of these outrages, were scorned by an imperious aristocratic faction, who, in the phrenzy of rapine and ambition, trampled on the most falutary institutions. In 1228, a remonstrance was presented to the king against this dangerous neglect and suspension of the laws; which he answered by a mandate to the chief governor, directing that the whole body of nobility, knights, free tenants, and bailiffs of the feveral counties, should be convened; that the charter of English laws and customs received from king John, and to which they were bound by oath, should be read over in their presence; that they should be directed for the future ilricity to observe and adhere to these; and that proclamation should be made in every county of Ireland, strictly enjoining obedience, on pain of forfeiture of lands and tenements. How little effect was produced by this order, we may learn from another, dated in 1246; where the barons are commanded, for the peace and tranquillity of the land, to permit it to be governed by the laws of England.

Execflive Nothing indeed can be conceived more terrible than depravation the state of Ireland during the reign of Henry III. of manners. People of all ranks appear to have been funk in the lowest degree of depravity. The powerful English lords not only subverted the peace and security of the people, by refusing to admit the salutary laws of their own country, but behaved with the utmost injustice and violence to the natives who did not enjoy the benefits of the English constitution. The clergy appear to have been equally abandoned with the reft; nor inties of Henry himfelf, the neglected, the worthless, and the depressed among the English clergy, found refuge in the church of Ireland. What were the manners of these clergy, will appear from the following petition of a widow to king Edward I.

" Margaret le Blunde, of Cathel, petitions our lord the king's grace, that she may have her inheritance which the recovered at Clonmell before the king's judges, &c. against David Macmackerwayt bishop of

Cashel.

" Item, the faid Margaret petitions redrefs on account that her father was killed by the faid bishop.

" Item, for the imprisonment of her grandfather and mother, whom he that up and detained in prifon until they perithed by famine, because they attempted to feek redrefs for the death of their fon, father of your petitioner, who had been killed by the faid bishop.

" Item, for the death of her fix brothers and fifters, who were starved to death by the faid bishop, because he had their inheritance in his hands at the time he

killed their father.

" And it is to be noted, that the faid bishop had built an abbey in the city of Cashel, on the king's lands granted for this purpofe, which he hath filled with robbers, who murder the English, and depopulate the country; and that when the council of our lord the king attempts to take cognizance of the offence, he fulminates the fentence of excommunication against them.

" It is to be noted also, that the faid Margaret has five times croffed the Irish sea. Wherefore, she petitions for God's !fake, that the king's grace will have compassion, and that she may be admitted to take pos-

fession of her inheritance.

" It is further to be noted, that the aforefaid bishop hath been guilty of the death of many other Englishmen befides that of her father; and that the aforefaid Margaret hath many times obtained writs of our lord the king, but to no effect, by reason of the influence and bribery of the faid bishop.

" She further petitions, for God's fake, that she

may have costs and damages, &c."

Matters continued in the same deplorable state during the reign of Edward I. with this additional grie- Little altowvance, that the kingdom was infelted by invalions of ration unthe Scots. The English monarch indeed possessed all der Edthat prudence and valour which were necessary to have reduced the island to a state of tranquillity; but his project of conquering Scotland left him but little leifure to attend to the distracted state of Ireland. Certain it is, however, that the grievous diffress of that country gave him great uneafiness; so that he transmitted his mandate to the prelates of Ireland, requiring them to interpole their fpiritual authority for composing the public diforders. About the same time, the Irish who lay contiguous to the English, and who dwelt among them, prefented a petition to the king, offering to pay him 8000 merks, upon condition that they were admitted to the privileges of English subjects. To this petition he retured a favourable answer; but his good intentions were defeated by the licentious nobility, who knew that these laws would have circumferibed their rapacious views, and controuled their

Relapfes mer flate under Henzy lii.

the Scots

reign of

in the

Ireland. violence and oppression. Petitions of the same kind were feveral times repeated during this reign, but as often defeated; though fome means were used for the peace of the kingdom, fuch as the frequent calling of parliaments, appointing theriffs in fome new counties, &c.

These means were not altogether without effect. They served to give some check to the disorders of the realm, though by no means to terminate or fubdue them. The incursions of the natives were repressed, and the English lords began to live on better terms with each other; and, in 1311, under Edward II. the most powerful of them were reconciled by the marriage of Maurice and Thomas Fitz John, afterwards the heads of the illustrious houses of Desmon and Kildare, to two daughters of the earl of Ulfter. But just at this happy period, when the nation feemed to have fome prospect of tranquillity, more dreadful ca-Invalion of lamities than any hitherto related were about to take place. The Scots had just recovered their liberty under Robert Bruce, and were now in no danger of being Edward II. again enflaved by a foreign power. Edward, the king's brother, as a recompence for his fervices, demanded a share of the royal authority. This was refufed by Robert, and Edward was for the present satisfied by being declared heir apparent to the crown. But the king, wifely confidering the necessity of finding out fome employment for a youth of fuch an aspiring and ambitious disposition, pointed out to his brother the island of Ireland, the conquest of which would be easy, on account of the diffracted flate in which it almost always was, and which would make him an independent fovereign. This propofal was eagerly embraced by Edward, and every thing necessary for the expedition immediately got ready. On the 25th of May 1315, he landed on the north-eaftern coaft of Ireland with 6000 men, to affert his claim to the fovereignty of this kingdom. The Irish lords of Ulster, who had invited and encouraged him to this enterprize, were now prepared to receive their new monarch, flocked with eagerness to his standard, and prepared to wreak their vengeance on the common enemy. Their progress was marked by desolation and carnage. The English settlers were flaughtered, or driven from their poffessions, their castles levelled with the ground, and their towns fet on fire. The English lords were neither prepared to refift the invalion, nor fufficiently united among themselves. The consequence was, that the enemy for fome time met with no interruption. An intolerable fearcity of provisions, however, prevented Bruce from purfuing his advantages; and though his brother landed in Ireland with a powerful army, the famine prevented him from being of any effential tervice. The forces which he left behind him, however, proved of confiderable advantage; and by means of this reinforcement, he was enabled to take the city of Carrickfergus.

The terrible devastations committed by Bruce and his affociates, now induced fome English lords to enter into an affociation to defend their possessions, and repel these invaders. For this purpose, they raised a confederable body of forces; which coming to an engagement with Fedlim prince of Connaught, one of Bruce's principal allies, entirely defeated and killed him with 2000 of his men. This defeat, however, had very

little effect on the operations of Bruce himfelf. He Ireland. ravaged the country to the walls of Dublin, traverfed the diffriet of Offory, and penetrated into Munfter, destroying every thing with fire and fword. The English continued to augment their army, till at last it amounted to 30,000 men; and then Bruce, no longer able to oppose such a force, found it necessary to retire into the province of Ulfter. His retreat was effected with great difficulty; and during the time of his inactivity, the diffresses of his army increased to such a degree, that they are faid to have fed upon the bodies of their dead companions. At last an end was put to the fufferings and the life of this adventurer in the battle of Dundalk, in 1318, where he was defeated 42 and killed by the English under Sir Robert Birming. They are ham. A brave English knight, named Maupas, had feated, rushed forward to encounter Bruce himself, and both antagonists had killed each other; the body of Maupas being found, after the battle, ftretched upon that of Bruce. The king of Scotland had been advancing with powerful fuccours to his brother : but Edward. confident of victory, refused to wait his arrival; and Robert, on hearing of his brother's death, inftantly

The defeat of the Scottish invaders did not put an end to the diffurbances of this unhappy country. The contentions of the English with one another, of the Irish with the English, and among themselves, still kept the island in a state of the utmost barbarity and confusion. An attempt was made indeed, in the reign of Edward II. to establish an university in Dublin; but for want of proper encouragement the institution for some time languished, and then expired amidst the confusion and anarchy of the country. The reign of Edward III. proved not much more favourable than Miferes of preceding times had been. He was too much taken the Lifth up with the idea of conquering France, to pay much under Ed-regard to the interests of Ireland. The unhappy ward III. people, indeed, fensible of their own miferies, petitioned the king to admit all his subjects in Ireland to a participation of the English laws; but the petition being delivered as usual to the chief governor, and laid before the parliament, it was either clandeflinely defeated or openly rejected. A new scene of tumust and bloodshed immediately ensued; which at last produced an order from the king, prohibiting all Irishmen, or Englishmen married and having effates in Ireland, from bearing any public office whatever .-This, instead of having a tendency to promote peace, made the diforders much greater than before; and at last produced a remonstrance from the states met at Kilkenny, in which they grievoufly complain not only of the diforders of the kingdom, but also of the conduct of the king himself in the edict above mentioned : and to this remonstrance the king thought proper to give a gracious and condescending answer, in order to procure from Ireland the succours he wanted in his

expedition against France. It is not to be supposed, that mere promises, unaffifted by any vigorous exertion, could make the least alteration in the state of a kingdom involved in fo much mifery. The diforders, however, at last became insupportable to the inhabitants themselves; and a parliament was fummoned in 1367, the refult of which was the famous statute of Kilkenny. The preamble

Kilkenny.

treland, to this act recites, that the English had become mere Irish in their language, names, apparel, and manner of living; had rejected the English laws, and submitted to those of the Irish, with whom they had united by marriage-alliance, to the ruin of the common wealth. -It was therefore enacted, that marriage, nurture of infants. &c. with the Irifh, should be considered and punished as high treason .- Again, if any man of English race shall use an Irish name, the Irish language, or the Irish apparel, or any mode or custom of the Irish, the act provides, that he shall forfeit lands and tenements, until he hath given fecurity in the court of chancery to conform in every particular to the English manners; or if he have no lands, that he shall he imprisoned till the like fecurity be given. The Brehon law was pronounced to be a pernicious cuftom and innovation lately introduced among the English fubicets; and it was therefore ordained, that in all their controversies they should be governed by the common law of England; and that whoever should fubmit to the Irish jurisdiction, should be adjudged guilty of high treason. As the English had been accustomed to make war or peace with the bordering Irish at pleasure, they were now expressly prohibited from levying war without special warrant from the flate.-It was also made highly penal for the English to permit their Irish neighbours to graze their lands, to prefent them to ecclefiaftical benefices, or to receive them into monasteries or religious houses; to entertain their bards, who perverted their imaginations by romantic tales; or their news tellers, who feduced them by false reports .- It was made felony to impose or cess any forces upon the English subject against his will. And as the royal liberties and frauchifes were become fanctuaries for malefactors, express power was given to the king's sheriffs to enter into all franchifes, and there to apprehend felons and traitors.- Laftly, because the great lords, when they levied forces for the public fervice, acted with partiality, and laid unequal burdens upon the fubjects, it was ordained that four wardens of the peace in every county should adjudge what men and armour every lord or tenant should provide .- The statute was promulged with particular folemnity; and the spiritual lords, the better to enforce obedience, denounced an excommunication on those who should presume to violate it in any inflance.

This statute, it is evident, could not tend to promote the peace of the kingdom. This could only have been done by removing the animofity between the native Irish and English; but so far was the statute of Kilkenny from having any tendency of this kind, that it manifestly tended to increase the hatred between them. During the whole of this reign, therefore, the flate of the Irish government continued to be greatly difordered and embroiled. The English interest gradually declined; and the connections of the king's fubjects with the original inhabitants, occasioned by their vicinity and necessary intercourse, in despite of all legal injunctions, obliged the king to relax the feverity of the statutes of Kilkenny, in cases where they proved impracticable, or oppressive in the execution. The

refinement of mankind. Even foreign merchants could Ireland. not venture into fuch a dangerous country without particular letters of protection from the throne. The perpetual fuccession of new adventurers from England, led by interest or necessity, served only to inflame diffention, inflead of introducing any effential improvement. Lawyers fent from England were notoriously infufficient, if not corrupt; and, as fuch, had frequently been the objects of complaint. The clergy were a mean grovelling race, totally influenced by the crown. Even prelates were commonly made the inferior agents of government in collecting forces, and raising war against the Irish enemy; but were not to be enticed into this service, except by remittances from the exchequer. Attendance in parliament they dreaded as the greatest hardship; and either recurred to mean excuses to avert the penalty of absence, or sued to the king to be exempted by patent from contributing or affenting to those laws by which they were to be governed.

In this deplorable fituation the kingdom continued power of till the time of Henry VII. who laid the foundation the English of the future civilization of the Irish, as he also did of revives unthe English nation. This he effected by enacting some der Henry falutary laws, and appointing faithful and active governors to fee them put in execution. Of thefe governors Sir Edward Poynings contributed more than any other to the tranquillity of the flate. During his administration was enacted the law known by the name of Poyning's Law, and which hath fince been the fubject of much political debate. The purport of it was, That no parliament should be held in that island without first giving notice to the king of England, and ac-law. quainting him with the acts to be passed in that parliament; neither should any act passed, or any parliament held, without the approbation of the king and council, be deemed valid. Thus was the power of the turbulent barons greatly broken; and the governor. not having it in his power to affemble parliaments . when he pleafed, became a person of much less con-fequence. The whole Irish legislation also became dependent on that of England, and hath ever fince continued to be fo.

From this time we may date the revival of the English power in Ireland; which from the Scottish war in the time of Edward II. had gradually declined into a miserable and precarious state of weakness. The authority of the crown, which had at last been defied, infulted, and rejected, even in the English territory, was reftored and confirmed, and the rebellions vigoroufly opposed and suppressed. The seignory of the British crown over the whole body of the Irish, which in former reigns feemed to have been totally forgotten, was now formally claimed and afferted, and fome of the most ferocious chieftains by their marriage connections became the avowed friends of the English power. An ignominious tribute, called the Black Rent, was indeed still paid to some chieftains; but their hostilities were opposed and chastised, and even in their own districts they were made to feel the superiority of English government.

During the reign of Henry VIII. the Irish affairs perpetual hostility, however, in which the different were neglected; and the diforders, which had only parties lived, proved an effectual bar to the introduc- been checked, and never thoroughly eradicated, retion of those arts which contribute to the comfort and turned as usual. They were further promoted by the

All the diforders ended in the reign of queen Elizabeth.

Ireland. innovations in religion which the king introduced, and barrel; beef from 26 s. 8d. to 8l. the carcafe; mut. Ireland. and Irish. The Reformation, however, continued to make fome progrefs, though flowly, during the reign of Edward VI. and even in the reign of queen Mary; for as the perfecution did not reach thither, many Protestants sled to Ireland in order to avoid the queen's cruelty. The machinations of the Spaniards against queen Elizabeth excited the Irish to fresh insurrections. The king of Spain, indeed, not only encouraped the natives in those infurrections, but actually fent over troops to affift them in driving out the English altogether. This they had well nigh effected; but the Spaniards, upon feeing an army of Irish defeated by an handful of their enemies, were so much provoked that they furrendered all the places they had made themselves matters of, and even offered to affilt the English in reducing the rebels; though it was not thought proper to accept of their affiltance. The confequence of this was, that the Irifh, abandoned by these allies, were unable to carry on the war; and the grand rebel O'Neal of Tirowen, or Tirone, after much treachery, evafion, and many pretended submisfions, was at last obliged to submit in good earnest. He fell upon his knees before the deputy, and petitioned for mercy with an air and aspect of distress. He subfcribed his submission in the most ample manner and form. He implored the queen's gracious commiseration; and humbly fued to be restored to his dignity, and the state of a subject, which he had justly forfeited. He utterly renounced the name of O'Neal, which he had affumed on account of the great veneration in which it was held among the Irish. He abjured all foreign power, and all dependency except on the crown of England; refigned all claim to any lands excenting fuch as fhould be conferred upon him by letters patent; promiting at the fame time to affift the flate in abolishing all barbarous customs, and establishing law and civility among his people. The lord deputy, on the part of the queen, promifed a full pardon to him and all his followers; to himself the restoration of his blood and honours, with a new patent for his lands, except fome portions referved for certain chieftains received into favour, and fome for the use of

No infurgent now remained in this kingdom who had not obtained or fued for mercy. Many, indeed, were driven by necessity to the continent, and earned a fubfiltence by ferving in the armies of Spain; and thus a race of Irish exiles was trained to arms, filled with a malignant refentment against the English. Thus the honour of reducing all the enemies of the crown of England in this island, after a continued contest for 440 years, was referved for the arms of Elizabeth. The ghaftliness of famine and desolation was now somewhat enlivened by the restoration of tranquillity. Indeed, from the most authentic accounts, the prices of provisions were so high, that confidering the value of money at that time, it is furprifing how the inhabitants could subfift. From an account of the rates of provisions taken by the mayor of Dublin in 1602, it appears. That wheat had rifen from 36 s. to 9 l. the quarter; barley-malt from 108 to 43 8. the barrel; oat-malt from 5 s. to 22 s. the barrel; peafe from 5.6. to 40s. the peck; oats from 3.s. 4d. to 20s. the without hufbandry or tillage; there they increased to Nº 169.

which were exceedingly difagreeable both to English ton from 3 s. to 26 s. the carcafe; veal from 10 s. to 29 s. the carcase; a lamb from 12 d. to 68.; a pork from 8 s. to 20 s.

Under James I. Ireland began to affume a quite dif. The Irifh ferent appearance. That monarch valued himfelf upon civilized by promoting the arts of peace, and made it his fludy to James L. civilize his barbarous Irish subjects. By repeated conspiracies and rebellions, a vait tract of land had escheated to the crown in fix northern counties, Tyrconnel, now called Donnegal, Tirone, Derry, Farmanagh, Cavan, and Armagh, amounting to about 500,000 acres : a tract of country covered with woods, where rebels and banditti found a secure refuge, and which was deflined to lie waste without the timely interposition of government. James refolved to dispose of these lands in fuch a manner as might introduce all the happy confequences of peace and cultivation. He caused surveys to be taken of the feveral counties where the new fettlements were to be established; described particularly the state of each; pointed out the fituations proper for the erections of towns and cattles: delineated the characters of the Irish chieftains, the manner in which they should be treated, the temper and circumstances of the old inhabitants, the rights of the new purchasers, and the claims of both; together with the impediments to former plantations, and the methods of removing them.

At his instance it was resolved, that the persons to whom lands were affigned should be either new undertakers from Great Britain, especially from Scotland, or fervitors, as they were called; that is, men who had for fome time ferved in Ireland, either in civil or military offices; or old Irish chieftains or captains. Among the last were included even those Irish who liad engaged in the rebellion of Tirone, and still harboured their fecret discontents. To gain them, if possible, by favour and lenity, they were treated with particular indulgence. Their under-tenants and fervants were allowed to be of their own religion; and, while all the other planters were obliged to take the oath of allegiance, they were tacitly excepted. The fervitors were allowed to take their tenants either from Ireland or Britain, provided no Popish recusants were admitted. The British undertakers were confined to their

own countrymen. In the plantations which had been formerly attempted, the Irish and English had been mixed together, from a fond imagination that the one would have learned civility and industry from the other. But experience had now discovered, that this intercourse served only to make the Irish envy the superior comforts of their English neighbours, and to take the advantage of a free access to their houses to steal their goods and plot against their lives. It was therefore deemed neceffary to plant them in separate quarters; and in the choice of these situations, the errors of former times were carefully corrected. The original English adventurers, on their first fettlement in Ireland, were captivated by the fair appearance of the plair and open diffricts. Here they erected their cattles and habitations; and forced the old natives into the woods and mountains, their natural fortreffes. There they kept themselves unknown, living by the milk of their kine.

Exorbitant prices of provisions at that Lime.

English garrisons.

Ireland, incredible numbers by promifcuous generation; and there they held their femblies, and formed their conspiracies, without discovery. But now the northern Irish were placed in the most open and accessible parts of the country, where they might lie under the close inspection of their neighbours, and be gradually habituated to agriculture and the mechanic arts. To the British adventurers were assigned places of the greatest ftrength and command; to the fervitors, flations of the greatest danger, and greatest advantage to the crown: but as this appeared a peculiar hardship, they were allowed guards and entertainment, until the country should be quietly and completely planted.

The experience of ages had shown the inconvenience of enormous grants to particular lords, attended with fuch privileges as obstructed the administration of civil government : and, even in the late reign, favourite undertakers had been gratified with fuch portions of land as they were by no means able to plant. But, by the present scheme, the lands to be planted were divided in three different proportions; the greatest to confist of 2000 English acres, the least of 1000, and the middle of 1500. One half of the escheated lands in each county was affigned to the smallest, the other moiety divided between the other proportions: and the general distributions being thus afcertained, to prevent all disputes between the undertakers, their settlements in the respective districts were to be determined by lot. Estates were assigned to all, to be held of them and their heirs. The undertakers of 2000 acres were to hold of the king in capite; those of 1500, by knights fervice; those of 1000, in common foccage. The first were to build a castle, and inclose a strong court yard, or lawn as it was called, within four years; the fecond, to finish an house and bawn within two years; and the third, to inclose a bawn; for even this rude species of fortification was accounted no inconfiderable defence against an Irish enemy. The first were to plant upon their lands, within three years, 48 able men of English or Scottish birth, to be reduced to 20 families; to keep a demefne of 600 acres in their own hands; to have four fee farmers on 120 acres each; fix leafe holders, each on 100 acres; and on the reft, eight families of husbandmen, artificers, and cottagers. The others were under the like obligations proportionably. All were, for five years after the date of their patents, to refide upon their lands either in person, or by such agents as should be approved by the flate, and to keep a fusficient quantity of arms for their defence. The British and servitors were not to alienate their lands to mere Irish, or to demise any portions of them to fuch persons as should refuse to take the oaths to government; they were to let them at determined rents, and for no shorter term than 21 years or three lives. The houses of their tenants were to be built after the English fashion, and united together in towns or villages. They had power to erect manours, to hold courts-baron, and to create tenures. The old natives, whose tenures were granted in fee-simple, to be held in foccage, were allowed the like privileges. They were enjoined to fet their lands at certain rents, and for the like terms as the other undertakers; to take no lrish exactions from their inferior tenants, and to oblige them to forfake their old Scythian cuftom of Vol. IX. Part I.

flure, or creaghting, as they called it; to dwell in Ireland. towns, and conform to the English manner of tillage and hufbandry. An annual rent from all the lands was referved to the crown for every 60 English acres. fix shillings and eight pence from the undertakers, ten shillings from servitors, and 13 shillings and four pence from Irish natives. But for two years they were exempt from fuch payments, except the natives, who were not subject to the charge of transportation. What gave particular credit to this undertaking, was the capital part which the city of London was perfuaded to take in it. The corporation accepted of large grants in the county of Derry; they engaged to expend L. 20,000 on the plantation, to build the cities of Derry and Colerain, and stipulated for such privileges as might make their fettlements convenient and respectable. As a competent force was necessary to protect this infant plantation, the king, to support the charge, inflituted the order of baronets, an hereditary dignity, to be conferred on a number not exceeding 200; each of whom, on paffing his patent, was to pay into the exchequer fuch a fum as would maintain 30 men in Ulfter, for three years, at 8 d.

daily pay.

But scarcely had the lands been allotted to the different patentees, when confiderable portions were reclaimed by the clergy as their rightful property. And fo far had the effates of the northern bishoprics been embarraffed, both by the usurpations of the Irish lords. and the claims of patentees, that they scarcely afforded a competent, much less an honourable, provision for men of worth and learning, while the flate of the parochial clergy was still more deplorable. Most of the northern churches had been either destroyed in the late wars or had fallen to ruin: the benefices were fmall, and either shamefully kept by the bishops in the way of commendam or fequestration; or filled with ministers as fcandalous as their income. The wretched flock was totally abandoned; and for many years divine fervice had not been used in any parish-church of Ulfter, except in cities and great towns. To remedy these abuses, and to make some proper provision for the instruction of a people immerfed in lamentable ignorance, the king ordained, that all ecclefiaftical lands should be restored to their respective sees and churches. and that all lands should be deemed ecclesiastical from which bishops had in former times received rents or penfions: that compositions should be made with the patentees for the fite of cathedral churches, the refidences of bishops and dignitaries, and other churchlands which were not intended to be conveyed to them: who were to receive equivalents if they compounded freely; or elfe to be deprived of their patents as the king was deceived in his grant, and the pofferfions re-flored to the church. To provide for the inferior clergy, the bishops were obliged to resign all their impropriations, and relinquish the tythes paid them out of parishes, to the respective incumbents; for which ample recompence was made out of the king's lands. Every proportion allotted to undertakers was made a parish, with a parochial church to each. The incumbents, befides their tythes and duties, had glebe-lands affigned to them of 60, 90, or 120 acres, according to the extent of their parifies. To provide for a fuccefwandering with their cattle from place to place for pa- fion of worthy paftors, free-schools were endowed in

miserable occupiers; who are absolutely no better than tain, yet being a distinct dominion, and no part of the

conferred on the university of Dublin, which had been re-ofablished by queen Elizabeth, together with the advowson of fix parochial churches, three of the largest, and three of the middle proportion in each county.

Such was the general scheme of this famous northern plantation. fo honourable to the king, and of fuch consequence to the realm of Ireland. Its happy effects were immediately perceived, although the execution by no means corresponded with the original idea. Buildings were flowly erected; British tenants were difficult to be procured in fufficient numbers : the old natives were at hand, offered higher rents, and were received into those districts from which it was intended to exclude them. In this particular, the Londoners were accused of being notoriously delinquent. They acted entirely by agents; their agents were interested and indolent, and therefore readily countenanced this dangerous intrusion of the natives; an error of which fufficient cause was asterwards found to repent. For the present, however, a number of loyal and induftrious inhabitants was poured into the northern counties, confiderable improvements made by the planters, and many towns erected. To encourage their induftry, and advance his own project, the king was pleafed to incorporate feveral of thefe towns, fo that they had a right of reprefentation in the Irish parlia-

The only disturbance that now enfued was from the

State of Iveland fince that time.

ftant religion established in preserence to their own, while they had power to refift. After numberless ineffectual machinations and complaints, their fury broke out in a terrible maffacre of the new English fettlers in the year 1641*. The affairs of Britain were at that tain, no 103 time in fuch confusion, that the rebellion could not be quelled in lefs than ten years; during which time the country was reduced to a most deplorable fituation. It fion by an attempt made in favour of the exiled mocovered from the miserable fituation to which it was to long reduced. As yet, however, it is far from being in fuch a flourishing flate as either South or North Britain. One great obstacle to the improvement of the kingdom is the extreme poverty and oppression of the common people. The produce of the kingdom, either in corn or cattle, is not above two thirds at most of what by good cultivation it might yield. The high roads throughout the fouthern and western parts are lined with beggars, who live in huts or cabbins without chimnies, or any covering capable of defending the wretched inhabitants from the cold, wind, and rain. " It is a fcandal (fays a judicious traveller, who lately vifited Ireland) to the proprietors of this fertile country, that there is not the greatest plenty of good corn and hay in it; but fome of the best land in

Ireland, the principal towns, and confiderable grants of lands flaves to the despicable, lazy, and oppreffive subordinate landlords."

Another cause consisted in the various restrictions Origin of which it had been thought proper to lay upon the Irish the Irish trade, and the constant and great preference given by discontents. government to the English manufacturers, at last produced the most grievous discontents and distresses. On the the argupart of England it was supposed, that as Ireland had more for been subdued by force of arms, the inhabitants ought and against in every respect to be subject to the victorious state; the Irish. and that the interest of the English ought on all occasions to be consulted, without regarding the inconveniences which might enfue to the Irifh. A very different idea, however, was entertained by the Irish themselves, or at least by the patriotic party among them. They rejected all notions of dependence upon the British ministry and parliament; and though they did not feruple to acknowledge the king's right of conquest, they most positively denied that the British parliament had any authority whatever over them : and therefore looked upon the restrictions laid upon their trade as the most grievous and intolerable oppreffion.

In the year 1719, according to Mr Crawford, the Caufe of oppression and grievances of Ireland became altogether Sherlock insupportable. A cause relative to an estate, betwixt fleyin 1719. Hester Sherlock and Maurice Annesley, was tried be-fore the court of exchequer in Ireland. Here the latter obtained a decree in his favour; but, on an appeal, the fentence was reverfed by the lords. Annefley appealed from them to the English peers; who having reverfed the judgement of those of Ireland, he was put in possession of the subject in dispute. Sherlock appealed again to the Irish lords, and the matter became very ferious. It was proposed to the confideration of the judges, Whether by the laws of the land an appeal lies from a decree of the court of exchequer in Ireland to the king in parliament in Britain. This question being determined in the negative, Sherlock was again recovered again under Cromwell, Charles II. and the put in possession of the estate. A petition was some thort reign of James II. On the accession of Wil- time after presented to the house by Alexander Burliam III. matters were once more thrown into confu- rowes theriff of Kildare, fetting forth, "That his predeceffor in office had put Sherlock in possession of the march, who came over thither in person, and whose premisses; that, upon his entering into office, an injuncbad fuccess is related under the article BRITAIN, tion, agreeable to the order of the English peers, iffued no 200-225. Since that time, Ireland hath re- from the exchequer, requiring him to relice Maurice Annefley to the possession of the above mentioned lands; and that, not daring to act in contradiction to the order of the house, he was fined. In consequence of this, being afraid left he should be taken into custody, he durst not come in to pass his accounts; and for this he was fined L. 1200." His conduct was applauded by the Dispute be-Irish lords, who commanded the fines imposed upon twist the him to be taken off; and in a short time after drew up reland a memorial to be prefented to his majefty. In this and Engthey fet forth, that having submitted to Henry II. as land. their liege lord, they had from him obtained the benefit of English law, with many other privileges, particularly that of having a diffinct parliament. In confequence of this concession, the English had been encouraged to come over and fettle in Ireland, where they were to enjoy the fame privileges as in their own the king's dominions is fuffered to be torn in pieces, country. They farther infilled, that though the imand cultivated in the vilest manner, by a set of abject perial crown of Ireland was annexed to that of Bri-

kingdom

-106.

freland. kingdom of England, none could determine with regard to its affairs, but fuch as were authorised by its known laws and customs, or the express confent of the king. It was an invation of his majefty's prerogative for any court of judicature to take upon them to declare, that he could not by his authority in parliament determine all controversies betwixt his subjects of this kingdom; or that, when they appealed to his majesty in parliament, they did not bring their cause before a competent judicature : and they represented, that the practice of appeals from the Irish parliament to the British peers was an usurped jurisdiction assumed by the latter; the bad consequences of which they pointed out very fully.

This representation being laid before his majefty in parliament, it was refolved, that the barons of exchequer in Ireland had acted with courage and fidelity, according to law, &c. and an address was presented to his majefty, praying him to confer on them some mark of his royal favour as a recompense for the injuries they Bill paffed had fuftained from the Irish legislature. This was folfor the bet-lowed by a bill for the better fecuring the dependency ter fecuring of Ireland upon the crown of Great Britain. By this it was determined, " That the house of lords of Ireland have not, nor of right ought to have, any jurifdiction to judge of, affirm, or reverfe, any judgment,

fentence, or decree, given or made in any court within the kingdom; and that all proceedings before the faid house of lords, upon any such judgment or decree, are utterly null and void to all intents and purposes whatever." It was also determined in this bill, that "the king's majefty, by and with the advice and confent of the lords (piritual and temporal, and commons of Great Britain in parliament affembled, had, hath, and of right ought to have, full power and authority to make laws and flatutes of fufficient force and validity to bind the

people of Ireland."

This bill was looked upon by the Irish to be equivalent to a total annihilation of their liberties; and they were still farther exasperated in the year 1724, by the patent granted to one Wood an Englishman to coin halfpence and farthings for the use of Ireland. In this affair Wood is faid to have acted very dishonourably; infomuch that a shilling of the halfpence he made were fcarcely worth a penny. Great quantities of this base coin were sent over; and it was used not only in change, but accounts were likely to be paid in it, fo that dangerous consequences seemed ready to enfue. The Irish parliament, in an address to the king, represented that they were called upon by their country to lay before his majesty the ill consequences of Wood's patent, and that it was likely to be attended with a diminution of the revenue and the ruin of trade. The same was set forth in an application made to his majesty by the privy council. In short, the whole nation feemed to unite their efforts in order to remedy an evil of fuch dangerous tendency, the effects of which already began to be felt.

Among the controversial pieces which appeared on this occasion, those of Dr Swift were particularly distinguished. His Drapier's letters are to this day held in grateful remembrance by his countrymen; but he was in danger of fuffering deeply in the cause. He Wood had been at particular pains to explain an argument

money, being illegal, could not be forced upon the na- Ireland. tion by the king, without exceeding the limits of his prerogative. Hence the opposite party took occasion to charge the Irish with a design of casting off their dependence on Britain altogether; but Swift having examined the accufation with freedom, pointed out the encroachments made by the British parliament on the liberties of Ircland; and afferted, that any dependence on England, except that of being subjects to the fame king, was contrary to the law of reason, nature, and nations, as well as to the law of the land. This publication was fo difagreeable to government, that they offered a reward of L.300 for the discovery of the author; but as nobody could be found who would give him up, the printer was profecuted in his flead: however, he was unanimously acquitted by a jury of his countrymen.

The Irish continued to be jealous of their liberties, while the British ministry seemed to watch every opportunity of encroaching upon them as far as possible. Apprehensions being entertained of a design upon Ireland by the partifans of the pretender in 1715, a vote of credit to government was passed by the house of 59 commons to a considerable amount. This laid the Dispute foundation of the national debt of that kingdom, which with gowas quickly augmented to feveral hundred thousand about the pounds; for discharge of which a fund had been pro-fund for vided by administration. An attempt was made du- payment of ring the administration of Lord Carteret (who govern the national ed Ireland till 1730), to vest this fund in the hands debt. of his majefty and of his heirs for ever, redeemable by parliament. This was opposed by the patriotic party, who infifted, that it was inconfiftent with the public fafety, and unconflitutional, to grant it longer than from fession to fession. In 1731 another attempt was made to yest the same in the crown for 21 years; but when the affair came to be debated, the strength of both parties was found to be equally balanced. Immediately before the vote, however, Colonel Tottingham having rode post on the occasion, arrived in the house, and determined the question against govern-

The behaviour of Lord Chesterfield, who was made Excellent governor of Ireland in 1745, is highly extolled on ac-conduct of Lord hefcount of his moderation, and the favour he showed to terfield. the liberties of the people. As the apprehensions of government were then very confiderable, on account of the rebellion which raged in Scotland, his lordship was advised to augment the military force of Ireland by 4000 men. Instead of this, however, he fent four battalions to the duke of Cumberland, and encouraged the volunteer affociations which formed in different parts for the defence of their country. These battalions he replaced by additional companies to the regiments already on the eftablishment; by which means he faved a confiderable expence to the nation, without augmenting the influence of the crown. The fupplies asked by him were small, and raised in the most easy and agreeable manner to the people, expending the money at the fame time with the utmost economy. There was even a faving, which he applied to the use of the public. It had been a custom with many of the lieutenant governors of Ireland to beltow reversionary grants, in order to purchase the assistance of friends in used by the Irish on this occasion, viz. that brass support of their measures. Lord Chesterfield, how-

Ireland. ever, being convinced that this practice was prejudicial to the interest of the nation, put a stop to it; but the most remarkable part of his administration was, the humanity with which he treated the Roman Ca-His huma- tholics. Before his arrival, the Romish chapels in nity to the Dublin had been shut up; their priests were command-Roman Ca-ed by proclamation to leave the kingdom; and fuch as disobeved had been subjected to imprisonment and other penalties. Lord Chesterfield, however, convinced that the affection is to be engaged by gentle usage, permitted them to exercise their religion without disturbance. The accufations brought against them of forming plots against government, were difregarded; and fo much was his moderation and uprightness in this respect applauded by all parties, that, during the whole time of his administration, the national tranquillity was not once interrupted by the fmallest internal commotion. On his leaving the island, his buft was placed at the public expence in the castle of

> Lord Chesterfield having left Ireland in the spring of 1746, the island continued to be governed by lords justices until the 13th of September, when William earl of Harrington came over with the powers of lord lieutenant. A contest in the election of representatives for the city of Dublin this year called forth the abilities of Mr Charles Lucas, fo much celebrated for his patriotic virtues. Having fome years before been admitted a member of the common council, he refolved to exert himself in behalf of the privileges of his fellow-citizens. The powers of this city-corporation, as well as of others, had been changed by authority derived from an act in the time of Charles II. and among other innovations, for the purpole of augmenting the influence of the crown, they deprived the commons of the power of choofing the city magistrates. This was now vested in the board of aldermen; which being subject in the exercise of its jurisdiction to the approbation of the privy council, was confequently dependent on government. Mr Lucas complained loudly of the injury; but as this law could not be altered, he fet himfelf to inquire, whether encroachments, which could not be justified by law, had not been made on the rights of the citizens? Having fatisfied himfelf, by fearching diligently into ancient records, that his apprehensions were well-founded, he published his discoveries, explained the nature of the evidence refulting from them, and encouraged the people to take the proper steps for obtaining redrefs.

> The consequence of this was a contest between the commons and aldermen, which lasted two years. The former struggled in vain to recover their lost privileges; but the exertions of Lucas in every stage of the difpute had rendered him to respectable among his countrymen, that on the death of Sir James Somerville he was encouraged to declare himfelf a candidate for a feat in parliament. This being highly agreeable to his wifnes, he was elected accordingly; and difting wifned himfelf not only by the boldness and energy of his speeches, but more especially by a number of addresses to his countrymen. In some of these he particularly confidered the feveral branches of the constitution, and pointed out the encroachments of the British legislature. Government, alarmed at his boldness, determiaed to crush him by the hand of power; for which

reason the most obnoxious paragraphs were extracted Ireland. from his works, and made the foundation of a charge before parliament. The commons voted him an enemy to his country; and addressed the lord lieutenant for an order to profecute him by the attorney-general. The univerfal elteem in which he was held could not fcreen him from ministerial vengeance: he was driven from Ireland; but having fpent fome years in banishment, he was once more enabled, through the exertions of his friends, to prefent himfelf as a candidate for the city of Dublin. Being again elected, he continued to diftinguish himself by the same virtuous principles for which he had been from the beginning fo remarkable, and died with the character which he had preferved through life, of the incorruptible Lucas.

In the year 1753, a remarkable contest took place Dispute

betwixt government and the Irish parliament relative with goto previous confent. As the taxes for defraying state concerning expences are imposed by the representatives of the previous people, it thence naturally follows, that they have a confent. right to superintend the expenditure of them; and by an infpection of the journals of the house of commons, it appeared, that from the year 1692 they had exercifed a right of calling for and examining the public accounts. When any furplus remained in the treasury, it was also customary to dispose of it by bill for the good of the public. In the year 1749, however, a confiderable fum having remained in the treasury, the disposal of this money in future became an object to ministry. In 1751, it was intimated to parliament by the lord lieutenant, the duke of Dorfet, that his majesty would graciously consent and recommend it to them, that fuch part of the money as then remained in the treasury should be applied to the reduction of the national debt." As this implied a right inherent in his majesty to dispose of the money as he thought proper, the propofal was accounted an invation of the privileges of the house of commons. No notice was therefore taken of the direction given by Dorfet, but the bill was fent over to England as usual without any notice taken of his majefty's confent. In England, however, this very material alteration was made, and the word confent introduced into it. The commons at this time did not take any notice of fuch an effential alteration; but next year, on its being repeated, the bill was rejected. Government were now at the utmost pains to defend the measure they had adopted, and pamphlets were published in which it was justified on various grounds. The event at last, however, was, that his majefty by letter took the money which had been the subject of dispute out of the treasury.

In the year 1760 Ireland fultained an inconfiderable invalion by hostile invasion, the first that had been experienced in Thurot in the kingdom for 70 years. The armament confifted 1760. originally of five thips; one of 48 guns, two of 36, and two of 24; having on board 1270 land forces. They were commanded by the celebrated Thurst, whole reputation, as captain of a privateer, had advanced him to this dignity. The fquadron, however, was driven by adverse winds to Gottenburgh; where having continued a few days, they fet fail for the place of their destination. On their arrival at the coast of Ireland, they were obliged to shelter themselves in Lough Foyle from a violent storm which again overtook them. The wind, however, having shifted, and continuing to

Dublin.

treland. blow tempeffuously, they were obliged to keep out to

rest by the violence of the storm, and returned to France; but the remaining three directed their course to the ifland of Ilay, where they anchored; and having repaired their damages, took in a supply of provisions,

and thence failed to Carrickfergus.

In the mean time, an officer belonging to the small number of troops at that time in Carrickfergus took post on a rifing ground, with an advanced party, to observe the motions of the enemy. A skirmish enfued betwixt this party and Thurot's men. until the former, having expended all their ammunition, were obliged to retire into the town. Having in vain attempted to prevent the enemy from taking possession of it, the British troops shut themselves up in the caftle, where they were foon obliged to capitulate, after having killed about 100 of their enemies, with the lofs of only three on their own part. The French having plundered the town, fet fail on the 26th of February; and three days after were all taken by Captain Elliot. Thurot himself being killed in the engagement.

Soon after the accession of George III. Ireland first

began to be diffurbed by a banditti who flyled themfelves White Boys : and as these were generally of the Romish perfuasion, the prejudices against that fect broke forth in the usual manner. A plot was alleged to have been formed against government; French and Spanish emissaries to have been sent over to Ireland, and actually to be employed to affift in carrying it into execution. The real cause of this commotion, however, was as follows: About the year 1739 the murrain broke out among the horned cattle in the duchy of Holstein, from whence it soon after spread through the other parts of Germany. From Germany it reached Holland, from whence it was carried over to England, where it raged with great violence for a number of years. The mitigation of the penal laws against the Papifts about this time encouraged the natives of the fouth of Ireland to turn their thoughts towards agriculture, and the poor began to enjoy the necessaries of life in a comfortable manner. A foreign demand for beef and butter, however, having become uncommonly great, by reason of the cattle distemper just mentioned, ground appropriated to grazing became more valuable than that employed in tillage. The cotters were every where dispossessed of their little poffessions, which the landlords let to monopolizers who could afford a higher rent. Whole baronies were now laid open to pasturage, while the former inhabitants were driven desperate by want of sublistence. Numbers of them fled to the large cities, or emigrated to foreign countries, while those who remained took fmall spots of land, about an acre each, at an exorbitant price, where they endeavoured if possible to procure the means of protracting a miferable existence for themselves and families. For some time these poor creatures were allowed by the more humane landlords the liberty of commonage; but afterwards this was taken away, in despite of justice and a positive agree-

and the low price of labour, not exceeding the wages in the days of Queen Elizabeth, aggravated the di-Aresses of the unhappy sufferers beyond measurc. In such a fituation, it is no wonder that illegal me-

ment; at the fame time, the payment of tythes,

thods were purfued in expectation of redrefs. The Ireland, fea. Two of the ships were thus separated from the people, covered with white skirts, assembled in parties at night, turned up the ground, destroyed bullocks, levelled the inclosures of the commons, and committed other acts of violence. These unavailing efforts were conftrued into a plot against the government; numbers of the rioters were apprehended in the counties of Limerick, Cork, and Tipperary, and some of them condemned and executed. In different places these unhappy wretches, instead of being looked upon as objects of compassion, were prosecuted with the utmost feverity. Judge Afton, however, who was fent over to try them, executed his office with fuch humanity as did him the highest honour. A most extraordinary and affecting instance of this was, that on his return from Dublin, for above ten miles from Clonmell, both fides of the road were lined with men, women, and children; who, as he paffed along, kneeled down and implored the bleffing of heaven upon him as their guardian and protector.

In the mean time, the violences of the White Boys continued, notwithstanding that many examples were made. The idea of rebellion was still kept up; and, without the fmallest foundation, gentlemen of the first rank were publicly charged with being concerned in it, infomuch that fome of them were obliged to enter bail, in order to protect themselves from injury. The Catholics of Waterford gave in a petition to Lord Hertford, the governor in 1765, in behalf of themfelves and brethren, protesting their loyalty and obedience to government; but no effectual ften was taken either to remove or even to investigate the cause of the

diffurbances.

About two years after the appearance of the White Of the Oaks Boys, a fimilar commotion arose in Ulster; which, Boys, however, proceeded in part from a different cause, and was of much shorter duration. By an act of parliament, the making and repairing of highways in Ireland was formerly a grievous oppression on the lower ranks of people. An housekeeper who had no horfe was obliged to work at them fix days in the year; and if he had a horse, the labour of both was required for the fame fpace of time. Besides this oppression, the poor complained that they were frequently obliged to work at roads made for the convenience of individuals. and which were of no fervice to the public. Nor were thefe the only grievances of which the infurgents at this time complained: the tythes exacted by the clergy were faid to be unreasonable, and the rent of lands was more than they could bear. In 1763, therefore, being exasperated by a road proposed to be made thro a part of the county of Armagh, the inhabitants molt immediately affected by it rose in a body, and declared that they would make no more highways of the kind. As a mark of distinction, they wore oakbranches in their hats, from which circumstance they called themselves Oak-boys. The number of their partizans foon increafed, and the infurrection became general through the counties of Armagh, Tyrone, Derry, and Fermanagh. In a few weeks, however, they were dispersed by parties of the military; and the public tranquillity was reftored with the loss of only two or three lives. The road-act, which had been fo justly found fault with, was repealed next fession; and it was determined, that for the future the roads should tie.

Rife of the White Boys.

Ireland. be made and repaired by a tax to be equally affeffed on the lands of the rich and poor.

Boys.

Befides these, another fet of insurgents called Steel-Of the Steel bors foon made their appearance, on the following account. The estate of an absentee nobleman happening to be out of leafe, he proposed, instead of an additional rent, to take fines from his tenants. Many of those, who at that time possessed his lands, were unable to comply with his terms; while others who could afford to do fo, infifted upon a greater rent from the immediate tenants than they were able to pay. The usual confequences of this kind of oppression inflantly took place. Numbers being dispossessed and thrown deflitute, were forced into acts of outrage fimilar to those already mentioned. One of these charged with felony was carried to Belfast, in order to be committed to the county gaol; but his affociates, provoked by the ufage they had received, determined to relieve him. The defign was eagerly entered into by great numbers all over the country; and feveral thousands, having provided themselves with offensive weapons, proceeded to Belfast in order to rescue the prisoners. To prevent this, he was removed to the barracks and put under the guard of a party of foldiers quartered there; but the Steel-boys pressed forward with a determination to accomplish their purpose by force, and some shots were actually exchanged between them and the foldiers. The confequences would undoubtedly have been fatal, had it not been for a physician of highly respectable character, who interposed at the risk of his life, and prevailed on those concerned to fet the prifoner at liberty. The tumult, however, was not thus quelled. The number of infurgents daily increased, and the violences committed by them were much greater than those of the other two parties. Some were taken and tried at Carrickfergus, but none condemned. It was supposed that the fear of popular resentment had influenced the judges; for which reason an act was passed, enjoining the trial of such prisoners for the future to be held in counties different from those where the crimes were committed. This breach of a fundamental law of the conflitution gave fuch offence, that though feveral of the Steel-boys were afterwards taken up and carried to the castle of Dublin, no jury would find them guilty. This obnoxious law was therefore repealed; after which some of the infurgents, being tried in their respective counties, were condemned and executed. Thus the commotions were extinguished: but as no methods were taken to remove the cause, the continued diffresses of the people drove many thousands of them into America in a very

few years. Parliament In the mean time a very material alteration had taken place, in the conflitution of the kingdom, with regard to the duration of parliaments. At an early period these had continued only for a year; but afterwards they were prolonged until the death of a fovereign, unless he chose to dissolve it sooner by an exertion of his prerogative. Thus, from the moment of their election, the commoners of Ireland were in a manner totally independent of the people and under the influence of the crown; and government foon availed itself of this power to bribe a majority to serve its own purpofes. Various methods were thought of to remedy this evil; but all proved ineffectual until the

year 1768, when, during the administration of Lord Ireland. Townshend, a bill was prepared and fent over to England, by which it was enacted, that the Irish parliaments thenceforth flould be held every feven years, It was returned with the addition of one year: and ever fince the parliaments of this country have been octennial. During this fession an attempt was made by the British ministry to infringe the rights of the house of commons in a very material point. A money- An English bill, which had not originated in Ireland, was fent money-bill over from Britain, but was rejected in a spirited man-rejected. ver. Its rejection gave great offence to the Lord Lieutenant, who repeatedly prorogued them till the

year 1771. The affairs of Ireland began now to draw towards that crifis which effected the late remarkable revolution in favour of the liberties of the people. The paffing of the octennial bill had diminished, but not taken away, the influence of the crown; and the fituation of affairs between Britain and America had inclined ministry to make the most of this influence they could. In 1773 Lord Harcourt, at that time governor of Ireland, exerted himself fo powerfully in favour of administration, that the voice of opposition in parliaadministration, that the voice of opposition in pariament was almost entirely filenced. The difficulties, 70 however, under which the whole nation laboured, began in order to be for feverely felt, that an address on the subject flar of ira-land laid was prefented by the commons to his excellency. In before the this they told him, that they hoped he would lay before lord lieutethe king the flate of Ireland, restricted in its com- nant. merce from the short-sighted policy of former times, to the great injury of the kingdom, and the advantage of the rivals, if not of the enemies, of Great Britain. These hardships, they said, were not only impolitic. but unjust; and they told his excellency plainly, that they expected to be restored to some, if not to all their rights, which alone could justify them to their conflituents for laying upon them fo many burdens during the course of this fession.

This reprefentation to the Lord Lieutenant produced no effect; and Ireland for some years longer continued to groan under the burden of intolerable reftrictions. These had principally taken place in the reign of Charles II. At this time it was enacted, that Account of beef or live cattle should not be exported to England; the rettricneither were the commodities of Ireland to be ex-tion on the trifla ported to the American colonies, nor American trade. goods to be imported to any port in Ireland without first unloading them in some part of England or Wales. All trade with Asia was excluded by charters granted to particular companies; and restrictions were imposed upon almost every valuable article of commerce fent to the different ports of Europe. Towards the end of King William's reign an absolute prohibition was laid on the exportation of Irish wool. This refiriction proved difadvantageous not only to Ireland. but to Great Britain herfelf. The French were now plentifully supplied by smuggling with Irish wool; and not only enabled to furnish woollen stuffs sufficient for their own confumpt, but even to vie with the British in foreign markets. Other reftrictions conspired to augment the national calamity; but that which was most fenfibly felt took place in 1776. "There had hitherto (fays Mr Crawford) been exported annually to

America large quantities of Iresh linens: this very

of Ireland made oc sennial.

68

Ireland. confiderable fource of national advantage was now thut up, under pretence of rendering it more difficult for the enemy to be fupplied with the means of fubfiftence; but in reality, to enable a few rapacious English contractors to fultil their engagements, an embargo, which continued, was in 1776 laid upon the exportation of provisions from Ireland, by an unconstitutional stretch of prerogative. Remittances to England, on various accounts, particularly for the payment of our forces abroad, were more than usually confiderable. These immediate causes being combined with those which were invariable and permanent, produced in this country very calamitous effects. Black cattle fell very confiderably in their value: notwithstanding that customers could not be had, The price of wool was reduced in a still greater proportion. Rents every where fell ; nor, in many places, was it possible to collect them. An universal stagnation of bufiness enfued. Credit was very materially injured. Farmers were pressed by extreme necessity, and many of them failed. Numbers of manufacturers were reduced to extreme necessity, and would have perished, bad they not been supported by public charity. Those of every rank and condition were deeply affected by the calamity of the times. Had the flate of the exchequer permitted, grants might have been made to promote industry, and to alleviate the national diffrefs; but it was exhaufted to a very uncommon degree. Almost every branch of the revenue had failed. From want of money the militia law could not be carried into execution. We could not pay our forces abroad; and, to enable us to pay those at home, there was a necessity for borrowing 50.000 l. from England. The money which parliament was forced to raife, it was obliged to borrow at an exorbitant interest. England, in its present state, was affected with the wretched condition to which our affairs were reduced. Individuals there, who had estates in Ireland. were sharers of the common calamity; and the attention of individuals in the British parliament was turned to our fituation, who had even no perfonal interest in this country."

72 Trifh affairs taken into confideraliament.

While things were in this deplorable fituation, earl Nugent, in the year 1778, undertook the cause of the Irish, by moving in parliament, that their affairs should British par- be taken into consideration by a committee of the whole house. This motion being agreed to almost unanimously, it was followed by several others, viz. That the Irish might be permitted to export directly to the British plantations, or to the fettlements on the coast of Africa, all goods being the produce and manufacture of the kingdom, excepting only wool, or woollen manufactures, &c. That all goods, being the produce of any of the British plantations, or of the fettlements on the coast of Africa, tobacco excepted, be allowed to be imported directly from Ireland to all places, Britain excepted. That cotton yarn, the manufacture of Ireland, be allowed to be imported into Great Britain. That glass manufactured in Ireland be permitted to be exported to all places, Brittin excepted .- With respect to the Irish fail cloth and cordage, it was moved, that they should have the same privilege as for the cotton yarn.

These motions having passed unanimously, bills for the relief of Ireland were framed upon them accordingly. The trading and manufacturing towns of Eng. Ireland. land, however, now took the alarm, and petitions against the Irish indulgence were brought forward from many different quarters, and members instructed to oppose it. In consequence of this a warm contest took place on the fecond reading of the bills. Mr Burke fupported them with all the strength of his eloquence : and as the minister seemed to favour them, they were committed; though the violent opposition to them ftill continued, which induced many of their friends at that time to defert their caufe.

Though the efforts of those who favoured the cause New agof Ireland thus proved unfuccessful for the present, tempt in they renewed their endeavours before the Christmas favour of vacation. They now urged, that, independent of all claims from justice and humani y, the relief of Ireland was enforced by necessity. The trade with British America was now loft for ever; and it was indifpenfably requifite to unite the remaining parts of the empire in one common interest and affection. Ireland had hitherto been paffive; but there was danger that, by driving her to extremities, she would cast off the voke altogether; or, even if this should not happen, the tyranny of Britain would be of little advantage; as, on the event of a peace, the people would defert a country in . which they had experienced fuch oppression, and emigrate to America, where they had a greater prospect of liberty. On the other hand, they infifted, that very confiderable advantages must ensue to Britain by the emancipation of Ireland; and every benefit extended to that country would be returned with accumulated . interest. The bufinefs was at last fummed up in a motion made by lord Newhaven, in February 1779, that liberty should be granted to the Irish to import sugars from the West Indies. This was carried; but the New pemerchants of Glasgow and Manchester having peti-titions tioned against it, it was again lost through the interfer against them. rence of the minister, who now exerted his influence against the relief he had formerly declared in favour of-Various other efforts, however, were made to effect the intended purpose; but nothing more could be obtained than a kind of compromise, by which lord Gower pledged himself, as far as he could answer for the conduct of others, that, during the recess, fome plan should be fallen upon for accommodating the affairs of Ireland to the fatisfaction of all par-

In the mean time the affairs of this country haftened to a criss; which forced the British ministry to give that relief fo long folicited, and which they fo often promifed without any intention of performing their promifes. As long as the affairs of the country were An univerunder confideration of the British parliament, the in-salferment : habitants preserved some degree of patience; but, ensues when they found themselves deserted by the minister, the kingtheir difcontent was inflamed beyond measure. The dom. laws he had passed in their favour, viz. an allowance to plant tobacco, and a bill for encouraging the growth of hemp, were confidered as mockery inflead of relief. and it was now refolved to take fuch measures as should effectually convince the ministry that it was not their 79 interest to tyrannize any longer. With this view, affor Affordaciations against the importation of British commodities, ed against which had been entered into in fome places before, now importing became univerfal throughout the kingdom; and fuch British comas modities.

Petitions again the proposed relief.

Rife of the

respect, had the mortification to find themselves exposed to public obloquy and contempt on that ac-count. Thus the Irish manufactures began to revive; and the people of Britain found themselves obliged ferioufly to take into confideration the relief of that country, and to look upon it as a matter very necessary to their own interest. To this also they were still more feriously disposed by the military affociations, military af- which had taken place fome time before, and now fociations affumed a most formidable appearance. These at first in Ireland. were formed by accidental causes. The situation of Britain, for fome time, had not admitted of any effectual method being taken for the defence of Ireland. Its coasts had been insulted, and the trading ships taken by the French and American privateers; nor was it at all improbable that an invalion might foon follow. " The minister (fays Mr Crawford) told us, that the fituation of Britain was fuch as rendered her incapable of protecting us. The weakness of government, from the following circumftance, was firikingly obvious. The mayor of Belfast having transmitted a memorial to the Lord Licutenant, fetting forth the unprotected flate of the coast, and requesting a body of the military for its defence, received for answer, that he could not afford him any other affiftance than half a troop of difmounted horse and half a company of invalids." In this dilemma, a number of the inhabitants of the town affociated for the purpose of felf-defence; and, on the fame principle, a few volunteer companies were formed in different parts of the kingdom. These chose their own officers, purchased their own uniforms and arms, and, with the affiltance of perfons properly qualified, affembled regularly on the parade to acquire a knowledge in the military art. Their respectable appearance, and the zeal they showed in the service of their country, foon excited curiofity and attracted respect. Their number increased every day; and people of the first consequence became ambitious of being enrolled among them. As no foreign enemy appeared, against whom they might exercise their military prowess, these patriotic bands foon began to turn their thoughts towards a deliverance from domestic oppression. No fooner was this idea made known, than it gave new vigour to the spirit of volunteering; infomuch that, tyranny of by the end of 1778, the military affociations were thought to amount at least to 30,000 men. But, while thus formidable from their numbers, and openly avowing their intention to demand a reflitution of their rights from the British ministry, they professed the utmost loyalty and affection to the king; and with regard to fobriety and decent demeanour, they were not only unexceptionable, but exemplary. Instead of exciting diforders themselves, they reftrained every kind of irregularity, and exerted themselves with unanimity and vigour for the execution of the laws.

That fuch a body of armed men, acting without any command or support from government, should be an object of apprehension to ministry, is not to be wondered at. In the infancy of their affociations indeed they might have been suppressed; but matters had been fuffered to proceed too far; and, as they flood at prefent, all refiftance was vain. As the volunteers could them under the influence of the crown; but this being Nº 169.

brelard. as prefumed to oppose the voice of the people in this found impossible, ministry thought proper to treat them Ireland. with an appearance of confidence; and; accordingly, orders were iffued for fupplying them with 16,000 They are stand of arms.

The Irish parliament, thus encouraged by the spirit with arms of the nation, and preffed by the difficulties arifing by the mifrom the diminished value of their estates, resolved to mistry. exert themselves in a becoming manner, in order to The parprocure relief to their country. At their meeting in liament ad-October 1779, an address to his Majesty was drawn dress the up; in which it was expressly declared, that "it was reliefnot by temporary expedients, but by a free trade alone.

that Ireland was now to be faved from impending ruin." When this address was carried up to the Lord Lieutenant, the streets of Dublin were lined with volunteers, commanded by the duke of Leinster, in their arms and uniform. But, though a general expectation of relief was now diffused, an anxious fear of disappointment still continued. If the usual supply was granted for two years, there was danger of the diffresses continuing for all that time; and after it was granted, the prorogation of parliament might put a stop to the expected relief altogether. The people, however, were not now to be trifled with. As the court party showed an aversion to comply with the popular measures, a mob rose in Dublin, who, among Riot in other acts of violence, pulled down the house of the Dubling attorney-general, and did their utmost to compel the members to promife their countenance to the matter in hand. When the point therefore came to be debated, some espoused the popular side from principle, others from necessity; so that on the whole a majority appeared in favour of it. A short money bill was paffed and transmitted to England; where, though very mortifying to the minister, it passed also.

On the meeting of the British parliament in Decem- Affairs of ber, the affairs of Ireland were first taken into conside- Ireland aration in the house of peers. The necessity of granting gain constrelief to that kingdom was firongly fet forth by the the British lord who introduced them. He faid, the Irish, now parliaments confcious of possessing a force and consequence to which they had hitherto been strangers, had resolved to apply it to obtain the advantages of which the nation, by this spirited exertion, now showed themselves worthy. Had they for some time before been gratified in leffer matters, they would now have received with gratitude, what they would, as affairs flood at prefent, confider only as a matter of right. He then moved for a vote of censure on his Majetty's ministers for their neglect of Ireland. This motion was rejected; but Earl Gower, who had now deferted the cause of ministry, declared, that there did not exist in his mind a fingle doubt that the vote of cenfure was not well founded. He added, in his own vindication, that early in the fummer he had promifed that relief should be granted to Ireland, and had done every thing in his power to keep his word; but that all his efforts

had proved fruitless. In the house of commons the minister found himfelf fo hard preffed by the arguments of the minority, and the short money-bill from Ireland, that he was obliged to declare, that in less than a week he intended to move for a committee of the whole house to take the not be controlled, fome attempts were made to bring affairs of Ireland into confideration. On the 13th of December he accordingly brought forward his pro-

politions

81 They refolve to deliver their from the Britain.

positions in favour of this kingdom. The design of twixt England and Ireland, he observed, that, as a Ireland. thele was to repeal the laws prohibiting the exporta-Lord North's to repeal as much of the act of 19th Geo. II. as propropolitions hibited the importation of glass into Ireland, except of in favour of British manufacture, or the exportation of glass from the king-Ireland; and to permit the Irish to export and import dom. commodities to and from the West Indies and the British settlements on the coast of Africa, subject to fuch refolutions and reftrictions as should be imposed

by the Irish parliament.

On these propositions his lordship made several remarks by way of explanation. One object of them, upon them, he faid, was to restore to Ireland the wool export and woollen manufacture. In 1692, from jealoufy or fome other motive, an address had been presented by the English parliament, recommending a kind of compact between the two kingdoms; the terms of which were, that England should enjoy the woollen manufacture, and Ireland the linen, exclusively. But notwithflanding this agreement, it was certain, that England carried on the linen manufacture to as great extent as Ireland, while at the fame time the former retained the monopoly of woollens. The first step taken, in confequence of this agreement, was to lay a heavy duty; equal to a prohibition, upon all wool and woollens exported; and when this act, which was but a temporary one by way of experiment, expired, the English parliament passed a similar one, and made it perpetual; by means of which and fome others a total end was put to the woollen trade of Ireland.

With regard to the trade of Ireland, his lordship observed, that, upon an average of the fix years from 1766 to 1772, the export to Ireland was fomewhat more than two millions; and, in the fucceeding fix years, from 1772 to 1778, about as much more; nearly one half being British manufacture and produce; the other half certified articles, of which this country was the medium of conveyance. The native produce, on an average, was fomewhat more than 900,000l. but of this only 200,000 l. were woollens. The woollen manufacture of Ireland therefore would long continue in a flate of infancy; and though cloths had been manufactured sufficient for home confumption, yet it could hardly be expected that Ireland would rival Great Britain at the foreign markets, when, after the expence of land-carriage, freight, infurance, and factorage, the latter was able to underfell Ireland in her own market on the very fpot, even though aided by the low wages and taxes paid in the country.

With regard to the linen, his lordship observed, that however prosperous it might appear, yet still it was capable of great improvement. The idea of extending and improving the linen-manufacture of Ireland originated from a pamphlet written by Sir William Temple; and this gave rife to the compact which had been referred to. But though this compact was now about to be diffolved, it was his opinion that the bounties on importing Irish linens ought not to be discontinued; because it appeared, that the British bounties had operated as a great encouragement to the Irish manufactures, at the same time that the sum appropriated to this purpose amounted to more than

more liberal spirit had now appeared on both sides of tion of Irish manufactures made of wool or wool flocks; the water, he hoped both kingdoms would be perfectly contented. Ireland would never be able to rival England in the fine woollen fabrics; but allowing the Irish to manufacture their own wool, would put an end to the contraband trade with France; and it ought to be remembered, that whatever was an advantage to Ireland, must, fooner or later, be of fingular advantage to Great Britain, and by the proposed regulations in their commercial connections, the two kingdoms would be put more upon an equality.

With regard to the glass manufacture, his lordship likewife observed, that Ireland had been very injurioully treated. Before the act of 19th Geo. II. they had begun to make some progress in the lower branches of the glass manufacture; but by that act they were not only prevented from importing any other glass than what was of British manufacture, but also from exporting their own glafs, or putting it on a horse or carriage with a defign to be exported. This act had been complained of in Ireland as a great piece of injustice, and it was the intention of his proposition to remove that

grievance.

With regard to the third proposition, his lordship observed, that allowing Ireland a free trade to the colonies must be considered as a favour to that kingdom. Confidering her even as an independent state. fhe could fet up no claim to an intercourfe with the British colonies. By every principle of justice, of the laws of nations, and the cultom of the other European powers who had fettlements and distant dependencies, the mother country had an exclusive right to trade with, and to forbid all others from having any intercourse with them. Were not this the case, what nation under the fun would fpend their blood and treasure in establishing a colony, and protecting and defending it in its infant state, if other nations were afterwards to reap the advantages derived from their labour, hazard, and expence. But though Great Britain had a right to reftrain Ireland from trading with her colonies, his lordship declared himself of opinion that it would be proper to allow her to participate of the trade. This would be the only prudent means of affording her relief; it would be an unequivocal proof of the candoar and fincerity of Great Britain; and he had not the least doubt but it would be received as fuch in Ireland, Britain, however, ought not to be a fufferer by her bounty to Ireland; but this would be the case, should the colony trade be thrown open to the latter, without accompanying it with restrictions similar to those which were laid upon the British trade with them. An equal trade must include an equal share of duties and taxes; and this was the only proper ground on which the benefits expected by the Irish nation could be either granted or defired.

Having made fome other observations on the propriety of these measures, they were regularly formed They are into motions, and paffed unanimously. In Ireland received they were received with the utmost joy and gratitude with great by both houses of parliament. On the 20th of De. joy by the cember the following resolutions were passed; viz. Irish. That the exportation of woollen and other manufactures from retains to an occupant to the diffolution of the compact better tend to relieve its distresses, increase its wealth, promote U u its

Britain, and the common ftrength, wealth, and commerce of the British empire; that a liberty to trade with the British colonies in America and the West Indies, and the fettlements on the coast of Africa, will be productive of very great commercial benefits; will he a most affectionate mark of the regard and attention of Great Britain to the diffresses of the kingdom; and will give new vigour to the zeal of his Majesty's brave and loyal people of Ireland to ftand forth in support of his Majesty's person and government, and the intereft, the honour, and dignity of the British empire." The fame refolutions were, next day, passed in the house of peers.

The highest encomiums were now passed on Lord

North. His exertions in favour of Ireland were de-

clared to have been great and noble; he was thyled

Excessive eulogiums en Lord North to the difadvantage of the mi-

" the great advocate of Ireland;" and it was foretold, that he would be of glorious and immortal memory in that kingdom. But while these panegyrics were so parliament, lavifhly made on the minister, the members in opposition, in the British parliament, were spoken of in very indifferent terms. It was faid, that, while they thought the minister did not mean to go into the bufiness of Ireland, they called loudly for censure against him for not doing it; but when it was found that he meant feriously to take their affairs into consideration, they had then basely seceded, and wholly forsaken the interest of the kingdom. These censures were so loud. checked by that a member of the British house of commons wrote a letter to be communicated to his friends in Ireland, member of in which he reprefented, that however politic it might the British be to compliment the minister on the present occasion, it was neither very wife nor generous in the members commons. of the Irish parliament to be so ready in bestowing invectives against their old friends in England. With regard to the minister, it was alleged, that until he was driven to it by the measures adopted in Ireland, his conduct had been extremely equivocal, dilatory, and indecifive. The minority had been justly incenfed against him for having fo grofsly facrificed the honour of the nation and the dignity of parliament as to refuse any substantial relief to the Irish, until their own exertions had made it appear that every thing which could be done for them by the British parliament was not a matter of choice but of necessity. The minority, it was said, had earnestly and repeatedly laboured to procure relief for the people of Ireland; and if they had now contented themselves with a filent acquiescence in the minister's propositions, it was only until they should know whe-

Additional

To the propositions already mentioned, Lord North propositions added three others. I. For repealing the prohibition of Ireland, of exporting gold coin from Great Britain to Ireland. 2. For removing the prohibition to import foreign hops into Ireland, and the drawback on the exporta-

ther they would be fatisfactory to the people of Ire-

land; and because what was now done, appeared to be

more an act of flate than of mere parliamentary deli-

beration and discussion.

Ireland. its profperity, and thereby advance the walfare of exportation of woollens having been granted to Ire. Ireland. land, the Irish would naturally expect a share in the Turky trade, which, as matters flood, was not poffible, it having hitherto been a received opinion, that no Irishman could be elected a member of the Turky company. Notwithstanding all the satisfaction, however, with which the news of these bills were received in Ireland, it was not long before thoughts of a different kind began to take place. It was fuggested, New difthat a free trade could be but of little use, if held by a contentabeprecarious tenure. The repeal of the obnoxious laws gin to take was represented as an act of necessity, not of choice, place, on the part of the British parliament. When that neceffity, therefore, no longer existed, the same parliament might recal the benefits it had granted, and again fetter the Irish trade by restrictions perhaps more oppresfive than before. To fecure the advantages they now possessed, it was necessary that the kingdom should enjoy the benefits of a free constitution. For this the people looked up to the volunteer companies; and the idea of having such a glorious object in their power, augmented the numbers of those which had also been increased from other causes. They had now received Numbers the thanks of both houses of parliament, and thus had of the voobtained the fanction of the legislature. Thus many creefed. who had formerly fcrupled to connect themselves with a lawless body, made no scruple to enter their lifts. Government also engaged several of their friends in the volunteer cause. New companies were therefore raised; but whatever might be the political sentiments of the officers, the private men were universally attached to the popular caufe. The national fpirit was likewise kept up by several patriotic publications, particularly the letters figned Owen Roe O'Niel, which in an especial manner attracted the public attention; nor was the pulpit backward in contributing its part

in the same cause. To give the greater weight to their determinations, They form the volunteers now began to form themselves into bat, themselves talions; and in a very short time they were all united into battain this manner, excepting a small number of companies, which, from accidental causes, continued separate. The newspapers were filled with resolutions from the feveral corps, declaring Ireland to be an independent Ireland dekingdom, intitled by reason, nature, and compact, to indepenall the privileges of a free constitution; that no power dent kingin the world, excepting the king, with the lords and dom. commons of Ireland, had or ought to have, power to make laws for binding the Irish; and that, in support of these rights and privileges, they were determined to facrifice their lives and property.

Notwith landing all this zeal, however, the repre-Service befentatives of the people in Ireland feem yet to have haviour of behaved in a very supine and careless manner, and to the Irish have been entirely obedient to the dictates of govern. Parliament. ment. One of the house of commons declared in the month of April 1780, that " no power on earth, excepting the king, lords, and commons of Ireland, had a right to make laws to bind the people." " Every tion of foreign hops. 3. For enabling his majefly's member in the house (says Mr Crawford), one except-Irish subjects to become members of the Turky com- ed, acknowledged the truth of the proposition, either pany, and to export woollens in British or Irish bot- in express terms, or by not opposing it; and yet, howtoms to the Levant. In support of this last resolution ever astonishing it may appear, it was evident, that had his lordship urged, that it was necessary, because the the question been put, it would have been carried in

Ireland, the negative. The matter was compromised. The question was not put; and nothing relating to it was

entered on the journals. Irish mu-This inattention, or rather unwillingness, of the majority to ferve their country, was more fully manifested tiny bill made perin the case of a mutiny bill, which they allowed to be petuak made perpetual in Ireland, though that in England

Bad ten-

Mr Grat.

tan.

had always been cautiously passed only from year to year. After it was passed, however, some of the zealous patriots, particularly Mr Grattan, took great pains dency of it to fet forth the bad tendency of that act. He obserfet forth by ved, that flanding armies in the time of peace were contrary to the principles of the constitution and the fafety of public liberty; they had subverted the liberty of all nations excepting in those cases where their number was small, or the power of the sovereign over them limited in fome respect or other; but it was in vain to think of fetting bounds to the power of the chief magistrate, if the people chose by a statute to bind themselves to give them a perpetual and irresistible force. The mutiny bill, or martial law methodized, was directly opposite to the common law of the land. It fet afide the trial by jury and all the ordinary fleps of law : establishing in their stead a summary proceeding, arbitrary crimes and punishments, a secret sentence, and fudden execution. The object of this was to bring those who were subject to it to a state of implicit subordination, and render the authority of the fovereign absolute. The people of England, therefore, from a laudable jealously on all subjects in which their liberty was concerned, had in the matter of martial law exceeded their usual caution. In the preamble to the mutiny act, they recited part of the declaration of right, " that standing armies and martial law in time of peace, without the confent of parliament, are illegal. Having then flated the purity and fimplicity of their ancient constitution, and set forth the great principle of magna charta, they admitted a partial and temporary repeal of it; they admitted an army, and a law for its regulation, but at the same time they limited the number of the former, and the duration of both; confining the existence of the troops themselves, the law that regulated them, and the power that commanded them, to one year. Thus were the standing forces of England rendered a parliamentary army, and the military rendered effectually subordinate to the civil magistrate, because dependent on parliament. Yet the people of England confidered the army, even thus limited, only as a necessary evil, and would not admit even of barracks, left the foldier should be still more alienated from the state of a subject; and in this state of alienation have a post of strength, which would augment the danger arising from his situation. When the parliament of Ireland proceeded to regulate the army, therefore, they ought to have adopted the maxims of the British constitution, as well as the rules of British discipline. But they had totally departed from the maxims and example of the English, and that in the most important concern, the government of the fword. They had omitted the preamble which declared the great charter of liberty; they had left the number of forces in the breaft of the king, and under these circumftances they had made the bill perpetual.

It is probable that the bulk of the Itish nation did

not at first perceive the dangerous tendency of the bill Ireland. in question. The representations of Mr Grattan and others, however, foon opened their eyes, and a general diffatisfaction took place. This was much increased by two unfuccessful attempts in the house of commons; one to obtain an act for modifying Poyning's law; and the other for fecuring the independency of the judges. A universal difgust against the spiritless conduct of parliament now took place; and the hopes of the people were once more fet on the volunteers.

As it became now fomewhat probable that thefe companies might at last be obliged to affert the rights of their countrymen by force of arms, reviews were 99 judged necessary to teach them how to act in larger Reviews of bodies, and to give them a more exact knowledge of teers apthe use of arms. Several of these reviews took place pointed. in the course of summer 1780. The spectators in general were ftruck with the novelty and grandeur of the fight; the volunteers became more than ever the objects of efteem and admiration, and their numbers increafed accordingly. The reviews in 1781 exceeded those of the former year; and the dexterity of the corps who had affociated more early was now observed to be greater than that of the reft. More than 5000 men were reviewed at Belfast, whose performances were fet off to peculiar advantage by the display of 13 pieces of cannon. They showed their alacrity to serve their country in the field, on a report having arisen that the kingdom was to be invaded by the combined fleets of France and Spain; and for their spirited behaviour on this occasion they received a second time the thanks of both houses of parliament.

Such prodigious military preparations could not but alarm the British ministry in the highest degree; and it was not to be doubted that the Irish volunteers would come to the same extremities the Americans had done unless their wishes were speedily complied with. Still, however, it was imagined poffible to suppress them, and it was supposed to be the duty of the lord lieutenant to do fo. It was during the administration of the duke of Buckingham that the volunteers had grown into fuch confequence: he was therefore recalled, and the earl of Carlifle appointed in his place. Though it was impossible for the new governor to suppress the spirit of the nation, he sound it no difficult Shameful matter to obtain a majority in parliament. Thus every conduct of

the modification of Poyning's law, nor the repeal of parliament, the obnoxious parts of the mutiny bill, could be ob-The volunteers, exasperated at this behaviour, resolved at once to show that they were resolved to do themselves justice, and were conscious that they had power to do fo. At a meeting of the officers of the fouthern battalion of the Armagh regiment, commanded by the earl of Charlemont, the following resolutions were entered into December 28th Towns resolutions were 103 and effectual me- 103 A general thods ought to be purfued for rooting corruption out meeting of

much farther advanced, the 15th of February next

should be appointed for it.

These resolutions proved highly offensive to the friends of government, and every method was taken to difcourage it. On the appointed day, however, the representatives of 143 volunteer corps did attend at Dunganuon; and the refults of their deliberations were as follow. I. It having been afferted, that volunteers, Refolutions as fuch, cannot with propriety debate or publish their opinions on political fubjects, or on the conduct of parliament, or public men, it was refolved unanimoufly. that a citizen, by learning the use of arms, does not abandon any of his civil rights. 2. That a claim from any body of men, other than the king, lords, and commons of Ireland, to make laws to bind the people, is illegal, unconstitutional, and a grievance. 3. Refolwed, with one diffenting voice only, that the powers exercifed by the privy council of both kingdoms, under colour or pretence of the law of Poyning's, are unconftitutional and a grievance. 4. Refolved unanimoufly, that the ports of this country are by right open to all foreign countries not at war with the king; and that any burden thereupon, or obstruction thereto, excepting only by the parliament of Ireland, are unconstitutional, and a grievance. 5. Refolved, with one diffenting voice only, that a mutiny bill, not limited in point of duration from fession to fession, is unconstitutional and a grievance. 6. Refolved unanimoufly. that the independence of judges is equally effential to the impartial administration of justice in Ireland as in England, and that the refusal or delay of this right is in itself unconstitutional and a grievance. 7. Refolved, with II diffenting voices only, that it is the decided and unalterable determination of the volunteer companies to feek a redrefs of these grievances; and they pledged themselves to their country, and to each other, as freeholders, fellow-citizens, and men of honour, that they would, at every enfuing election, fupport only those who had supported them, and would support them therein, and that they would use all constitutional means to make such pursuit of redress foeedy and effectual. 8. Refolved, with only one diffenting voice, that the minority in parliament, who had supported those constitutional rights, are intitled to the most grateful thanks of the volunteer companies, and that an address to the purpose be figned by the chairman, and published with the refolutions of the prefent meeting. 9. Refolved unanimoufly, that four members from each county of the province of Ulfter, eleven to be a quorum, be appointed a committee till the next general meeting, to act for the volunteer corps, and to call general meetings of the province as occasion requires. 10. The committee being appointed, and the time of general meetings, and fome other affairs of a fimilar nature fettled, it was refolved unanimously, that the court of Portugal having unjustly refused entry to certain Irish commodities, the delegates would not confume any wine of the growth of Portugal, and that they would use all their influence to prevent the use of the said wine, excepting what was then in the kingdom, until fuch time as the Irish exports should be received in the kingdom of Portugal. 11. Refolved, with only two diffenting voices, that they hold the right of private judgment in mat-

Ireland meeting before the prefent fession of parliament was ters of religion equally facred in others as in them- Ireland. felves; and that they rejoiced in the relaxation of the penal laws against the Papilts, as a measure fraught with the happiest consequences to the union and pro-

sperity of the inhabitants of Ireland.

While these proceedings took place at Dungannon, the ministry carried all before them in parliament. In Ministerial a debate concerning the exclusive legislative privileges party preof Ireland, a law member, speaking of the arbitrary fively in acts of England, afferted, that " power constituted parliament, right;" and a motion that the commons should be declared the representatives of the people was carried in the negative. These scandalous proceedings could not but halten the ruin of their cause. The resolutions entered into at the Dungannon meeting were received throughout the kingdom with the utmost applause. A few days after, Mr Grattan, whose patriotism has been Mr Gratalready taken notice of, moved in the house of com- tan's momons for a long and spirited address to his majesty, decla. tion for an mons for a long and apprice address this imprey, seet a ring the rights of the kingdom, and afferting the principle address, de-which now began to prevail, that Ireland could legally indepenbe bound by no power but that of the king, lords, and dency of commons of the country; though the British parliament treland had assumed such a power. This motion was at prefent rejected. rejected by a large majority; but their eyes were foon enlightened by the volunteers.

These having now appointed their committees of correspondence, were enabled to communicate their fentiments to one another with the utmost facility and quickness. An affociation was formed in the name of Declaration the nobility, representatives, freeholders, and inhabi- of the votants of the county of Armagh, wherein they fet forth lunteers to the necessity of declaring their fentiments openly re-that purspecting the fundamental and undoubted rights of the pole. They declared, that, in every fituation in nation. life, and with all the means in their power, they would maintain the constitutional right of the kingdom to be governed only by the king and parliament of Ireland; and that they would, in every inftance, uniformly and strenuously oppose the execution of any statutes, excepting such as derived their authority from the parliament just mentioned; and they pledged themselves, in the usual manner, to support what they now declared

with their lives and fortunes.

This declaration was quickly adopted by all the other counties, and fimilar fentiments became univerfally avowed throughout the king. The change in the British ministry in the spring of 1782 facilitated the 108 wishes of the people. The duke of Portland, who Favourable came over as lord lieutenant in April that year, fent a meffage most welcome message to parliament. He informed fent to parthem, that, "his majefty, being concerned to find the duke that discontents and jealousies were prevailing among of Porthis loyal subjects in Ireland, upon matters of great land. weight and importance, he recommended it to parliament to take the same into their most serious consideration, in order to fuch a final adjustment as might give mutual fatisfaction to his kingdoms of Great Britain and Ireland."

Mr Grattan, whose patriotic efforts had never been Mr Gratflackened, now ventured to propose a second time in tan's second parliament the address which had been rejected before attempt in On the 16th of April he began a speech to this pur- his address. pose with a panegyric on the volunteers, and the late conduct of the people. The Irish, he said, were no

ing itself to the rest of the world in fignal instances of glory. In the rest of Europe the ancient spirit was expired; liberty was yielded, or empire loft; nations were living upon the memory of palt glory, or under the care of mercenary armies. In Ireland, however, the people, by departing from the example of other nations, had become an example to them. Liberty, in former times, and in other nations, was recovered by the quick feelings and rapid impulse of the populace. But in Ireland, at the present period, it was recovered by an act of the whole nation reasoning for three years on its fituation, and then rescuing itself by a fettled fense of right pervading the land. The meeting of the delegates at Dungannon was an original meafure; and, like all of that kind, continued to be matter of furprife, until at last it became matter of admiration. Great measures, such as the meeting of the English at Runny Mead, and of the Irish at Dungannon, were not the confequences of precedent, but carried in themselves both precedent and principle; and the public cause in both inflances would infallibly have been loft had it been trufted to parliament. The meeting at Dungannon had refolved, that the claim of the British parliament was illegal; and this was a conflitutional declaration. The Irish volunteers were affociated for the prefervation of the laws, but the conduct of the British parliament subverted all law. England, however, had no reason to sear the Irish volunteers: they would facrifice their lives in her caufe. The two nations formed a general confederacy. The perpetual annexation of the crown was a great bond. but magna charta was a greater. It would be eafy for Ireland to find a king; but it would be impossible to find a nation who could communicate to them fuch a charter as magna charta; and it was this which made their natural connection with England. The Irish nation were too high in pride, character, and power, to fuffer any other nation to make their laws. England had indeed brought forward the question, not only by making laws for Ireland the preceding fession, but by enabling his majefty to repeal all the laws which England had made for America. Had she consented to repeal the declaratory law against America? and would she refuse to repeal that against Ireland? The Irish nation were incapable of submitting to such a diftinction.

Mr Grattan now found his eloquence much more powerful than formerly. The motion which, during this very fession, had been rejected by a great majority, was now agreed to after a fhort debate, and the address to his majefty prepared accordingly. In this, after thanking his majefty for his gracious meffage, and declaring their attachment to his person and government. they affured him, that the subjects of Ireland are a free people; that the crown of Ireland is an Imperial crown inseparably annexed to that of Britain fon which connection the interests and happiness of both nations effentially depend : but the kingdom of Ireland is diflinct, with a parliament of its own; that there is no body of men competent to make laws to bind Ireland, except the king, lords, and commons thereof, nor any other parliament that hath any power or authority of any fort whatfoever, in this country, except the parliament of Ireland. They affured his majefty, that they

Ireland. longer a divided colony, but an united land, manifelt humbly conceive, that in this right the very effence of Ireland. their liberties did exift; a right which they, on the part of all Ireland, do claim as their birthright, and which they cannot yield but with their lives. They affured his majefty, that they had feen with concern certain claims advanced by the parliament of Great Britain, in an act entitled, " For the better fecuring the dependency of Ireland;" an act containing matter entirely irreconcileable to the fundamental rights of the nation. They informed his majefty, that they conceived this act, and the claims it advanced, to be the great and principal cause of the discontents and jealoufies in the kingdom. They affured him, that his commons did most fincerely wish, that all the bills, which become law in Ireland, should receive the approbation of his majesty under the seal of Great Britain; but yet, that they conceived the practice of fupprefling their bills in the council of Ireland, or altering them any where, to be another just cause of discontent and jealousy. They further affured his majefty, that an act intitled, " For the better accommodation of his majefty's forces," being unlimited in du-'ration, and defective in fome other circumstances, was another just cause of jealoufy and discontent. These, the principal causes of jealousies and discontent in the kingdom, they had submitted to his majesty, in humble expectation of redress; and they concluded with an affurance, that they were more confident in the hope of obtaining redrefs, as the people of Ireland had been, and were, not more disposed to share the freedom of England, than to support her in her difficulties, and to fhare her fate.

To this remarkable addrefs a most gracious answer It is gracion was given. In a few days the lord lieutenant made a oufly refpeech to both houses; in which he informed them, ceived, that, by the magnanimity of the king, and wisdom of the British parliament, he was enabled to assure them, that immediate attention had been paid to their reprefentations, and that the legislature of Britain had concurred in a refolution to remove the causes of their discontents, and were united in a defire to gratify every wish expressed in the late address to the throne; and that, in the mean time, his majefly was graciously difposed to give his royal affent to acts to prevent the fuppressing of bills in the Irish privy council, and to li-

mit the mutiny-bill to the term of two years. The joy which now diffused itself all over the king-Extrem dom was extreme. In 1731, while the duke of Dorfet was lord-lieutenant, the inhabitants were numbered, and it was found that the four provinces contained as follows:

Connaught 21604 Leinfler 203687 Munfter 115130 Ulfter 360532 700453 Proteflants 221780 482044 158020 1390768 Papifts

There are 44 charter working schools at present in Ireland, wherein 2025 boys and girls are maintained

and educated. Thefe fehools are maintained by an an-ircland, nual bounty of 1000. by a tax upon hawkers and ped-lars, and by fubferiptions and legacies. The children admitted are thofe born of Poplin parents, or fuch as would be bred Papitls if neglected, and are found of limbs. Their age mult be from fix to ten; the boys at 16, and the girls at 14, are apprenticed into Prote-flant families. The first school was opened in 1734-Five pounds are given to every perfon educated in thefe schools upon his or her marrying a Proteflant. An English act of parliament, lately tolerated the Catholic religion in Ireland, and by that means has relieved thoufands of ufeful fubjects.

The return of houses in Ireland for the year 1754, was 395,439; and for the year 1766, it was 424,046. Supposing therefore the numbers to have increased at the same rate, the number of houses now cannot be less than 454,130; which, allowing five perfons to a family, will make the number of inhabitants 2,260,650; but as the return of houses by hearth collectors is rather under than above the truth, and as there are many families in every parish who are by law excused from that tax, and therefore not returned, the number on a moderate estimate will be 2,500,000. Sir W. Petty reckoned 160,000 cabins without a chimney; and if there be an equal number of fuch houses now, the number of people will be above 3,000,000, Mr Molyneux fays, " Ireland has certainly been better inhabited formerly; for on the wild mountains between Ardmach and Dundalk, are observable the marks of the plough, as they are also on the mountains of Altmore. The fame has been observed in the counties of Londonderry and Donnegal. Mountains that are now covered with bogs have been formerly ploughed; for when you dig five or fix feet deep, you discover a proper soil for vegetation, and find it ploughed into ridges and furrows : a plough was found in a very dead bog near Donnegal; and an hedge, with fome wattles, flanding under a bog that was five or fix feet in depth. The flump of a large tree was found in a bog ten feet deep at Castle Forbes; the trunk had been burnt, and some of the cinders and ashes still were lying on the stump. Mr Molyneux further fays, that on the top of an high mountain, in the north, there were then remaining the streets and other marks of a large town.

Beauty feems to be more diffuled in England, a-Appearance mong the lower ranks of life, than in Ireland; which and she are may, however, be attributed to the mere modes of li inhabitants. In England, the meanest cottager is better fed, better lodged, and better dressed than the most opulent farmers here, who, unaccuiformed to what-our

but in deep potations of aquavitæ.

From this circumflance, we may account for a fact reported by the officers of the army here. They fay, that the young fellows of Ireland, who offer to culift, are more generally below the given height than in England. There can be no appeal from their tellimony; for they were Irifh, and the flandard is an infallible tell. No reafon, indeed, can be given why: the caufes which promote or prevent the growth of other animals, floudd not have finillar effects upon the human fpecies. In England, where there is no flint of provisions, the growth is not checked; but, on the contrary, it is extended to the utmost bound of na-

peafants reckon the comforts of life, know no luxury

Ireland. ture's original intention: whereas, in Ireland, where food is neither in the fame quantity nor of the fame quality, the body cannot expand itself, but is dwarfed and flunted in its dimensions. The gentlemen of Ireland are full as tall as those of England; the difference, then, between them and the commonalty, can only

proceed from the difference of food.

The inhabitants, in general, of this kingdom, are very far from what they have too often and unjustly been represented by those of our country who never faw them, a nation of wild Irish. Miserable and oppressed, as by far too many of them are, an Englishman will find as much civility in general, as amongst the same class in his own country; and, for a small pecuniary confideration, they will exert themselves to please you as much as any people, perhaps, in the king's dominions. Poverty and oppression will naturally make mankind four, rude, and unfociable, and eradicate, or at least suppress, all the more amiable principles and passions of humanity. But it should feem unfair and ungenerous to judge of, or decide againft, the natural disposition of a man reduced by indigence and oppression almost to desperation. commerce, agriculture, and arts, but call forth the dormant activity of their genius, and rouse the native fpirit of enterprize, which now lies torpid within them ; let liberal laws unfetter their minds, and plenty cheer their tables; they will foon flow themfelves deferving to rank with the most respectable societies in Europe.

Account of Ereland.

The bogs wherewith Ireland is in some places overthe bogs in grown, are not injurious to health, as is commonly imagined; the watery exhalations from these are neither fo abundant nor fo noxious as those from marshes, which become prejudicial from the various animal and vegetable fubstances which are left to putrify as foon as the waters are exhaled by the fun. Bogs are not, as one might suppose from their blackness, masses of putrefaction; but, on the contrary, they are of fuch a texture, as to refult putrefaction above any other fubflance we know of A shoe, all of one piece of leather, very neatly flitched, was taken out of a bog fome years ago, yet entirely fresh ;- from the very fafhion of which, there is fcarce room to doubt that it had lain there fome centuries. Butter, called roufkin, hath been found in hollowed trunks of trees, where it had been hid fo long, that it was become hard and almost friable, yet not devoid of unctnosity; that the length of time it had been buried was very great, we learn from the depth of the bog, which was ten feet, that had grown over it. But the common phenomenon of timber-trees dug out of these bogs not only found, but also so embalmed as afterwards to defy the injuries of time, demonstrate the antiseptic quality of them. The horns of the moofe deer must have lain many centuries in a bog ; for the Irish histories do not recognize the existence of the animal whereon they grew. Indeed, human bodies have, in many places, been dug up entire, which must have lain there for ages. The growth of bogs, however, is variable in different places, from the variety of conditions in the fituation, foil, humidity, and quantity of vegetable food; in some places it is very rapid, in sothers very flow; and therefore their altitudes cannot afford any certain measure of time. In the manufacturing counties of the north, peat-fuel has become fo fearce, that

Nº 169.

turburies let from five to eight guineas an acre. In Ireland. fome places they are fo eradicated, there does not remain a trace of them, the ground being now converted into rich meadows and fweet paflures, If we truft to authorities, we must conclude that Trade of

Ireland was not originally inferior to England, either Ireland in the fertility of the foil or falubrity of the climate. on the in-When this country shall have felt the happy effects of the late concessions and indulgencies of the British parliament, by repealing feveral acts which restrained the trade of this kingdom with foreign ports, and allowing the exportation of woollen manufactures and glass, and shall have received further indulgencies from the fame authority; and when the spirit of industry shall be infused, in consequence of it, into the common people; their country will not be inferior to any other on the globe under the fame parallel. It is very difficult to fay, whether foreign or domestie causes have operated most powerfully in laying waste this fruitful country; which, by being relieved from their late unnatural prohibitions, will be enabled to furnish a grand proportion of supplies to Great Britain, and will unavoidably become of vast importance, by its reciprocal trade, in restraining the increase of that of France, who cannot carry on this important branch of traffic without the affiftance of Irih wool. The wool of France is fhort and coarfe, being, in the language of the manufacturers, neither fine in the thread nor long in the staple. This obliges them to have recourfe to the wool of Ireland, which possesses both these qualities. Affilted by a pack of Irish wool, the French are enabled to manufacture two of their own; which they will no longer be enabled to procure, as the Irish will now work up their own wool which they used to export; great part of which found its way to France, and enabled them to fupply other markets, to the great prejudice of Britain. The happy effects of it have been already felt; for notwithstanding it was so late as December 23. 1789, that the royal affent was given to the taking off their reftraints on woollen exports, it appears, that on January 10th following, an exportentry was made at the custom-house of Dublin of 1300 yards of ferge for a foreign market, by William Worthington, Efq.

IRENÆUS (St), a bishop of Lyons, was born in Grecce about the year 120. He was the disciple of Pappias and St Polycarp, by whom, it is faid, he was fent into Gaul in 157. He stopped at Lyons, where he performed the office of a prieft; and in 178 was fent to Rome, where he disputed with Valentinus, and his two disciples Florious and Blastus. At his return to Lyons, he fucceeded Photinus, bishop of that city; and fuffered martyrdom in 202, under the reign of Severus. He wrote many works in Greek, of which there only remains a barbarous Latin version of his five books against heretics, some Greek fragments in different authors, and pope Victor's letter mentioned by Eusebins. The best editions of his works are those of Erasmus, in 1526; of Grabe, in 1702; and of Father Massuet, in 1710. St Irenæus's style is close, clear, and ftrong, but plain and fimple. Dodwell has composed fix curious differtations on the works of St

Irenæus. He ought not to be confounded with St Irenæus the deacon, who in 275 fuffered martyrdom in Tufcany,

under the reign of Aurelian; nor with St Iræneus, Trene bishop of Sirmich, who suffered martyrdom on the 25th of March 304, during the perfecution of Dioclefian and Maximianus.

IRENE, empress of the east, celebrated for her valour, wit, and beauty; but deteftable for her cruelty, having facrificed her own fon to the ambition of reign-

ing alone. She died in 803

IRESINE, in botany : A genus of the pentandria order, belonging to the dioecia class of plants; and in the natural method ranking under the 54th order, Mifcellange. The male calvx is diphyllous, the corolla pentapetalous; and there are five nectaria. The female calvx is diphyllous, the corolla pentapetalous; there are two feffile fligmats, and a capfule with flocky

IRIS, in physiology, the rainbow. The word is Greek, 1915, Supposed by some to be derived from 1190 "I speak, I tell;" as being a meteor that is supposed to foretel, or rather to declare rain. See RAINBOW.

Lunar IRIS, or Moon-rainbow. See RAINBOW

Iris.

IRIS, in anatomy, a ftriped variegated circle round the pupil of the eye, formed of a duplicature of the

uvea. See ANATOMY, p. 767.

IRIS is also applied to those changeable colours which Sometimes appear in the glasses of telescopes, microscopes, &c. fo called from their fimilitude to a rainbow. The same appellation is also given to that coloured spectrum, which a triangular prismatic glass will project on a wall, when placed at a due angle in the fun-beams

IRIS, the Flower de Luce, or Flag-flower, &c. in botany: A genus of the monogynia order, belonging to the triandria class of plants; and in the natural method ranking under the fixth order, Enfata. The corolla is divided into fix parts; the petals alternately

reflexed; the fligmata refembling petals

There are 44 species, all herbaceous flowering perennials, both of the fibrous, tuberous, and bulbous rooted kind, producing thick annual stalks from 3 or 4 inches to a yard high, terminated by large hexapetalous flowers, having three of the petals reflexed quite back and three erect; most of which are very orna-

mental, appearing in May, June, and July. Culture. All the species are easily propagated by offsets from the roots, which should be planted in September, October, or November, though almost any time from September to March will do. They may also be raised from seed, which is the best method for procuring varieties. It is to be fown in autumn, foon after it ripens, in a bed or border of common earth, and raked in. The plants will rife in the fpring, and

are to be transplanted next autumn.

Properties. The roots of the Florentine white iris, when dry, are supposed to have a pectoral virtue. They have an agreeable smell, resembling that of violets; and hence are used in perfumes, and in flavouring of liquors. When recent, they have a bitter, acrid, naufeous tafte; and when taken into the body, prove frongly cathartic; on which account they have been recommended in dropsies, in the dose of three or four feruples .- The juice of the species called ballard acorus, or yellow flag-flower, is also very acrid, and hath been found to produce plentiful evacuations from the VOL. IX. Part I.

bowels when other means had failed. For this purpole, it may be given in doles of 80 drops every hour or two; but the degree of its acrimony is to uncertain. that it can hardly ever come into general use. The fresh roots have been mixed with the food of swine bitten by a mad dog, and they escaped the disease, when others, bitten by the fame dog, died raving mad, Goats eat the leaves when fresh; but cows, horses, and fwine, refuse them. Cows will eat them when dry, The roots are used in the island of Jura for dying black .- The roots or bulbs of a species growing at the Cape, are roafted in the ashes and used as food by the natives : they are called oenkjes, and have nearly the fame taste with potatoes. The Hottentots, with more reflection than generally falls to the share of favages, use the word oenkjes in the fame fenfe in which Virgil used that of arifle, that is, for reckoning of time; always beginning the new year whenever the oenkjes push out of the ground, and marking their age and other events by the number of times in which in a certain period this vegetable has made its appearance. - The Siberians cure the venereal difease by a decoction of the root of the Iris Sibirica, which acts by purging and vomiting. They keep the patient eight days in a stove, and place him in a bed of the leaves of the arctium lappa, or common burdock, which they frequently change till the cure is effected.

IRIS-Stone. See Moon-Stone.

IRON, one of the imperfect metals, but the hardest and most useful as well as the most plentiful of them all, is of a livid whitish colour inclining to grey, and internally composed to appearance of small facets : fufceptible of a fine polish, and capable of having its hardness more increased or diminished by certain chemical processes than any other metal.

It is very generally diffused throughout the globe, Diffused albeing frequently found mixed with fand, clay, chalk, and over the being likewise the colouring matter of a great number globe. of flones and earth. It is found also in the ashes of vegetables, and in the blood of animals, in fuch abundance, that fome authors have attributed both the colours of vegetables and of the vital fluid itself to the iron contained in them. In confequence of this abundance the iron ores are extremely numerous.

1. Native iron, formerly thought not to have an found naexistence any where, is now certainly known to have tive in Sibeen met with in feveral places. It is, however, by negal, &c. no means common, but occurs fometimes in iron mines, Margraaff found a fibrous kind of it at Eibenstock in Saxony, and Dr Pallas found a mass in Siberia weighing 1600 pounds. Mr Adanson likewise informs us, that native iron is common about Senegal; but fome naturalists are of opinion that these pieces which have been taken for native iron, are in reality artificial, and have been accidentally buried in the earth. The large piece mentioned by Dr Pallas is of that species called red fbort, which is malleable when cold, but brittle when red hot .- A mass of a similar nature is said to have been lately found in South America.

This American mass of iron was discovered by some Phil Trans-Indians in the district of Santiago del Estero in the vol. 78. midst of a wide extended plain. It projected about a foot above the ground, and almost the whole of its upper furface was visible; and the news of its being found in a country where there are no mountains, nor

even the smallest stone within a circumference of 100 leagues, could not but be very furprifing. Though the journey was attended with great danger on account of the want of water, and abundance of wild beafts in these deferts, some private persons, in hopes of gain, undertook to visit this mass; and having accomplished their journey, fent a specimen of the metal to Lima and Madrid, where it was found to be very pure foft

As it was reported that this mass was only the extremity of an immense vein of the metal, a commission was given to Don Michael Rubin de Celis to examine the fpot; and the following is an abstract of his ac-

"The place is called Otumpa, in lat. 27. 28. S. and the mass was found almost buried in pure clay and ashes. Externally it had the appearance of very compact iron; but internally was full of cavities, as if the whole had been formerly in a liquid state. I was confirmed in this idea (fays our author), by observing, on the furface of it, the impression of human feet and hands of a large fize, as well as of the feet of large birds, which are common in this country. Though these impressions seem very perfect, yet I am perfuaded that they are either a lufus natura, or that impressions of this kind were previously upon the ground. and that the liquid mass of iron falling upon it received them. It refembled nothing fo much as a mass of dough; which having been ftamped with impressions of hands and feet, and marked with a finger, had afterwards oeen converted into iron.

" On digging round the mass, the under furface was found covered with a coat of fcoriæ from four to fix inches thick, undoubtedly occasioned by the moiflure of the earth, because the upper surface was clean. No appearance of generation was observed in the earth below or round it to a great distance. About two leagues to the eaftward is a brackish mineral spring, the only one to be met with in all the country. Here there was a very gentle afcent of between four and fix feet in height, running from north to fouth; all the reft being as perfect a level as can be imagined. The earth in every part about this spring, as well as near the mass, is very light, loofe, and greatly resembling ashes even in colour. The grass of the adjacent parts is very short, small, and extremely unpalatable to cattle; but that at a distance is long and extremely grateful to them : from all which circumstances it is probable that this mass was produced by a volcanic explosion. Its weight might be estimated at about 300 quintals .-It is likewise an undoubted fact, that in these forests there exists a mass of pure iron in the shape of a tree with its branches. At a little depth in the earth are found stones of quartz of a beautiful red colour, which the honey gatherers, the only perfons who frequent this country, make use of as flints to light their fires. They had formerly carried some of them away on account of their peculiar beauty, being spotted and fludded as it were with gold. One of these, weighing about an ounce, was ground by the governor of the diffrict, who extracted from it a drachm of gold."

The native iron faid to have been found about Senegal has a cubical form; and out of this the black inhabitants make different kinds of veffels for their own use. Some maffes have been found in a polyhe-

dral granulated form, and of a bright yellow colour : but which, on being polished, show the proper colour of the metal. Mr Bergman informs us, that the great mass of native metal found in Siberia resembles forged iron in its composition, a centenary, or 63 grains, vielding 40 cubic inches of inflammable air; and from many experiments it appears, that ductile iron yields from 48 to 51 cubic inches of the same kind of air. Dr Matthew Guthrie informs us, that "the pores of this iron were filled with a yellow vitreous matter, of fuch hardness as to cut glass." The cells are lined with a kind of varnish contiguous to the glassy substance within.

2. The calciform ores are either composed of the Calciforni blackish, blackish-brown, or red calx of the metal; the ores. former being in some measure magnetic, in consequence of the phlogiston it contains; the latter showing no-

thing of this property until it be roafted.

The name of calciform may be applied to all the ores of this metal, excepting the native iron already mentioned, and the native Pruffian blues, of which we shall afterwards treat. All of them are mixed with different minerals, and generally take their colour from that of the calx of iron which is prevalent in them. Mr Kirwan enumerates a great many different species.

3. Steel ore, Stachlerz, the ferrum chalybeatum Steel ore. Linnai, and minera ferri nigra of Cronfledt. This is of a dark colour, folid, and compact, but with difficulty firiking fire with fteel; reducible to a black powder, obedient to the magnet, and fomewhat malleable when red hot; affording from 60 to 80 per cent. of good iron. It is met with in Sweden, the Isle of Elbe, and North America. The ferrum teffulare and minera ferri crystallizata of Wallerius, belongs to this species, but is fomewhat less magnetic. Our author denominates it crystallized iron ore in an octohedral or cubic form.

4. The magnet, according to Fourcroy, is a muddy Magnets iron ore, which, however, fome authors suppose to be very near the metallic state. Mr Kirwan favs it differs but little from the foregoing, only that it has lefs luftre. There are two kinds, the fine and the coarfe grained, of which the latter lofe their power the foonest. When heated red hot, it smells of supposed Our author thinks it may contain nickel, as this femi- to contain metal is found to possess a magnetic property when pu-nickel.

rified to a certain degree.

5. The brown calx of iron combined with plumba- Brown orego, black eisen glimmer, schwartz, eisen bahen or eisenman, confifts of black shining scales more or less magnetic, affording, according to Mr Rinman, 26 per cent. of

iron, the rest being plumbago.

6. The brown calx of iron united with the white White calx of manganefe, and mild calcareous earth in various ores. proportions. These constitute the white ores of iron, on which Mr Bergman has given a differtation.-"They have received (fays he) divers denominations from the fingular heat with which they are accompanied. Their texture is almost the same with that of the calcareous stone, yet it is rarely found compact, and composed of impalpable particles. It is sometimes squamous, sometimes granulated with small distinct particles, some of them shining, but in general spathous. This description, however, is not meant for their complete and perfect state; for the figure of their parts is more or less destroyed by spontaneous calcinaIron. tion; nay, the whole mass is at length resolved into a powder : fometimes it is found stalactitic, fistulous and ramous, cellular, or even germinating like mofs. Sometimes, though very feldom, they have fufficient hardness to ftrike fire with steel; but though, when found mixed with flint and newly dug up, they are of this kind, yet they foon lofe the property we speak of. When perfect, they generally refemble the calcareous ftone, unless when exposed for some time to the air, by which the union of their parts are gradually diminished. Their colour is white, but the surface which comes into contact with the air grows gradually brown, or even blackish; yet as long as the iron which is converted into an ochre remains in them, they have a ferruginous hue; but though the furface is thus changed, the internal parts remain the fame, and, on being filed or broken, exhibit the natural colour. -This change is effected by the air, not upon the iron, as is commonly believed, but on the white calx of manganese which is dephlogisticated by the atmos-

> "The frecific gravity of the ore, when perfect, varies between 3,640 and 3,810 and is diminished according to the degree of calcination. The ore whose particles are quite feparated is from 2.5 to 2.9; but that which is not perfectly corroded, from 3.3 to 3.6. It is rarely attracted by the magnet, whether perfect or calcined, though the metallic part fometimes

amounts to nearly one half the weight.

A moun-

Sweden.

The white ores of iron are found, though in very tain of iron fmall quantity, in Sweden. The Suart-begger, or Black ore in De- Mountain, in Dalecarlia, has its name from its furface, careous vein with shining particles of spar, and a white ore of iron, together with a galena, pseudogalena, black ore of iron, pyrites, fchoerl, and garnet intermixed. In the old mines at Halleforo, or the eaftern mines, the rock itself appears to consist of a tains about Smialkald in Germany contain these ores. companied with copper, and others with hæmatites. power The hill of Arzberg, fituated at Eifenartz in Upper Si nia, is 6000 fathoms in circuit, 900 in diameter, and 450 in height. According to fome accounts the ore is irregularly accumulated and concreted, confifting of maffes of quartz charged with argillaceous earth and white ore of iron; but, according to others, the ore is found there not only in heaps, but in various veins."

This ore, when analysed, gave 38 parts of the brown calx of iron, 24 of the white calx of manganese, and 50 of mild calcareous earth. Another from West Silvathreg, yielded 22 of the brown calx of iron,

28 of the white calx of manganele, and 50 of mild calcareous earth. The aerial acid is used, and is united not only to the earth, but also to the metallic calx. The above proportions of the crude materials in the ore of Eisenartz, would yield, according to Mr Kirwan, 38 parts of calcareous earth, 38 of iron in its metallic state, and 24 of manganese. Many others are poorer, and fome to fuch a degree as fearcely to deferve the name of an ore. They abound also in France and Spain, and are found fometimes in heaps, fometimes also forming veins, firata, or even whole mountains. Mr Bergman never found them contain any organised bodies; a mark (fays he) by which the most ancient productions of the earth have been diftinguished. When this iron ore bears a flalactitical appearance, and is very white, it is called flos ferri, and eifen bluth. An hundred parts of it yield 65 of calcareous earth, and 35 of calx of iron; which, according to Rinman, produce 27 of iron in its metallic state.

7. Magnetic fand. Of this kind is the black fand Black fand of Virginia, whose specific gravity is about 4.600, of Virgi-

and contains half its weight of metal.

From an account inferted in the Philosophical Transactions for 1763, we are informed, that there are very large quantities of this fand iron ore in Virginia; perhaps as large as of any other kinds of iron: ore. It is so pure, that it requires a mixture of bog-ore, or of flags from other fmeltings, to reduce it to a metallic form. The iron and fteel produced from it were above 60 per cent. or from 50 to 85; the quality of both extremely good; and two fmall bars were fent as a fample to the museum of the Royal Society of Lonlecarlia in which is grown black by calcination. It is high, and don. Large strata of black fand iron-ore are found in naked on the fummit, which is croffed by a broad cal- Portugal. even at a confiderable diffance from the feashore, or from any running waters. A very great part of this black fand is attracted by the magnet. There is also found, particularly in France, a black, heavy, unmagnetic fand, of the filiceous kind, which is faid to contain iron and zinc in great quantity. Mr white ore of iron; but in other places it is either found Kirwan, p. 143, of his Mineralogy, speaks of a filicein small quantity, or very poor in metal. Many moun- ous fand confolidated by semiphlogisticated calx of iron, which does not crumble into fand when powder-In one called Stablbegger, a broad vein occurs almost ed. It is generally of a black or brown colour; but horizontal, and from 25 to 30 fathoms thick. It congrows reddiff or yellowift, and moulders by exposure fifts of an irregular spar, in which are dispersed quartz to the air. It does not effervesce with acids, unless it and pieces of the ore, which are found of a better contains teffaceous particles, which is frequently quality in proportion as they are more deeply feated. the case; it is even frequently covered with shells. The uppermost side, which is pendant, consists of a He adds, that the agglutinating power of folutions of fandy stone from 9 to 20 fathom high; but the iron has been shown by a stony concretion of this fort lower is margaceous, and is found more indurated to- that had been long buried in the fea, and is mentionwards the lower parts; and at the very lowest is ex- ed in a paper of Mr Edward King in the Philosophitended by a blue mica: the fides fearcely cohere to cal Transactions for 1779. Mr Rinman, however, the vein. The whole mountain in Naussavia consists of has found that dephlogisticated calces of iron, and para yellowish ore of iron, certain veins of which are ac- ticularly its folutions in mineral acids, have no binding

8. Red calx of iron indurated and combined with a fmall quantity of clay, frequently with manganefe,-Fourcroy calls this a muddy iron-ore, which feems to red ore. be formed in the manner of stalactites, and deriving its name from its colour, which is commonly red, or the colour of blood, though not without variations. Mr Kirwan favs, that "it is generally of a red, vellow, purple, or brown colour, of a metallic luftre, and very hard, though feldom capable of giving fire with fteel." Fourcroy tells us, that it is usually composed of layers which cover each other, and are themselves formed of

convergent needles, the external part being covered with tubercles; and that it is not only diffinguished by the colour, but by the form, as the hæn atites bo. trytes, in the form of bunches of grapes. Mr Kirwan tells us, that its ftructure is either folid, granular, fealy, or fibrous; that it occurs in shapeless masses, in a stalactitical form; or, according to Gmelin, crystallized in regular forms, though M. de Lisle denies this. In fome places it forms whole mountains, and affords from 40 to 80 per cent, of iron. Mr Gerhard extracted alum from it, which affords a proof of its containing clay; and Mr Hilan found it also to contain mangancie. In its natural flate it is not affected by the magnet; but by torrefaction it becomes black and magnetic.

Ochree of different kinds

9. Hæmatitical, red, vellow, and brown ochres Thefe are, by Mr Kirwan, intitled " hæmatites in a loofe form, mixed with a notable proportion of argill" (clay.) They are diftinguished, he fays, from clays, by containing a larger proportion of martial particles. To this species belong the ores which become brown by calcination, and likewife magnetic. They are fometimes mixed with clay or calcareous earths; in which case these ones effervesce with acids. The hamatites, or blood ftones, have their names, not on account of their external colours, but because, when reduced to powder, they produce a red or blood-colour. The vellow hæmatites, however, only produce the fame colour by pulverifation. They are productive of very good iron, and are found in great abundance in the province of Galiza in Spain. The inhabitants of Compostella, the capital, make a good commerce of these beniatites of the hardest kind for the burnishing gold leaves, and various other metals. A dark blue kind, fomewhat fimilar to black-lead, is principally employed for these purposes. They are found in many parts of Europe, fometimes forming whole mountains. The most extraordinary ores of this kind, both on account of their forms and of their various and brilliant colours, are found in the island of Elba near the coast of Tufcany. The crystallized ores are here the most beautiful and the most common, though not to be met with any where elfe. They exhibit various gradations of the finest colours, as red, violet, blue, green, yellow, brown, and black; infomuch that, according to Coudrai's expression, they look like so many clusters of emeralds, fapphires, diamonds, rubies, and topazes. E. Peni and Mongez affirm, that these ores are mineralized only by the aerial acid; tho' Coudrai is of opinion, that they contain fulphur alfo. Besides these beautiful crystallized ores, this island contains also many others; being indeed little other than a group of iron-mountains. The ores in general produce the very best kind of iron.

Emery.

10. Emery, fmyris, is a grey or reddish iron-ore. found in great quantity on the islands of Jersey and Guernfey. It is extremely hard, yielding in this refpect to no substance except the diamond itself. It is also very refractory, and for these reasons is not used for the fake of the metal it contains, nor indeed is it well known what proportion is contained in it. " The best fort (fays Mr Kirwan) is of a dark grey colour, but becomes brown, and in great measure magnetic, by calcination: other forts are of a rufty reddiff white or yellowish colour. Its specific gravity is from 3.000 to

4.000. It is used in polishing glass and metals; for from which purpose it must first be ground down and levigated in mills.

11. The argillaceous ores. These comprehend the Bog ores, ochres, and more particularly those mentioned by &c. Foureroy under the name of box-ores of iron, which are commonly met with disposed in beds, and seemingly deposited by waters. Mr Fourcroy informs 113, that this kind of ore is very often in the form of spherical bodies either regular or irregular. Organic matters, fuch as wood, leaves, bark, shells, &c. are not unfrequently found in the state of bog ores. This kind of transition feems to indicate an analogy betwist iron and organic fubstances. In the wood of Boulogne near Auteuil there is a mine of bog-ore of iton, in which vegetable substances become mineralized almost immediately under our eyes.

Mr Kirwan diftinguishes two principal varieties of thefe; one found on mountains, and fuch as are met with in (wampy grounds or low lands overflown with water; both of them very heavy, and fome abforbing

water like clays. The Highland argillaceous ochres are either yellow, Highland red, brown, or greyish, indurated and friable, or loofe argillaceous and powdery, or in grains ; they are composed chiefly orcs. of the red or yellow calx of iron, or of a grey iron ore called Torflen, in a loofe form mixed with clay. Hence they often contain manganese or fiderite, and in France. are faid to be mixed with a calx of zinc. They do not obey the magnet before calcination, and rarely after it. They effervesce with acids only in consequence of being mixed with calcareous earths; they are foluble with difficulty in the acids, but the most foluble are the best. The iron produced from them is of very different quality, according to the nature of the ore from whence it is produced. To this species belong the hornstone overloaded with iron, and a white iron ore mentioned by Rinman found in Kent. It is mixed with clay or marl, and is fearcely foluble in acids. It

affords 47 per cent. of brittle iron. The fwampy argillaceous ore, according to Mr Kir-Swamps wan, are found in irregular lumps of a brown or brow- ores. nish-black, and iometimes in round balls, porous or solid, or in flat round pieces or in grains, and fometimes in slender triangular prisms parallel to each other, and very brittle. It is mixed with clay and extractive, and becomes magnetic by calcination; during which operation it gives out a quantity of aerated volatile alkali, and loses one-fourth of its weight. The crude ore affords about 36 per cent. of metal, and 50 per cent. after calcination. The iron produced from it, at least in Sweden, is that called coldsbort. According to Mr Hialm some forts of this ore contain 28 per cent. of manganefe.

12. Red calcareous iron ore is found loofe in many Red calcaparts of England, effervefces ftrongly with acids, and is roots ore. used as a paint under the name of red ochre.

13. Martial salamine. Though calamine is proper- Martial caly an ore of zinc, it fometimes contains fuch a large lamine. proportion of iron as to make it worth while to extract the iron. The ore confifts of a mixture of quartz and clay, with the calces of iron and zinc. It is of a moderate hardness, and a yellow, red, or brown colour.

14. Martial pyrites. This has its name from its Martial property of giving fire with fleel. It is commonly in pyrites.

fmall red maffes, fometimes regularly formed, and turally with the phosphoric acid. The muddy or bog from usually cubical, fpherical, or dodecahedral, though their form varies confiderably. Some are brown on the outfide, others of the colour of iron, fome vellowish, and refembling the ores of copper, even on their furface; but all of them are yellow, and as it were coppery within, and for the most part composed of needles, or pyramids of feveral fides, whose fummits converge to a common centre. The pyrites are commonly disperfed, and particularly in copper mines in the neighbourhood of iron mines, and in clays and coal mines, the upper firstum of the latter being almost always pyritous. They are all eafily decomposed, and yield green vitriol, as is explained under the article CHEMISTRY.

20 Arfenical ere, mil. pickel, or

15. Iron mineralized by arfenic. This combination takes place either by the combination of arfenic alone with the metal, or in conjunction with fulphur. The former is called in Germany mispickel, and speis by the Bohemians; is of a bright white colour, fometimes, though rarely, variegated like a pigeon's neck, and is not eafily altered by exposure to the air. It is not magnetic either before or after calcination; it is foluble in acids, and affords arfenic by distillation in the proportion of 30 or 40 per cent. and sometimes contains a small proportion of copper and silver. It is frequently found in indurated clay, quartz, spar, schoerl, &c. and mixed with other metallic ores. When this metal contains lefs than to the of arfenic, it is magnetic, according to Scheffer; whence, if the calcination be pushed to a sufficient length, the ore must remain magnetic.

White. grey, &c. marcalite.

That species of ore which consists of iron mineralized by fulphur and arfenic together, contains the white, grey or bluish grey pyrites or marcasite. It is found either in folid compact maffes of a moderate fize, or in grains, and gives fire with steel. When burnt it affords a blue flame and the fmell of arfenic, with orniment or realgar, instead of pure arienic by distillation in close veffels. It is not magnetic either before or after calcination, and contains much more arfenic than fulphur.

22 Native Pruffian blue

16. Native Pruffian blue confifts of clay mixed with iron, and coloured with fome unknown tinging fubflance, generally found in fwampy grounds or bogs. It is at first white, but when exposed to the air becomes either of a light or deep blue. By heat it turns greenish, and emits a slight flame, becoming afterward red and magnetic. It is foluble both in alkalies and acids; but the alkaline folution is precipitated by acids, and the acid folution by alkalies. The precipitate at first is greenish, and gradually assumes a white hue, but regains its blue colour on being mixed with vegetable aftringents. Mr Woulfe found this kind of ore in Scotland on the furface of the earth. The greatest part of marthy grounds containing turf, likewife have fome of

Terra ver-Verona,

24

17. The terre verte, or green earth of Verona and te, or green Normandy, is used as a pigment, and contains iron in fome unknown tlate, mixed with clay, and fometimes with chalk and pyrites; alum and felenite being likewife accidentally mixed with it. It is foluble with difficulty in acids, is not magnetic before calcination, and

fron mine- becomes of a coffee-colour by heat. 18. Mr Fourcroy informs us, that " it has been ralized by phosphoric discovered some years ago, that iron is often united naacid.

ores are fometimes of this nature; a portion of this compound remaining in the iron gives it the property of being brittle when cold. Iron in this flate was called fiderite by Bergman, and it has tince been called water-iren.

There are several other kinds of iron ore enumerated by mineralogists: but those already mentioned are the

most remarkable. The following observations on iron in its different flates, with an account of the methods of manufactuing it, &c. are extracted from Magellan's Notes on Cronftedt's Mineralogy.

1. Iron is employed in three different states, each having its peculiar properties, by which they are each more particularly applicable to various purpofes. The first is cast iron, the second is wrought or malleable iron,

and the third is called Reel.

According to Bergman, cast iron, which may be called unripe or raw-iron, contains the smallest share of phlogiston. The malleable iron contains the greatest quantity; and the feel a middling share between both, neither fo much as the malleable, nor fo little as the cast-iron. This last is called also pig iron, and yetlin in England.

2. The richest ores of iron are the compact and ponderous, of a brownish, reddish-brown, or red colour. Some of these ores, in colour and appearance, do not ill resemble iron itself; as the grey ores of Derbyshire, and the bluish of the Forest of Dean in Gloucestershire. Most of the Swedish ores are likewise of this kind. Others are blackish, brown, red, vellowish, or rufty-coloured: these are the most common in England and Germany. There is one very fingular species of a firiated texture, and of a pale yellowish or greyish colour, oftentimes white, and in some degree pellucid; which, although in its crude flate, promifes nothing metallic, nevertheless, on being moderately calcined, discovers, by the deep colour it assumes, that it abounds in iron. Cramer informs us, that it gives out by fusion from 30 to 60 per cent. But some richer ores yield no less than 70 and 80 on the hundred.

3. Different kinds of iron ore are found adhering in some mines to the tops of caverns in form of icicles or firize, fometimes irregularly cluftered together, fometimes hanging down like the briftles of a brush ; from whence the name of brush-iron-ore. Other particular forms of the iron stone have occasioned a variety of fanciful names, that are met with in some of the me-

tallurgic writers.

4. The iron of Great Britain is made from three different kinds of ores: 1. From the iron-ore called the Lancasbire ore, from the country where it is found in greatest abundance. This ore is very heavy, of a fibrous or lamellated texture; it is of a dark purple, approaching to a fhining black; and when reduced to powder, it becomes of a deep red : it lies in veins like the ores of other metals. 2. The bog-ore, which refembles a deep yellow ochry clay, and feems to be the deposition of some ferruginaceous rivulets, whose currents had formerly been over the furface of those flat marshy plains. It lies in beds of irregular thickness, commonly from 12 to 20 inches, and very various in their breadths from fide to fide, never being of great dimensions. 3. The iron-stones, however, have no remetal in their external furface. They lie often in beds of great extent, like other ftony matters, and are fometimes stratified with seams of pit-coal, forming alternate

5. The ores of iron are commonly calcined previous to the fusion, even the harder ones, though they should contain nothing fulphureous or arfenical, in order to calcine the hard adhering matrices, and render the masses soft enough to be easily broken into fragments of a convenient fize for melting. After the mineral is duly prepared, it must be fmelted in furnaces of large capacities, from 16 to 25 feet high, and from 10 to 14 wide: the most approved shape nearly refembles that of a hen's egg, with the largest end undermost, below which is a square cavity to contain the melted metal, and at the top a very short vent about 20 inches in diameter. The inner wall is built of fireflone, which endures very frong heat with little rifk of melting, and all the joints are cemented with mortar composed of fand and clay. This is furrounded with more building, which deviates more and more from a circular form, and becomes a fourre building of about 20 feet at the bafe, and gradually converges to

6. Near the bottom is an aperture, for the infertion of the pipe of a large bellows, worked by water or by other machines that may produce a ftrong current of air. Some very powerful ones, as those in the iron works at Colebrook-dale and at Carron, confift of two or more iron cylinders, about upwards of two feet wide, whose piftons are alternately moved by a fmall fire engine or by a water wheel: but Mr Wilkinfon very ingeniously adapted to his own a large vaulted receiver furrounded by water, which produces a very regular and uniform blaft. Two or more holes are also left ready to be occasionally opened at the bottom of the furnace, to permit at a proper time the fcoria and the metal to flow out, as the process may require. Charcoal, or coke with lighted brushwood, is first thrown in; and when the inside of the furnace has acquired a ftrong ignition, the ore is thrown in by fmall quantities at a time, with more of the fuel; and commonly a portion of lime-stone is thrown also as a flux. The ore gradually fubfides into the hottest part of the furnace, where it becomes fused; and the metallic parts being revived by the coal, pass through the fcoria, and fall to the lower part or bottom of the furnace, where a passage is open for taking off the scum or drofs. The metal now in strong fusion is let out by a tap-hole into furrows made in a bed of fand : the large mass, which sets in the main furrow, is called by the workmen a fow, and the leffer ones pigs of iron. Chimney-backs, stoves, garden-rollers, &c. are formed of this rough metal, taken out of the receiver with ladles, and cast into moulds made of fine fand."

It is proper to observe, that the excessive and longcontinued ignition kept up in these furnaces gradually wastes the materials of which they are composed, rendering their fides thinner until at last they become unable to fustain the weight of the melted metal; fo that it has fometimes been known to burst out fuddenly in a violent and most destructive stream. At certain in-

7. The quantity of fuel, the additions, and the heat, must be regulated, in order to obtain iron of good quality; and this quality must likewife in the first product be necessarily different, according to the nature

of the parts that compose the ore.

8. Two or three tons, viz. 4000 or 6000 pounds weight of iron, are now run off in 24 hours, at fome large furnaces, after the application of the large bellows; whilft fearcely an hundred weight could be obtained in a day before that application, because a large quantity of the metal was left in the drofs; hence in fome places the flags of different ores, left by old operators in former times, are now remelted to advantage along with fresh ore; and on account of the richness of these old slags of different ores, fome people have been missed into the opinion, that the metal was regenerated in them.

9. Peat and turf has been found to answer tolerably well, mixed with charcoal, for the fmelting of iron ores; but an attempt to use it on a large scale has at last been found not to answer the expectations that had been conceived from the first trials. Pit-coal, if applied to the fame purpofe, renders the iron hard and brittle; but this inconvenience is prevented, by previously coaking the coal, and employing it in the state of true coak. Cramer, in his Art of Affaying, p. 347. fays, that pit-coals, kennel-coals, and Scotchcoals, which burn to a white ash like wood, and abound more in bitumen, may be ufed in the first fluxion of the iron from its ore; and if the iron proves not fo malleable as required, this property may be given to it by melting the metal a fecond time with wood

10. The best cast iron or raw-iron, as much freed from heterogeneous matters as the ufual proceis of fmelting can effect it, is not at all malleable, and fo

hard as perfectly to withstand the file.

11. In general the impure cast-iron, as run from the ore, is melted down a fecond time in another furnace, intermixed with charcoal A ftrong blaft of air being impelled on the furface of the metal, its fusion is remarkably promoted; the iron thickens into a mass called a loop, which is conveyed under a large hammer raifed by the motion of a water-wheel. The iron is there beaten into a thick fquare form, is then heated again until almost ready to melt, and is forged; by a few repetitions of this process, it becomes completely malleable, and is at length formed into bars for

12. Iron in this state of malleability is much fofter than before, and of a fibrous texture. But if it is still crude and brittle after the above process, it shows that there have remained heterogeneous matters, being hidden in its interflices, which must be expelled; for this purpose the iron must be stratified withcharcoal-dust within a proper furnase, heaped up in good quantity in strata; then the fire must be blown pretty strongly, fo as to bring it to a fufion, which is to be helped by the addition of fufible fcorias or of fand. The fire must not be much greater than necessary to make all thefe melt as equally as possible; to obtain this end, the melted mass must be agitated here and there with tervals, therefore, the fire ought to be allowed to go poking rods of wrought iron, in order to make every

part feel alike the action of the fire and air; and the increasing feorias taken out once or twice.

13. In the mean time, a great many sparkles will be thrown out from the iron, which diminish the more as the iron comes nearer to the defired degree of purity, but they never ceafe entirely. The burning coals being then removed, and the scoria conveyed out of the fire through a channel made for that purpose, the iron, by lessening the violence of the fire, grows folid, and must be taken out red-hot, and tried by striking it with a hammer. If it proves crude still, let the melting be repeated; and when it is at last sufficiently purified, it is to be hammered, and extended various ways, by making it red-hot many times over; this done, it will no longer be brittle, even when cold, as Cramer afferts.

14. Cast-iron has of late been brought into the malleable flate by paffing it through rollers inflead of forging it. Indeed this feems to be a real improvement in the process, as well in point of dispatch, as in its not requiring that skill and dexterity which forgemen only acquire by long practice. If the purposes of commerce should require more iron to be made, it will be easy to fabricate and erect rolling machines, though it might be impracticable to procure expert

forgemen in a short time.

13. This method was discovered by Henry Cort of Gosport, who obtained an exclusive privilege granted by the king's patent. By this process the raw or cast iron is freed from the impurities, which are not discharged in the common methods of rendering this metal malleable; for iron is in itself a simple homogeneous metal; and all iron must become equally good, if it be purified from the heterogeneous and unmetallic

particles that are any ways mixed with it.

16. The ordinary method of converting cast iron into malleable, is, as we have feen, by employing great quantities of charcoal, which furnishes phlogiston, and remetallizes the particles, which are unmetallized and mixed with the heterogeneous matters contained in the fused mass: but in Cort's method there is no need of charcoal, instead of which only fea-coal is employed; because the object is not to remetallize, but only to expel what is unmetallic, instead of endeavouring to restore the calcined parts with charcoal at a great expence, and still leaving the business undone. In this method the iron is only heated and wrought fimply by the heat of the flame, initead of being mixed with the burning fuel and ashes, which are not easily difengaged afterwards from the metal. The fqueezing it between the rollers, forces out the melted flags from the metallic pores, and brings its metallic fibres into a perfect folidity and elofe contact, fo that they are obliged to cohere much more perfectly to each other, than by the interrupted and partial action of the ham. mer. By the operation of being long stirred, the fulphureous particles are more disposed to be disengaged, and are burned away in the form of blue sparks; the metal then begins to curdle, and to lofe its fufibility, like folder when it just begins to fettle; the metallic particles meeting and coalescing together, much like the churning of milk, where the cream is separated by cheefe. The curdles formed into a connected mass with thin lute.

become what is called loops. The process is as follows:

17. Five or fix hundred weight of raw cast-iron (and even of cold short iron) is brought into a low fusion, on a kind of hearth or low furnace, in which it lies to the depth of about 6 inches. One or two workmen continually ftir this fufed mass with long iron pokers for about 4 or 5 hours. The heat is then lowered: the men fashion the iron into narrow pieces of about 31 feet long, and 3 inches fquare, with long knives or chiffels made for that purpofe. They are then heated to the welding degree, and hammered to expel and fcatter the unmetallic drofs. Thefe flabs are then formed to a wedge-point at one end, in order to adapt them to be received between the rollers: they are malleable already, but they contain fill fome

18. They are then heated again to the hottest welding heat in the air furnace: and immediately paffed through large iron-rollers, turned by a water-wheel or by horses. If the end prefented to the rollers should flip inftead of entering, a boy, who flands ready, throws some fand upon the iron, and it goes in easily. Much foreign and heterogeneous matter is fqueezed out by the rollers; and the iron comes out in a purer malleable flate. The fame heat will ferve to pass the iron through two fets of rollers, which are grooved for as to fashion it into nail-rods or other forms according

to the required purpofes.

19. Various and repeated fevere trials have been made in the royal dock-yards of England, in the prefence of persons of knowledge and rank, to prove the ftrength, malleability, and foftness or toughness of this new iron; and it has proved to be equal, and even fometimes superior, to the best Swedish iron. But it is not eafy to conceive by what fingular fatality fo great an improvement in manufacturing this most useful metal has not yet been generally adopted by the iron-masters.

20. Steel is iron in an intermediate state between cast iron and malleable iron, which is foft and tough. The iron run from fome German ores is found to be a good feel when forged only to a certain point.

But the best steel is usually made by cementation from the best forged iron, with matters chiefly of the inflammable kind. Two parts of pounded charcoal and one of wood ashes is esteemed a good cement; The charcoal dust may be made of bones, horns, leather, and hairs of animals, or of any of these ingredients after they are burned in a close veffel till they are black: thefe being pulverized, and mixed with wood-ashes, must be well mixed together. The iron should be of pure metal, not over thick, and quite free from heterogeneous matters: their flexibility, both when hot and when cold, is a very good fign thereof. A deep crucible, two or three inches higher than the bars, is to receive part of the cement, well preffed at the bottom, the height of It inch; and the bars are to be placed perpendicularly, about one inch diftant from the fides of the veffel and from each other. All the interffices are to be filled with the fame cement, and the whole covered to the top with it; then a the union formed between the fibrous particles of the tile is applied to cover the veffel, flopping the joints Tron.

21. The crucible is then to be put in the fur- fteel is hotter and the water colder. Hence arifes the nace, and a firong fire is to be made, that it be kept moderately red hot for fix or ten hours together; at the end of which time they will be found converted into steel. If the cementation be continued too long, the fteel will become excessively brittle, incapable of being welded, and apt to crack and fly in forging. On the contrary, fleel cemented with abforbent earths is reduced to the flate of forged iron.

22 Steel is further purified for making the nicest kinds of instruments, fuch as lancets, pen-knives, razors, and various pieces, for the belt kind of watches, time-keepers, or chronometers, and aftronomical regulators. This purification of feel confifts in melting it again with a strong but regular fire in a crucible, the better to free it from the heterogeneous parts, and little flaws that may be contained in it. It is then called cast-steel when fufed into bars ; which name, however, does not imply that the pieces, for inflance the cast-steel razors, have been really cast in their prefent shape; for they must be forged from the bar after it is cast. The fusion must have been perfect, So that the metallic parts be rendered uniform. The metal diminishes a little by this process, for a bar of common fteel 36 inches long, will afterwards produce another only of 35, if properly fufed and puri-

23. The cast-steel will not bear more than a red heat; otherwife it runs away, like fand under the hammer, if the heat is pushed to the welding degree. Dr Watfon fays, that this manufacture of cast-steel was introduced at Sheffield only about 40 years ago by one Waller. This man was still living about the year 1765; he dwelt at St Bartholomew's close, and was a galloon-wire drawer by trade. The difficulty of procuring small cylinders of good steel to slatten the wire for lace-work in his business, whose defect proceeded from the bad texture of the fteel, fet his imagimation on the enquiry after a method of purifying the metal to a greater perfection; and he thought that a new fusion of it was the most likely to accomplish his views. After fome trials, he at last succeeded; but it was foon known to others, who got the advantages for themfelyes; of which ill fate the real inventor very bitterly complained till the end of his life. His own name was even forgotten, as one Huntfman practifed this art to fuch an extent, that cast steel was known under his Jole name afterwards.

24. But before this difcovery made by Waller in England, this kind of feel was made already in Germany, as Watfon afferts; and from thence fome fmall quantities were brought to England at a confiderable price. Since that time this branch of business is carried on advantageously at Sheffield; for the manufactures there furnish a great abundance of broken tools and old bits of fteel, at a penny a pound, which, after fusion and purification, fell for 10 or 12 times as much.

25. It is a valuable property of iron, after it is reduced into the flate of fleel, that though it is fufficiently foft when hot, or when gradually cooled, to be formed without difficulty into various tools and utenfils; yet it may be afterwards rendered more or less hard, even to an extreme degree, by simply plunging it, when red-hot, into cold water. This is called tempering. The hardness produced is greater in proportion as the Nº 160.

superiority of this metal for making mechanic inftruments or tools, by which all other metals, and even itself, are filed, drilled, and cut. The various degrees of hardness given to iron, depend on the quantity of ignition it possesses at the moment of being temperedwhich is manifelted by the fuccession of colours, exhibited on the furface of the metal, in the progress of its receiving the increasing heat. They are the vellowishwhite, yellow, gold-colour, purple, violet, and deepblue; after which, the complete ignition takes place, They proceed from a kind of fcorincation on the furface of the heated metal.

26. A bar of clean white fleel may be made to affume all the above colours at once, by placing one end in the fire, and keeping the other end out, which is fupposed of a proper length to remain cold.

27. Thefe colours ferve as figns to direct the artift in tempering this metal. For though ignited feel, fuddenly quenched in very cold water, proves excessively hard and brittle; yet it may be reduced to the required degree of temper by heating it till it exhibits a known colour. This is the method employed in this process by the artists. As foon as the piece of steel is completely ignited, they plunge it in a very cold water; and as foon as it loofes its fiery appearance, they take it out, rub it quickly with a file, or on a plate covered with fand, that it may have a white furface. The heat, which is still within the metal, foon begins to produce the fuccession of colours. If a hard temper is defired, as foon as the yellow tinge appears, the piece is dipped again, and flirred about in the cold water. If the purple appears before the dipping it, the temper will be fit for tools employed in working upon metals; if dipped while blue, it will be proper for fprings, and for other instruments fit to cut all forts of foft fubstances; but if the last pale colour be waited for, the steel will not be hard at all.

28. It deferves notice, that a piece of iron is rendered confiderably warm by hammering, fo as even to become red hot. But after the iron has been completely hammered once, it is afferted that it cannot be rendered again red hot by the same operation, because no further compression can then be made. Hard steel is the only metal that, being flruck flantwife with the tharp edge of a flint, or of another hard flone, produces fparks of fire.

29. Iron is often manufactured fo as to be 150 times, and even above 630 times, more valuable than gold. On weighing fome common watch pendulum-springs at Mr Tho. Wright's, watch-maker to the king, fuch as are fold at half a crown by the London artifts for common work, ten of them weighed but one fingle grain. Hence one pound avoirdupois (= 7000 gr.) contains ten times as many of thefe fprings; which, at half a crown a-piece, amount to 8750 l. Sterling. The troy ounce of gold fells at 4 l. Sterling, and the pound (= 5760 gr.) at 48 l. Sterling, which gives 58,33 (or 58 l. 6 s. 7 d.) for each pound avoirdupois of gold: and of course \$750 = 150. But the pendulum springs of the best kind of watches fell at half a guinea each; and at this rate the abovementioned value must be increased in the ratio of s. to 4.2; viz. of half a crown to half a guinea: which will amount to 36,750 l. Sterling; and this fum divided

Iron. by the value of this pound of gold, gives above 630 to

Under the article ELECTRICITY, we have taken notice of a curious experiment of burning iron in dephlogisticated air; of which an account is also given under AEROLOGY, where the experiments of Dr Prieftley are related. In the last number of the Chemical Annals we find the fubiest particularly treated of by M. Lavoisier. " The beautiful experiment of Mr Ingenhoufz (favs he) is now well known. A piece of very fine iron wire is turned into a foiral form ; one end of it is fixed in a bottle cork ; to the other a piece of agaric is fastened: when this has been done, a bottle is filled with vital air; the agaric is lighted, and it is then, along with the iron wire, quickly introduced into the bottle, which is stopped with the cork. As foon as the agaric is plunged into the vital air, it begins to burn with a dazzling light; the inflammation is communicated to the iron, which also burns, throwing off bright sparks that fall to the bottom of the bottle in round globules. These globules become black as they cool, and preserve some remains of their metallic lustre. The iron thus burnt is more brittle than glass itself; it powders easily; is attractable by the magnet, but less fo than before the operation."

M. Lavoisier, in order to observe more fully the changes which happened to the metal on this occasion, repeated the experiment upon a fcale confiderably larger. He immerfed chips of iron turned into a spiral form into a veffel filled with pure air which contained about 12 quarts; fixing to the end of each chip a finall bit of agaric, and a particle of phosphorus weighing fcarce to the of a grain. Having fet fire to the phofphorus and agaric, the iron is wholly confumed to the very last particle with a bright white light refembling flars in rockets. The heat in this combustion melts the iron, which falls down in globules of different fizes. In the first instant of the combustion there is a slight dilatation of the air; but this is fucceeded by a very rapid diminution; and when the quantity of iron is fufficient, and the air very pure, almost the whole gas is abforbed. Our author recommends only fmall quantities of iron to be burnt at a time; because the heat produced by its combustion is so great, that the glass is apt to fly. A dram, or a dram and an half, is fufficient for a jar holding four gallons, which ought to be very strong in order to resist the weight of the mercury with which it is to be filled. The increase of weight in the iron, by being burnt in this manner, is, according to our author, about 35 per cent. It is then in a flate of ethiops, and may be powdered in a mortar. When the air in which the combustion has been performed is very pure, there is no great difference betwixt that in which the iron has been burnt and the original quantity, excepting only a fmall mixture of fixed air from the little portion of charcoal contained in the iron.

In this work also we find some observations on the folubility of iron in pure water from Crell's Annals for the year 1788. It has generally been supposed that pure water is incapable of dissolving or holding iron in folution: but the fact feems now to be etablished by the following experiment. A pound of fresh distilled water was poured upon two ounces of iron-filings into parrow-necked glass retort; the vessel was then put

Vol. IX. Part I.

in a fac mothes, and the liquid evaporated to one half; after which the mouth was flightly flooped with a cork, and the matter left to digeff in a gentle heat. On opening the veffel it was found that the water had become flyptic, and had a ferruginous tafle; whence it appeared that part of the metal was diffolved. Phlogiflicated alkali had no effect upon this folution until a few drops of pure diffilled acetous acid were added, when a little Pruffian blue fell to the bottom. Soon after making this experiment, our author met with a natural mineral water which contained iron in folution, though it would not precipitate any thing until a few drops of acid were added. This folubility of iron in pure water has been also taken notice of by M. Landriani and M. Monnet.

Iron is eafily calcinable by fire, and is foluble in all How to the acids, even that of fixed air. By exposure to the preserve atmosphere it is attacked by the pure part of the fur-rusting. rounding fluid, which thus becomes converted into fixed air, the metal in the mean time being changed into a yellowish brown powder called rust. Common iron is much more subject to rust than steel; and this facility of calcination renders it a matter of great importance to discover some effectual method of preventing it from taking place. Various compositions have been recommended, but none have been found more effectual than common oil. As the use of this, however, must be on many occations troublefome and difagreeable, a still more commodious method has been fallen upon. It is known that the metal, after having undergone that kind of calcination in which it combines with the bafe of dephlogisticated air, or begins to combine with it, is not subject to rust. By giving it a coating of this kind, therefore, it is effectually preserved from any action of the air; and this is done by heating it till it affumes a blue colour, which indicates a partial calcination on the outfide : and thus utenfils are made capable of being preserved from rult for a long time; though even these, when exposed wet, or even a long time to the atmosphere, will be covered with ruft and decay like others. For the chemical properties of iron, fee CHE-MISTRY; for its electrical and magnetical ones, fee E-LECTRICITY and MAGNETISM.

Ison-Moulds, and spots of ink in linen, may be taken out by dipping the stained part in water, sprinkling it with a little of the powdered effential salt of woodforrel, then rubbing on a pewter plate, and washing the spot out with warm water.

TRON-Sick, in the fea-language, is faid of a fhip or boat, when her bolts or nails are fo eaten with ruft, and fo worn away, that they occasion hollows in the planks, whereby the vessel is rendered leaky.

IRON-Wood, in botany. See the article SIDEROXY-

IRONY, in botany. See the article Siderits.

IRONY, in rhetoric, is when a person speaks contrary to his thoughts, in order to add force to his discourse; whence Quintilian calls it diversity discourse.

Thus, when a notorious villain is fcornfully complimented with the titles of a very honeft and excellent perfon; the character of the perfon commended, the air of contempt that appears in the speaker, and the exorbitancy of the commendations, sufficiently discover the diffinulation of irony.

Ironical exhortation is a very agreeable kind of trope;
Y y which,

Iron, Irony.

Troquois which, after having fet the inconveniences of a thing britability, in the clearest light, concludes with a feigned encouragement to pursue it. Such is that of Horace, when, having beautifully described the noise and tumults of Rome, he adds ironically,

" Go now, and study tuneful verse at Rome!"

IROOUOIS, the name of five nations in North America, in alliance with the British colonies. They are bounded by Canada on the north, by the British plantations of New York and Pennfylvania on the east and fouth, and by the lake Ontario on the west.

IRRADIATION, the act of emitting fubtile effluvia, like the rays of the fun, every way. See Efflu-

IRREGULAR, fomething that deviates from the common forms or rules: thus, we fay an irregular fortification, an irregular building, an irregular figure.

IRREGULAR, in grammar, fuch inflections of words as vary from the general rules; thus we fay, irregular

nouns, irregular verbs, &c.

The diffinction of irregular nouns, according to Mr Ruddiman, is into three kinds, viz. variable, defective, and abundant; and that of irregular verbs into anoma-

lous, defective, and abundant. IRRITABILITY, in anatomy and medicine, a term first invented by Gliffon, and adopted by Dr Haller to denote an effential property of all animal bodies; and which, he fays, exists independently of and in contradiftinction to fentibility. This ingenious author calls that part of the human body irritable, which becomes shorter upon being touched; very irritable, if it contracts upon a flight touch; and the contrary, if by a violent touch it contracts but little. He calls that a fensible part of the human body, which upon being touched transmits the impression of it to the soul; and in brutes, he calls those parts fensible, the irritation of which occasions evident figns of pain and disquiet in the animal. On the contrary, he calls that infenfible, which being burnt, tore, pricked, or cut till it is quite destroyed, occasions no fign of pain nor convulsion, nor any fort of change in the fituation of the body. From the refult of many cruel experiments he concludes, that the epidermis is infensible; that the skin is fensible in a greater degree than any other part of the body; that the fat and cellular membrane are infensible; and the muscular flesh sensible, the sensibility of which he ascribes rather to the nerves than to the flesh itself. The tendons, he fays, having no nerves distributed to them, are insensible. The ligaments and capfulæ of the articulations are also concluded to be infensible; whence Dr Haller infers, that the sharp pains of the gout are not seated in the capfulæ of the joint, but in the fkin, and in the nerves which creep upon its external furface. The bones are all insensible, fays Dr Haller, except the teeth; and likewife the marrow. Under his experiments the periofleum and pericranium, the dura and pia mater, appeared infentible; and he infers, that the fentibility of the nerves is owing to the medulla, and not to the membranes. The arteries and veins are held susceptible of little or no fenfation, except the carotid, the lingual, temporal, pharyngal, labial, thyroidal, and the aorta near the heart; the fensibility of which is ascribed to the nerves that accompany them. Senfibility is allowed to the internal membranes of the stomach, intestines, bladder, ureters, vagina, and womb, on account of

their being of the same nature with the skin : the heart Irritability. is also admitted to be sensible: but the lungs, liver, irrogation fpleen, and kidneys, are possessed of a very imperfect, if any, fenfation. The glands, having few nerves, are endowed with only an obtuse sensation. Some sensibility is allowed to the tunica choroidis and the iris, tho' in a less degree than the retina; but none to the cornea. Dr Haller concludes, in general, that the nerves alone are fenfible of themfelves; and that, in proportion to the number of nerves apparently distributed to particular parts, fuch parts possess a greater or less degree of fenfibility.

Irritability, he fays, is fo different from fenfibility, that the most irritable parts are not at all fensible, and vice verfa. He alleges facts to prove this position, and also to demonstrate, that irritability does not depend upon the nerves, which are not irritable, but upon the original formation of the parts which are susceptible of Irritability, he fays, is not proportioned to fenfibility; in proof of which, he observes, that the inteftines, though rather less sensible than the stomach, are more irritable; and that the heart is very irritable, though it has but a small degree of sensation.

Irritability, according to Dr Haller, is the diftinruishing characteristic between the muscular and cellular fibres; whence he determines the ligaments, periofleum, meninges of the brain, and all the membranes composed of the cellular substance, to be void of irritability. The tendons are unirritable; and though he does not absolutely deny irritability to the arteries, yet his experiments on the aorta produced no contraction. The veins and excretory ducts are in a small degree irritable, and the gall-bladder, the ductus chole-dochus, the ureters and urethra, are only affected by a very acrid corrofive; but the lacteal veffels are confiderably irritable. The glands and mucous finuses, the uterus in quadrupeds, the human matrix, and the genitals, are all irritable; as are also the muscles, particularly the diaphragm. The cofophagus, stomach, and intestines, are irritable: but of all the animal organs the heart is endued with the greatest irritability. In general, there is nothing irritable in the animal body but the mufcular fibres; and the vital parts are the most irritable. This power of motion, arifing from irritations, is supposed to be different from all other properties of bodies, and probably refides in the glutinous mucus of the mufcular fibres, altogether independent of the influence of the foul. The irritability of the muscles is said to be destroyed by drying of the fibres, congealing of the fat, and more especially by the use of opium in living animals. The physiological system, of which an abstract has been now given, has been adopted and confirmed by Castell and Zimmermann, and also by Dr Brocklefby, who fuggefts, that irritability, as diftinguished from fensibility, may depend upon a feries of nerves different from fuch as ferve either for voluntary motion or fensation. This doctrine, however, has been controverted by M. le Cat, and particularly by Dr Whytt in his Physiological Essays. See also ANATOMY, nº 86, et feq. and nº 136.

IRROGATIO, a law term amongst the Romans, fignifying the inftrument in which were put down the punishments which the law provided against such offences as any person was accused of by a magistrate before the people. These punishments were first proclaimed viva voce by the accuser, and this was called Inquisitio :

Irromango The fame, being immediately after expressed in writing, took the name of Rogatio, in respect of the people, who were to be confulted or asked about it, and was called Irrogatio in respect of the criminal, as it imported the mulct or punishment assigned him by the ac-

> IRROMANGO, or ERRAMONGO, one of the New Hebrides islands, is about 24 or 25 leagues in circuit : the middle of it lies in E. Long. 169. 19. S. Lat. 18. 54. The inhabitants are of the middle fize, and have a good shape and tolerable features. Their colour is very dark; and they paint their faces, some with black, and others with red pigment: their hair is curly and crifp, and fomewhat woolly. Few women were feen, and those very ugly: they wore a petticoat made of the leaves of some plant. The men were quite naked, excepting a belt tied about the waift, and a piece of cloth, or a leaf, used for a wrapper. No canoes were feen in any part of the island. They live in houses covered with thatch; and their plantations are laid out by line, and fenced round. An unlucky scuffle between the British failors and these people, in which four of the latter were desperately wounded, prevented captain Cook from being able to give any particular information concerning the produce, &c. of this island.

IRTIS, a large river of Afia, in Siberia, which rifes among the hills of the country of the Kalmucks, and, running north-east, falls into the Oby near Tobolik. It abounds with fish, particularly sturgeon,

and delicate falmon.

IRVINE, a fea-port and parliament town of Scotland. in the bailiewick of Cunningham; feated at the mouth of a river of the same name on the frith of Clyde, in W. Long. 2. 55. N. Lat. 55. 36. This port had formerly feveral buffes in the herring-fishery. At present that branch is given up; but the inhabitants still employ a number of brigs in the coal-trade to Ireland. Irvine had a vifcount's title, now extinct.

ISAAC, the Jewish patriarch, and example of fi-

lial obedience, died 1716 B. C. aged 180.

ISÆUS, a Greek orator, born at Colchis, in Syria, was the disciple of Lysias, and the master of Demoshenes; and taught eloquence at Athens, about 344 years B. C. Sixty-four orations are attributed to him; but he composed no more than 50, of which only 10 are now remaining. He took Lysias for his model, and fo well imitated his style and elegance, that we might eafily confound the one with the other, were it not for the figures which Ifæus first introduced into frequent use. He was also the first who applied eloquence to politics, in which he was followed by his disciple Demosthenes.

He ought not to be confounded with Ifæus, another celebrated orator, who lived at Rome in the time

of Pliny the Younger, about the year 97.

ISAIAH, or the Prophefy of ISAIAH, a canonical book of the Old Testament. Isaiah is the first of the four greater prophets; the other three being Jeremiah, Ezekiel, and Daniel. This prophet was of royal blood, his father Amos being brother to Azariah king of Judah. The five first chapters of his prophecy relate to the reign of Uzziah; the vision in the fixth chapter happened in the time of Jotham: the next

der the reigns of Hezekiah and Manasseh, are related Isatis. in the next chapters to the end. Isaiah foretold the deliverance of the Jews from their captivity in Babylon by Cyrus, one hundred years before it came to pals. But the most remarkable of his predictions are those concerning the Messiah, which describe not only his descent, but all the remarkable circumstances of his life and death. The ftyle of this prophet is noble, neryous, fublime, and florid, which he acquired by converse with men of the greatest abilities and elocution: Grotius calls him the Demosthenes of the Hebrews. However, the profoundness of his thoughts, the loftiness of his expressions, and the extent of his prophecy, render him one of the most difficult of all the prophets; and the commentaries that have been hitherto written on his prophecy fall short of a full explication of it. Bishop Lowth's new translation, &c. published in 1778, throws confiderable light on the composition and meaning of Isaiah.

ISATIS, WOAD: A genus of the filiquofa order, belonging to the tetradynamia class of plants; and in the natural method ranking under the 30th order, the Siliquofa. The filiqua is lanceolated, unilocular, monospermous, bivalved, and deciduous: the valves navicular or canoe-shaped. There are four species; but the only one worthy of notice is the tinctoria, or common woad, which is cultivated in feveral parts of Britain for the purposes of dyeing; being used as a foundation for many of the dark colours. See COLOUR-

Making, no 37; and WOAD.

The plant is biennial; the lower leaves are of an oblong oval figure, and pretty thick confiftence, ending in obtuse roundish points; they are entire on their edges, and of a lucid green. The stalks rife four feet high, dividing into feveral branches, garnished with arrowshaped leaves sitting close to the stalks; the branches are terminated by fmall yellow flowers, in very close clusters, which are composed of four small petals, placed in form of a crofs, which are succeeded by pods shaped like a bird's tongue, which, when ripe, turn black, and open with two valves, having one cell, in

which is fituated a fingle feed.

This fort is fown upon fresh land which is in good heart, for which the cultivators of woad pay a large rent. They generally choose to have their lands situated near great towns, where there is plenty of dreffing ; but they never flay long on the fame fpot: for the best ground will not admit of being fown with woad more than twice; and if it is oftener repeated, the crop feldom pays the charges of culture, &c. Thofe who cultivate this commodity have gangs of people who have been bred to the employment; fo that whole families travel about from place to place wherever their principal fixes on land for the purpose. As the goodness of woad consists in the size and fatness or thickness of the leaves, the only method to obtain this, is by fowing the feed upon ground at a proper feafon, and allowing the plants proper room to grow; as also to keep them clean from weeds, which, if permitted to grow, will rob the plants of their nourishment. After having made choice of a proper fpot of land, which fhould not be too light and fandy, nor over stiff and moift, but rather a gentle hazel loam, whose parts chapters, to the fifteenth, include his prophecies un- will eafily separate, the next is to plough this up just der the reign of Ahaz; and those that were made un- before winter, laying it in narrow high ridges, that the frost may penetrate through the ridges to mellow and foften the clods; then in the fpring plough it heart, it will require dreffing before it is fown, in again croffwife, laying it again in narrow ridges. After it has lain for fome time in this manner, and the but this should not be laid on till the last ploughing. weeds begin to grow, it should be well harrowed to destroy them: this should be repeated twice while the land is ploughed, that the fun may not exhale the weeds are young; and, if there are any roots of large perennial weeds, they must be harrowed out, and carried off the ground. In June the ground should be a third time ploughed, when the furrows should be natrow, and the ground flirred as deep as the plough will go, that the parts may be as well feparated as possible; and when the weeds appear again, the ground should be well harrowed to destroy them. Toward the end of July, or the beginning of August, it should be ploughed the last time, when the land should be laid smooth; and when there is a prospect of showers, the ground must be harrowed to receive the feeds, which should be fown in rows with the drill plough, or in broad-cast after the common method; but it will be proper to fleep the feeds one night in water before they are fown, which will prepare them for vegetation : if the feeds are fown in drills, they will be covered with an infrument fixed to the plough for that purpose, but those which are fown broad-cast in the common way must be well harrowed in. If the feeds are good, and the feafon favourable, the plants will appear in a fortnight, and in a month or five weeks will be fit to hoe; for the fooner this is performed when the plants are diffinguishable, the better they will thrive, and the weeds being then young will be foon destroyed. The method of hocing these plants is the same as for turnips: with this difference only, that these plants need not be thinned so much; for at the first hoeing, if they are separated to the distance of four inches, and at the last to fix inches, it will be fpace enough for the growth of the plants; and if this is carefully performed, and in dry weather, most of the weeds will be deftroyed; but as fome of them may escape in this operation, and young weeds will rife, so the ground should be a second time hoed in the beginning of October, always choosing a dry time for this work; at this fecond operation, the plants should be fingled out to the diffance they are to remain. After this, if carefully performed, the ground will be clean from weeds till the fpring, when young weeds will come up: therefore about the middle of March will be a good time to hoe the ground again; for while the weeds are young, it may be performed in less than half the time it would require if the weeds were permitted to grow large, and the fun and wind will much fooner kill them : this boeing will also ftir the furface of the ground, and greatly promote the growth of the plants ; if this is performed in dry weather, the ground will be clean till the first crop of woad is gathered, after which it must be again well cleaned; if this is carefully repeated after the gathering each crop, the land will always lie clean, and the plants will thrive the better. The expence of the first hoeing will be about fix shillings per acre, and for the after hoeings half that price will be fufficient, prowided they are performed when the weeds are young, for if they are suffered to grow large, it will require more labour, nor can it be to well performed.

been in culture before for other crops, fo not in good which case rotten stable-dung is preferable to any other; just before the feeds are fown, and not foread till the goodness of it, which in summer is soon lost when spread on the ground. The quantity should not be less than 20 loads to each acre, which will keep the ground in heart till the crop of woad is frent.

The time for gathering of the crop is according to the feason: but it should be performed as soon as the leaves are fully grown, while they are perfectly green ; for when they begin to change pale, great part of their goodness is over, for the quantity will be less,

and the quality greatly diminished.

If the land is good, and the crop well hufbanded, it will produce three or four gatherings; but the two first are the best. These are commonly mixed together in the manufacturing of it : but the after crops are always kept separate; for if these are mixed with the other, the whole will be of little value. The twofirst crops will sell from 25 l. to 30 l. a ton; but the latter will not bring more than 71, or 81, and fometimes not so much. An acre of land will produce a ton of wood, and in good feafons near a ton and an half.

When the planters intend to fave the feeds, they cut three crops of the leaves, and then let the plants fland till the next year for feed; but if only one crop is cut, and that only of the outer leaves, letting all the middle leaves fland to nourish the flalks, the plants will grow ftronger, and produce a much greater quan-

tity of feeds.

These feeds are often kept two years, but it is always best to fow new feeds when they can be obtained. The feeds ripen in August; and when the pods turn to a dark colour, the feeds should be gathered. It is best done by reaping the stalks in the fame manner as wheat, fpreading the stalks in rows upon the greand: and in four or five days the feeds will be fit to thresh out. provided the weather is dry; for if it lies long, the pods will open and let out the feeds.

There are some of the woad planters who feed down the leaves in winter with sheep; which is a very bad method: for all plants which are to remain for a future crop should never be eaten by cattle, for that greatly weakens the plants; therefore those who eat down their wheat in winter with sheep are equally blameable.

Isatis, in zoology, a fynonyme of the canis lagopus. See CANIS

ISAURA, or Isaurus (anc. geog.), a ftrong city at mount Taurus, in Isauria, twice demolished; first by Perdiccas, or rather by the inhabitants, who, thro' despair, destroyed themselves by fire, rather than fall into the hands of the enemy; again by Servilius, who thence took the furname Ifauricus. Strabo fays there were two Ifauras, the old and the new, but fo near that other writers took them but for one.

ISAURIA, a country touching Pamphylia and Cilicia on the north, rugged and mountainous, fituated almost in mount Taurus, and taking its name from Isaura; according to fome, extending to the Mediterranean by a narrow slip. Stephanus, Ptolemy, and Zosimus, If the land, in which this feed is fown, should have make no mention of places on the sea; though Pliny

I Coloffice

Isaurica does, as also Strabo ; but doubtful, whether they are places in Isauria Proper, or in Pamphylia, or in Ci-

ISAURICA, a part of Lycaonia, bordering on mount

ISCA DUMNIORUM (anc. geog.); a town in Britain. Now Exeter, capital of Devonshire. W. Long. 30 40', Lat. 50 44. Called Caer-I/k in British, (Camden.)

ISCA SILURUM (anc. geog.); the flation of the Legio II. Augusta, in Britain. Now Caerleon, a town

of Monmouthshire, on the Uske. ISCHALIS, or Iscalis (anc. geog.); a town of the

Belgie in Britain. Now Ilchester, in Somersetshire, on the river Ill.

ISCHÆMUM, in botany: A genus of the monoccia order, belonging to the polygamia class of plants; and in the natural method ranking under the 4th order, Gramina. The calvx of the hermaphrodite is a biflorous glume; the corolla bivalved; there are three stamina, two ttyles, and one feed. The calyx and corolla of the male as in the former with three stamina.

ISCHIUM, in anatomy, one of the bones of the

pelvis. See ANATOMY, nº 41.

ISCHIA, an island of Iraly, in the kingdom of Naples, about 15 miles in circumference, lying on the coast of the Terra di Lavoro, from which it is three miles distant. It is full of agreeable valleys, which produce excellent fruits. It hath also mountains on which grow vines of an excellent kind: likewife

Ischra, a town of Italy, and capital of an island of the same name, with a bishop's see and a strong fort. Both the city and fortress fland upon a rock, which is joined to the island by a strong bridge; the rock is about seven furlongs in circumference. The city is like a pyramid of houses piled upon one another, which makes a very fingular and firiking appearance. At the end of the bridge next the city are iron gates, which open into a fubterraneous paffage, through which they enter the city. They are always guarded by foldiers who are natives of the island. E. Long. 13. 55. N. Lat. 40. 50.

ISCHURIA, 10 x vpia (formed from 10 x2 "I ftop," and "en " urine," in physic), a difease consisting in an entire suppression of urine. See MEDICINE Index.

paffages of the reins, ureters, or the neck of the bladder, as fand, stone, mucus, &c. It may also arile from an obstruction of the nerves which pass to the reins or bladder, as we fee it does in a pally of the parts below the diaphragm. The too great didention of the bladder may also produce the same effect : for the fibres being much lengthened, and confequently condenfed, the spirits necessary for their contraction cannot get admittance; whence it is that perfons who have retained their urine a long time, find a great deal of difficulty in discharging it.

ISELASTICS, a kind of games, or combats, celebrated in Greece and Asia, in the time of the Ro-

man emperors.

The victor at these games had very considerable privileges conferred on him, after the example of Augustus and the Athenians, who did the like to conquerors at the Olympic, Pythian, and Ishmian games. They were crowned on the foot immediately after their victory, had penfions allowed them, were furnished with provisions at the public cost, and were carried in triumph to their country.

ISENACH, a town of Germany, in the circle of Upper Saxony, from whence one of the Saxon princes takes the title of duke. There are iron mines

in the neighbourhood. E. Long. 9. 17. N. Lat.

ISENARTS, or EISENARTS, a confiderable town of Germany in Austria and in Styria; famous for its iron mines. E. Long. 15. 25. N. Lat. 46. 56.

ISENBURG, a large town of Germany, capital of a county of the fame name, with a handsome caffle, feated on the river Seine, in E. Long, 7, 14. N. Lat. 50, 28. The county belongs to the elector

ISENGHEIN, a town of the Austrian Netherlands, with the title of a principality, feated on the river Mandera, in E. Long. 3. 18. N. Lat. 50. 44.

ISERNIA, a town of Italy, in the kingdom of Naples, and in the county of Molife, with a bishop's fee. It is feated at the foot of the Appenines, in E. Long. 14. 20.

ISH, in Scots law, fignifies expiry. Thus we fay " the i/b of a leafe." It fignifies also to go out; thus we fay " free is and entry" from and to any place.

ISIA, Ioua, feafts and facrifices anciently folemnized in honour of the goddels Isis .- The Isia were full of the most abominable impurities; and for that reafon, those who were initiated into them were obliged to take an oath of fecrecy. They held for nine days fucceffively, but grew fo fcandalous, that the fenate abolished them at Rome, under the consulate of Piso and Gabinius. They were re-established by Augustus, and the emperor Commodus himself affitted at them, appearing among the priefts of that goddess with his head shaven, and carrying the Anubis.

ISIAC TABLE is one of the most considerable monuments of antiquity, discovered at Rome in 1525, and supposed by the various figures in bas relief upon it, to represent the featts of Itis, and other Egyptian deities: There have been various opinions as to the antiquity of this monument: fome have supposed that it was engraved long before the time when the Egyptians worshipped the figures of men and women. Others, among whom is bishop Warburton, apprehend, that it was made at Rome by perfons attached to the worship of Isis. Dr Warburton considers it as one of the most modern of the Egyptian monuments, on account of the great mixture of hieroglyphic characters. which it bears.

ISIACI, prieft of the goddes Isis .- Dioscorides tells us, that they bore a branch of fea-wormwood in their hands inflead of olive. They fung the praifes of the goddels twice a day, viz. at the riling of the fun, when they opened her temple; after which they begged alms the reit of the day, and returning at night, re-

Such was the life and office of the Ifiaci; they never covereed their feet with any thing but the thin bark of the plant papyrus, which occasioned Prudentius and others to fay they went bare-footed. They

word.

Bidorus wore no garments but linen, because Isis was the first who taught mankind the culture of this commodity. Iflam.

ISIDORUS, called DAMIATENSIS, or PELUSIOTA, from his living in a folitude near that city, was one of the most famous of all St Chryfostom's disciples, and flourished in the time of the general council held in 421. We have 2012 of his epiftles in five books. They are short, but well written, in Greek. The best edition is that of Paris, in Greek and Latin, printed in 1638, in folio.

ISIGNI, a town of France, in Lower Normandy, with a fmall harbour, and well known on account of its falt works, its cyder, and its butter. W. Long.

c. 50. N. Lat. 49. 20.

ISINGLASS. See ICHTHYOCOLLA. ISIS, a celebrated deity of the Egyptians, daughter of Saturn and Rhea, according to Diodorus of Sicily. Some suppose her to be the same as Io, who was changed into a cow, and restored to her human form in Egypt, where the taught agriculture, and governed the people with mildness and equity, for which reasons she received divine honours after death. According to fome traditions mentioned by Plutarch, Isis married her brother Ofiris, and was pregnant by him even before the had left her mother's womb. Thefe two ancient deities, as fome authors observe, comprehended all nature and all the gods of the heathens. Isis was the Venus of Cyprus, the Minerva of Athens, the Cybele of the Phrygians, the Ceres of Eleufis, the Proferpine of Sicily, the Diana of Crete, the Bellona of the Romans, &cc. Ofiris and Ifis reigned conjointly in Egypt; but the rebellion of Typhon, the brother of Ofiris, proved fatal to this fovereign. The ox and the cow were the fymbols of Ofiris and Ifis; because these deities, while on earth, had diligently applied themselves in cultivating the earth. As Isis was supposed to be the moon as Ofiris the fun, she was represented as holding a globe in her hand, with a vessel full of ears of corn. The Egyptians believed that the yearly and regular inundations of the Nile proceeded from the abundant tears which Isis shed for the lofs of Ofiris, whom Typhon had bafely murdered. The word Ifis, according to fome, fignifies "ancient," and on that account the infcriptions on the statues of the goddess were often in these words: "I am all that has been, that shall be, and none among mortals has hitherto taken off my veil." The worship of Isis was universal in Egypt, the priests were obliged to observe perpetual chaftity, their head was closely shaved, and they always walked barefooted, and clothed themselves in linen garments. They never eat onions, they abflained from falt with their meat, and were forbidden to eat the flesh of sheep and of hogs. During the night they were employed in continual devotion near the statue of the goddess. Cleopatra, the beautiful queen of Egypt, was wont to drefs herfelf like this goddefs, and affected to be called a fecond Ifis.

Isis, or Thames, a river that has its rife in Gloucestershire, and slows through only a small part of Wiltfhire. It enters this county near its fource, and begins to be navigable for boats at Cricklade; but after running in a ferpentine manner about four miles, it leaves Gloucestershire at a village called Castle Eaton.

ISLAM; the true faith, according to the Mahometans. See MAHOMETANISM.

CONTINENT, OF TERRA FIRMA. Several naturalists are of opinion, that the islands were formed at the deluge; others think, that there have been new islands formed by the casting up of vast heaps of clay, mud, fand, &cc.; others think they have been separated from the continent by violent storms, inundations, and earthquakes. These last have obferved, that the East Indies, which abound in islands more than any other part of the world, are likewife more annoyed with earthquakes, tempefts, lightnings, volcanoes, &c. than any other part. Others again conclude, that islands are as ancient as the world, and that there were fome at the beginning; and, among other arguments, support their opinion from Gen. x. 5.

ISLAND, a tract of dry land encompassed with Island. water; in which fense it stands contradistinguished from

and other paffages of Scripture.

Varenius thinks that there have been islands produced each of these ways. St Helena, Ascention. and other fleep rocky iflands, he supposes to have hecome fo by the fea's overflowing their neighbouring champaigns: but by the heaping up huge quantities of fand, and other terrestrial matter, he thinks the islands of Zealand, Japan, &c. were formed. Sumatra and Ceylon, and most of the East India islands. he thinks, were rent off from the main land; and concludes, that the islands of the Archipelago were formed in the fame way, imagining it probable that Deucalion's flood might contribute towards it. The ancients had a notion that Delos, and a few other islands, rofe from the bottom of the fea; which, how fabulous foever it may appear, agrees with later observations. Seneca takes notice, that the island Therafia rose thus out of the Ægean fea in his time, of which the mariners were eye-witnesses.

It is indeed very probable, that many islands have existed not only from the deluge, but from the creation of the world; and we have undoubted proofs of the formation of islands in all the different ways abovementioned. Another way, however, in which islands are frequently formed in the South Sea, is by the coralline infects. On this fubject the following curious differtation by Alexander Dalrymple, Efq; hath appeared in the Philosophical Transactions for the year

"These islands are generally long and narrow: they are formed by a narrow bar of land, inclosing the fea within it; generally, perhaps always, with fome ingress at least to the tide; commonly with an opening capable of receiving a canoe, and frequently fufficient to admit even larger veffels.

" The origin of these islands will explain their na-What led me first to this deduction was an obfervation of Abdul Roobin, a Sooloo pilot, that all the islands lying off the north-east coast of Borneo had

shoals to the eastward of them.

" These islands being covered to the westward by Borneo, the winds from that quarter do not attack them with violence. But the north-east winds, tumbling in the billows from a wide ocean, heap up the coral with which those feas are filled. This, obvious after florms, is perhaps at all other times imperceptibly

" The coral banks, raifed in the fame manner, become dry. These banks are found of all depths, at

Mand. all distances from shore, entirely unconnected with the land, and detached from each other; although it often happens that they are divided by a narrow gut with-

out bottom. " Coral banks also grow, by a quick progression, towards the furface; but the winds, heaping up the coral from deeper water, chiefly accelerate the formation of these into shoals and islands. They become gradually shallower; and, when once the fea meets with refiftance, the coral is quickly thrown up by the force of the waves breaking against the bank; and hence it is, that, in the open fea, there is fcarce an inflance of a coral bank having fo little water that a large ship cannot pass over, but it is also so shallow that a boat would ground on it.

" I have feen these coral banks in all the stages; fome in deep water, others with few rocks appearing above the furface: fome just formed into islands, withou' the least appearance of vegetation; and others from fuch as have a few weeds on the highest part, to those which are covered with large timber, with a bot-

tomless fea at a piftol-shot distance.

"The loofe coral, rolled inward by the billows in large pieces, will ground, and the reflux being unable to carry them away, they become a bar to coagulate the fand, always found intermixed with coral; which fand, being easiest raised, will be lodged at top. When the fand-bank is raifed by violent ftorms beyond the reach of common waves, it becomes a refting-place to vagrant birds, whom the fearch of prey draws thither. The dung, feathers, &c. increase the foil, and prepare it for the reception of accidental roots, branches, and feed, cast up by the waves, or brought thither by birds. Thus islands are formed: the leaves and rotten branches intermixing with the fand, form in time a light black mould, of which in general these islands consist; more fandy as less woody; and, when full of large trees, with a greater proportion of mould.

" Cocoa nuts, continuing long in the fea without lofing their vegetative powers, are commonly to be found in fuch islands; particularly as they are adapted to all foils, whether fandy, rich, or rocky.

"The violence of the waves within the tropics, must generally be directed to two points, according to

the monfoons.

" Hence the islands formed from coral banks must be long and narrow, and lie nearly in a meridional direction. For even supposing the banks to be round, as they feldom are when large, the fea, meeting most refiftance in the middle, must heave up the matter in greater quantities there than towards the extremities: and, by the fame rule, the ends will generally be open, or at leaft lowest. They will also commonly have foundings there, as the remains of the bank, not accumulated, will be under water.

"Where the coral banks are not exposed to the common monfoon, they will alter their direction; and be either round, extending the parallel, or be of irregular forms, according to accidental circumstances.

"The interior parts of these islands being sea, fometimes form harbours capable of receiving veffels of fome burthen, and, I believe, always abound greatly with fish; and, fuch as I have feen, with turtlegrafs and other fea-plants, particularly one fpecies, Island. called by the Sooloos gammye, which grows in little globules, and is fomewhat pungent, as well as acid, to

" It need not be repeated, that the ends of those islands only are the places to expect foundings; and they commonly have a shallow spit running out from

each point.

" Abdul Roobin's observation points out another circumstance, which may be useful to navigators; by confideration of the winds to which any islands are most exposed, to form a probable conjecture which fide has deepest water; and from a view which fide has the shoals, an idea may be formed which winds rage with most violence."

Islands from their situation enjoy many great advantages, the principal of which are thefe. In the first place, many benefits are derived to the inhabitants of an island from its unity. The very largest country on a continent is still but a part, which implies dependence, and is necessarily attended with a train of imperfections; from all of which, by the unerring and unalterable laws of nature, the people who live in an island are or may be entirely free. All countries on the continent are exposed to continual dangers, against which their inhabitants must be perpetually upon their guard. This renders a large military force requifite. It involves them in continual negociations, leagues, and alliances; all of which, however, cannot exempt them from frequent wars, or the miferies that attend them. and which have commonly bad effects on their internal policy. In the next place, the climate is generally mild and falubrious from the vapours of the furrounding fea, which according to the latitude abates the violence of heat, and moderates the rigour of cold, both which are fenfibly and constantly less than on continents under the fame elevation of the pole. We have a remarkable instance of this in the islands called anciently Stahades, in the modern Latin Infula Arearum, by us the islands of Hieres. They are three in number, lying in 430 north latitude, before the port of Toulon. In them, the fruits of France and Italy arrive at the highest perfection, and all the medical herbs of Italy, Greece, and Egypt, grow wild. Yet the climate is wonderfully temperate and pleafant in all

feafons *.—There is also commonly a greater variety, • See Ameand always a greater fertility, in the foil, occasioned rica, 10°6 chiefly by the warmth of the circumambient air, fre- 23.

quent showers, and, in consequence of both, being continually impregnated with vegetable falts. Another confiderable advantage arifes from its acceffibility on every fide, by which it is open to receive supplies from other countries, and has the conveniency of exporting its commodities and manufactures to all markets, and, in comparison of the continent, at all seasons. The opposite sides of an island may in regard to commerce be confidered as two countries; each has its ports, its proper commodities, its proper correspondencies; in confequence of which, it promotes the cultivation, and procures vent for the manufactures, of a large diffrict behind it; while the intermediate midland space finds a profit in that inland trade, which these two districts. fupply. The winds contrary on one fide are favourable on the other; and the fea, the common road to-

ISLE-ADAM, a town of France, with a handsome castle, and the title of a baron; seated on the river Oife, three miles from Beaumont, and 20 from Paris. E. Long. 2. 13. N. Lat. 49. 7.

Isle-de Dieu, a small island of France in the sea of Gascony, and on the coast of Poitou, from which it is

14 miles. W. Long. 2. 5. N. Lat. 46. 45.

IsLs-de-France, is one of the 12 general governments of France; bounded on the north by Picardy, on the west by Normandy, on the fouth by the government of Orleannois, and on the east by that of Champagne. It is about 90 miles in length, and as much in breadth; and is watered by the rivers Seine, Marne, Oife, and Aifne. The air is temperate, and the foil fertile; and it abounds in wine, corn, and fruits. It contains 10 fmall diffricts, and Paris is the capital city.

ISLEBIANS, in ecclefiaftical history, a name given to those who adopted the sentiments of a Lutheran divine of Saxony, called John Agricola, a disciple and companion of Luther, a native of Isleb, whence the name; who interpreting literally fome of the precepts of St Paul with regard to the Jewish law, declaimed against the law and the necessity of good

works. See Antinomians.

ISLINGTON, a village of Middlefex, on the north fide of London, to which it is almost contiguous. It appears to be of Saxon origin; and in the conqueror's time was written Isledon, or Isendon. The church is one of the prebends of St Paul's; to the dean and chapter of which a certain precinct here belongs, for the probate of wills, and granting administrations. The church was a Gothic structure, erected in 1503. and stood till 1751, when the inhabitants applied to parliament for leave to rebuild it, and foon after erected the prefent structure, which is a very substantial brick edifice, though it does not want an air of lightnefs. Its houses are above 2000, including the Upper and Lower Holloways, three fides of Newington-Green, and part of Kingsland, on the road to Ware. The White Conduit-house in this place, so called from a white stone conduit that stands before the entrance, has handfome gardens with good walks, and two large rooms one above the other for the entertainment of company at tea, &c. In the S. W. part of this village is that noble refervoir, improperly called New-River Head; though they are only two basons, which receive that river from Hertfordshire, and from whence the water is thrown by an engine into the company's pipes for the fupply of London. In the red-moat on the north fide of these basons, called Six Acre Field, from the contents of it, which is the third field beyond the White-Conduit, there appears to have been a fortress in former days, inclosed with a rampart and ditch, which is supposed to have been a Roman camp made use of by Suetonius Paulinus after his retreat, which Tacitus mentions, from London, before he fallied thence, and routed the Britons under their queen Boadicea; and that which is vulgariy, but erroneously, mans by a miracle; and Pomponius tells us, that in called Jack Straw's caftle, in a fquare place in the Lydia there were feveral islands so loose in their foun- S. W. angle of the field, supposed to have been the

Island. both coasts, is continually ploughed by vessels out- dations, that every little accident shook and removed. Island. ward and homeward bound, which keeps up that active and enterprizing fpirit which characterizes islanders. An island has at once the most extensive and the most effectual frontier, and this on all sides, subfilling for ever, without repairs, and without expence : and, which is still more, derives from this very frontier a great part of the subfiftence of its inhabitants, and a valuable article in its commerce, from its fisheries. It is commonly faid the fea is-a mine, but in truth it is better; its treasures are more lasting and more certain, procured by labour folely, and fit for use or for fale as foon as procured, quickly confumed, and thereby the fource of continual employment to a frout, hardy, laborious race of men, who likewise find employment for numbers, and are in various respects otherwife beneficial members of the community. The defence of this natural barrier, which, as we have faid, cofts nothing, but on the contrary yields much, is not only permanent, but in every respect more to be relied on than any that could be raifed by the skill and industry of men at the greatest expence. All these bleffings and benefits are infured by the leffon that Nature dictates, fome would fay the law which the prefcribes, to the inhabitants of every island, to place all their hopes in the affiduous cultivation of their own country, to bend all their endeavours to raifing and extending their commerce, and to put their trust in Providence, and in the fafeguard which she directs; men accustomed to robust and hardy exercises, and in what necessarily arises from their way of life, a naval force. The first inhabitants come in vessels, are for a time dependent on the country from whence they came, arrive at independence by enlarging their correspondence: and thus commerce is natural and effential to the people of an island; which is the reafon that they thrive fo long as they possess it, and gradually decline in the fame proportion in which that decays. ISLANDS of Ice. See ICE-Island. Floating-ISLANDS. Histories are full of accounts of

floating islands; but the greatest part of them are either false or exaggerated. What we generally see of this kind is no more than the concretion of the lighter and more viscous matter floating on the surface of the water in cakes; and, with the roots of the plants, forming congeries of different fizes, which, not being fixed to the shore in any part, are blown about by the winds, and float on the furface. These are generally found in lakes, where they are confined from being carried too far; and, in process of time, some of them acquire a very confiderable fize. Seneca tells us of many of these floating islands in Italy; and some later writers have described not a few of them in other places. But, however true these accounts might have been at the time when they were written, very few proofs of their authenticity are now to be found; the floating iflands having either disappeared again, or been fixed to the fides in fuch a manner as to make a part of the shore. Pliny tells us of a great island which at one time fwam about in the lake Cutilia in the country of Reatinum, which was discovered to the old Ro-No 169.

feat of the Roman general's pretorium or tent. In a pendulum as are performed in the fame space of sochronal Ifochronal, this parish are two charity-schools; one founded in 1613 by Dame Alice Owen, for educating 30 children. This foundation, together with that of a row of alms-houses, are under the care of the brewers company. Here is an hospital with its chapel, and a work-house for the poor. There is a spring of chalybeate water, in a very pleasant garden, which for some years was honoured by the constant attendance of the princess Amelia, and many persons of quality, who drank the waters. To this place, which is called New Tunbridge Wells, many people refort, particularly during the fummer, the price of drinking the waters being 10s. 6d. for the feafon. Near this place is a house of entertainment called Saddler's Wells, where, during the fummer feafon, people are amufed with balance mafters, walking on the wire, rope-dancing, tumbling,

and pantomime entertainments.

ISLIP, a town of Oxfordshire, 56 miles from London, is noted for the birth and baptism of Edward the Confessor. By the late inland navigation, it has communication with the rivers Merfey, Dee, Ribble, Oufe, Trent, Darwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, York, Lancaster, Westmoreland, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c. It has a good market for sheep, and some remains of an ancient palace, faid to have been king Ethelred's. Here is a charity-school. The chapel wherein Edward was baptized flood at a small distance north from the church, is ftill called the king's chapel, was entirely defecrated during Cromwell's usurpation, and converted to the meanest uses of a farm-yard; at present it has a roof of thatch. It is built of stone is vards long and 7 broad, and retains traces of the arches of an oblong window at the east end. This manor was given by Edward the Confessor to Westminster abbey, to which it still belongs.

ISMAELITES, the descendants of Ismael; dwelling from Havila to the wilderness of Sur, towards Egypt, and thus overfpreading Arabia Petræa, and therefore Josephus calls Ismael the founder of the

ISMARUS (anc. geog.), a town of the Cicones in Thrace, giving name to a lake. In Virgil it is called Ifmara. Servius supposes it to be a mountain of Thrace; on which mountain Orpheus dwelt.

ISNARDIA, in botany: A genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 17th order, Calycanthema. There is no corolla; the calyx is quadrifid; the capfule quadrilocular, and girt with the calvx.

ISNY, an imperial town of Germany, in Suabia, and in Algow; feated on the river Ifny, in E. Long.

9. 10. N. Lat. 47. 33.
ISNIC, a town of Turky in Afia, and in Natolia, with a Greek archbishop's see. It is the ancient Nice, famous for the first general council held here in 325. There is now nothing remaining of its ancient fplendor but an aqueduct. The Jews inhabit the greatest part of it; and it is feated in a country fertile in corn and excellent wine. E. Long. 30. 9. N. Lat. 47. 15.

ISOCHRONAL, is applied to fuch vibrations of

VOL. IX. Part I.

time; as all the vibrations or fwings of the same pendulum are, whether the arches it describes are shorter. or longer.

ISOCHRONAL-Line, that in which a heavy body is fun-

posed to descend without any acceleration.

ISOCRATES, one of the greatest orators of Greece, was born at Athens, 436 B. C. He was the fon of Theodorus, who had enriched himfelf by making mufical instruments, and gave his fon a liberal education. Ifocrates was the disciple of Prodicus. Gorgias, and other great orators. He endeavoured at first to declaim in public, but without success; he therefore contented himself with instructing his scholars, and making private orations. He always showed great love for his country; and being informed of the loss of the battle of Cheronea, he abstained four days from eating, and died, aged 98. There are ftill extant 21 of his discourses or orations, which are excellent performances, and have been translated from the Greek into Latin by Wolfins. Ifocrates particularly excelled in the juftness of his thoughts, and the elegance of his expressions. There are also nine letters attributed to him.

ISOETES, in botany; a genus of the natural order of filices, belonging to the cryptogamia class of plants. The antheræ of the male flower are within the base of the frons or leas. The capsule of the female flower is bilocular, and within the base of the

ISOLA, a town of Italy, in the kingdom of Naples, and in the Farther Calabria, with a bishop's fee. It is a fea port town, and is feated 15 miles fouth-east of St Severina. E. Long. 7. 33. N. Lat.

ISOPERIMETRICAL FIGURES, in geometry, are fuch as have equal perimeters or circumferences.

ISOPYRUM, in botany: A genus of the polygynia order, belonging to the polyandria class of plants; and in the natural method ranking under the 26th order, Multifilique. There is no calyx, but five petals : the nectaria trifid and tubular; the capfules recurved and polyspermous.

ISOSCELES TRIANGLE, in geometry, one that

has two equal fides

ISPAHAN, or, as the Persians pronounce it, Spauhawn, the capital of Persia, is situated in the province of Irac, Agemi, or Perfia Proper, upon the ruins, as generally supposed, of the ancient Hecatompylos, or. as others think, of the Aspa of Ptolemy. Most of the eastern astronomers and geographers place it in N. Lat. 32. 25. E Long. 86. 40. It stands in a very extensive plain, furrounded by mountains; and has eight diffricts belonging to it, that contain about 400 towns and villages. The fertility of the foil, the mildness of the seasons, and the fine temperature of the air, all conspire to render Ispahan one of the most charming and delightful cities in the world. It is unanimously agreed, that the present city is of no great antiquity; and the two parts into which it is divided, preferve the names of two contiguous towns, from the junction of which it was formed. The inhabitants of these, notwithstanding their neighbourhood, bear an inveterate antipathy to each other; which they discover on all public occasions. Spauhawa

OWES

lipahan. owes the glory it now possesses to the great Shah A- trees, with canals and fountains in the middle t others lipahan has a who, after the conquest of the kingdoms of Lar narrow and crooked, and arched a top ; others again, and Ormus, charmed with the fituation of this place, though extremely narrow, as well as turning and made it the capital of his empire, between the years winding many ways, were of an incredible length, and 1620 and 1628. The mountains, with which this refembled fo many labyrinths; that, at a small distance city is furrounded, defend it alike from the fultry heats of summer and the piercing winds of the winter feafon: and the plain on which it flands is watered by feveral rivers, which contribute alike to its ornament and use. Of these rivers, the Zenderoud, after being joined by the Mahmood, paffes by Spauhawn: where it has three fine bridges over it, and is as broad as the Seine at Paris. The waters of these united ffreams are fweet, pleasant, and wholesome, almost beyond comparison; as, indeed, are all the springs found in the gardens belonging to the houses of Spauhawn. The extent of Spauhawn is very great; not less, perhaps, than 20 miles within the walls, which are of earth, poorly built, and fo covered with houses and fhaded with gardens, that in many places it is difficult to discover them. The Persians are wont to fay, Spauhawn nispigehon, i. e. Spauhawn is half the world. Sir John Chardin fays, that though fome reckoned 11,000,000 inhabitants in it, he did not himself look upon it as more populous than London. At a diflance, the city is not eafily diffinguished; for many of the fireets being adorned with plantains, and every house having its garden, the whole looks like a wood. The streets in general are neither broad nor convenient ; there being three great evils which attend them : the first is, that being built on common sewers, these are frequently broke up, which is very dangerous, confidering that most people are on horseback; the second is, that there are many wells or pits in them, which are not less dangerous; the third arises from the people's emptying all their ordure from the tops of their houses : this last, indeed, is in some measure qualified by the dryness of the air, and by its being quickly removed by the peafants, who carry it away to dung their grounds. Some reckon eight, and others ten gates, befides posterns; but all agree that there is no difficulty of entering at any hour of the day or night. The three principal fuburbs annexed to it are, Abbasabad, built by Shah Abas, and belonging to the people of Tauris; Julfa, inhabited by a colony of Armenians, called by fome New Julfa, to diftinguish it from the ancient city of that name, fituated in Armenia, upon the Araxes, whence the original inhabitants of New Julfa were brought; and Ghebr-Abad, or, as the Arabs pronounce it, Kebr Abad, the street of the magians, occupied entirely by the profesfors of magifm, or the religion of the ancient Perfians. The river Zenderoud separates the city of Ifpahan and Abas-Abad from Julfa and Ghebr-Abad. This city has fuffered greatly fince the commencement of the dreadful rebellion in 1721; the whole kingdom from that period, till a few years ago, having been almost a continued scene of blood, ravages, and confufion. A celebrated modern traveller, who was on the fpot, tells us, that the inhabitants of Julfa, not many years before the above revolution happened, amounted to 30,000 fouls; had 13 churches, and above 100 priests; and paid the Persian court 200 tomans yearly for the free exercise of their religion : that some of the Areets were broad and handsome, and planted with

from the town, there were public walks adorned with plane-trees on either hand, and ways paved with stones, fountains, and cisterns : that there were above 100 caravanferas for the ufe of merchants and travellers, many of which were built by the kings and prime nobility of Persia: that, as little rain fell there, the ftreets were frequently full of dult, which rendered the city difagreeable during a confiderable part of the fummer; that the citizens, however, to make this inconvenience more tolerable, used to water them when the weather was warmer than usual: that there was a castle in the eaftern part of the town, which the citizens looked upon as impregnable, in which the public money, and most of the military stores, were said to be kept: that, notwithstanding the baths and caravanseras were almost innumerable, there was not one public hospital : that most of the public buildings were rather neat than magnificent, though the great meydan or market-place, the royal palace (which is three quarters of a league in circumference), and the alley denominated Toher-bag adjoining to it, made a very grand appearance: that the former contained the royal mosque; the building denominated kaylorich, where all forts of foreign commodities were exposed to fale : and the mint, styled by the Persians ferraa-khoneh, where the current-money of the kingdom was coined: that, befides the native Persians, there were then in Ispahan above 10,000 Indians all supported by trade; 20,000 Georgians, Circassians, and Tartars of Dagheltan or Lefgees, with a confiderable number of English, Dutch, Portuguese, and a few French : that the Capachins, discalceated or bare-footed Carmelites. Jesuits, Dominicans, and Austin friars, had likewise their convents here, though they were unable to make any converts; and that there were above 100 mosques and public colleges. But fince the fatal period abovementioned, the fuburb of Julfa was almost totally abandoned by the Armenians. The government of Ifpahan, 23 leagues long and as many broad, comprehending feveral diffricts, most of them formerly well peopled, appeared not many years ago little better than a defert; most of the inhabitants of that fertile and delightful tract being fled and dispersed. Multitudes of them had taken a precarious refuge in the mountains of Loristan, lying between Ispahan and Sufter, whose lands were left untilled, and their houses mouldered into ruins. In fhort, all the diffresses of an unfuccefsful war, or the invation of a barbarous epemy, could not have plunged the people of Ifpahan into greater mifery than the victories of their tyrannical king Nadir Shah, who feemed more folicitous to humble his own fubjects than his enemies. See PERSIA. ISPIDA, in ornithology. See ALCEDO.

ISRAEL, the name which the angel gave Jacob. after having wreftled with him all night at Mahanaim or Penuel (Gen. xxxii. 1, 2, and 28, 29, 30. and Hofea xii. 3.) It fignifies the conqueror of God, or a prince of God, or, according to many of the ancients, a man who fees God.

By the name of Ifrael is fometimes understood the perfon Ifraelites person of Jacob: sometimes the whole people of Ifrael, or the whole race of Jacob: and fometimes the kingdom of Ifrael, or of the ten tribes, diftinct from the kingdom of Judah.

ISRAELITES, the defcendants of Ifrael: who were at first called Hebrews, by reason of Abraham, who came from the other fide of the Euphrates; and afterwards Israelites, from Ifrael the father of the twelve patriarchs; and laftly Yews, particularly after their return from the captivity of Babylon, because the tribe of Judah was then much stronger and more numerous than the other tribes, and foreigners had fcarce

any knowledge of this tribe.

ISSACHAR, one of the divisions of Palestine by tribes; lying to the fouth of Zabulon, fo as by a narrow flip to reach the Jordan, between Zabulon and Manaffeh, Josh, xix. But whether it reached to the fea, is a question; fome holding that it did; an affertion not cafy to be proved, as Joshua makes no mention of the fea in this tribe, nor does Josephus extend it farther than to mount Carmel; and in Josh, xvii, 10. Asher is said to touch Manasseh on the north, which could not be if Isfachar extended to the fea.

ISSOUDUN, a confiderable town of France, in Berry. It carries on a great trade in wood, cattle, cloth, hats, and flockings; is feated partly on a plain, and partly on an eminence. E. Long. 2. 5. N. Lat.

ISSUE, in common law, has various applications: being fometimes taken for the children begotten between a man and his wife-fometimes, for profits growing from amercements or fines-fometimes, for profits of lands and tenements-but more frequently for the point of matter depending in fuit, whereupon the parties join, and put their cause to the trial of the jury.

In all these occasions, iffue has but one fignification, which is, an effect of a cause preceding; as the children are the effect of the marriage between the parents; the profits growing to the king or lord, from the punishment of any man's offence, are the effect of his transgression; the point referred to the trial of twelve men, is the effect of pleading, or process. See

ISSUES, in furgery, are little ulcers made defignedly by the furgeon in various parts of the body, and kept open by the patient, for the preservation and re-

covery of his health.

ISSUS, now AJAZO, a town of Cilicia in Natolia, with a harbour on the Levant Sea, a little to the north of Scanderoon, E. Long. 36. 25. N. Lat. 36. 56.

Near this place, in a difficult pass between the mountains and the fea, Alexander the Great fought his fecond battle with Darius. One great cause of the defeat which the Persians received here was the bad conduct of their monarch, who led his numerous forces into a narrow place, where they had not room to act. Alexander was so much surprised when he first received the news that Darius was behind him, that he could fearce believe it to be true: but when he was thoroughly fatisfied of the fact, and that Darius had again paffed the river Pinarus, he called a council of war, wherein, without asking any body's advice, he only told them, that he hoped they would remember their former actions; and that they,

who where always conquerors, were about to fight people who were always beat. He further observed. that Darius seemed to be infatuated, since he had with fuch expedition quitted an open and champaign country, where his numbers might have acted with advantage, to fight in a place inclosed, where the Macedonian phalanx might be well drawn up, and where his numbers could only incommode him. He then made the necessary dispositions for repassing the mountains, posted guards where he found them necessary and then commanded his troops to refresh themselves, and to take their rest till morning.

At break of day he began to repass the mountains, obliging his forces to move in close order where the road was narrow, and to extend themselves as they had more room; the right wing keeping always close to the mountain, and the left to the fea-shore. On the right there was a battalion of heavy-armed troops. befides the targeteers under the command of Nicanor the fon of Parmenio. Next thefe, extending to the phalanx, were the corps of Cœnus and Perdiccas: and on the left, the respective bodies commanded by A-myntas, Ptolemy, and Meleager. The foot appointed to support them were commanded by Craterus; but the whole left wing was committed to Parmenio, with firict orders not to decline from the fea-shore, lest the Persians should surround them. Darins ordered 20,000 foot and 30,000 horse to retire, finding that he already wanted room to draw up the reft. His first line confisted of 30,000 Greek mercenaries, having on their right and left 60,000 heavy-armed troops, being the utmost the ground would allow. On the left, towards the mountain, he posted 20,000 men, which, from the hollow fituation of the place, were brought quite behind Alexander's right wing. The reft of his troops were formed into clofe and ufeless lines behind the Greek mercenaries, to the number in all of 600,000 men. When this was done, he fuddenly recalled the horse who had retired, sending part of them to take post on his right against the Macedonians commanded by Parmenio; and the rest he ordered to the left towards the mountain: but, finding them unferviceable there, he fent the greatest part of them to the right; and then took upon himfelf, according to the cultom of the Perfian kings, the command of the main body. As foon as Alexander perceived that the weight of the Persian horse was difposed against his left wing, he dispatched, with as much secrecy as he could, the Theffalian cavalry thither, and fupplied their places on the right by fome brigades of horse from the van, and light-armed troops. He also made such dispositions, that, notwithstanding the mighty advantage of the hollow mountain, the Perfians could not furround him. But, as these precautions had considerably weakened the centre of his army, he ordered those advanced posts on the enemy's left, of which he was most apprehenfive, to be attacked at the very beginning of the fight; and, when they were easily driven from them, he recalled as many troops as were necessary to strength-

When all things were in order, Alexander gave ftrict command, that his army should march very flowly. As for Darius, he kept his troops fixed in their pofts, and in fome places threw up ramparts; whence the

Z z 2

Macedonians rightly observed, that he thought himself already a prisoner. Alexander at the head of the right wing engaged first, and without any difficulty broke and defeated the left wing of Darius. But, endeavouring to pass the river Pinarus after them, his troops in some measure losing their order, the Greek mercenaries fell upon them in flank, and made them fight, not only for victory, but for their lives. Ptolemy the fon of Seleucus, and 120 Macedonians of fome rank, were killed upon the fpot. But the foot next to Alexander's right wing coming in feafonably to its relief, fell upon the mercenaries in flank, amongst whom a dreadful carnage was made; they being in a manner furrounded by the horse and light-armed troops. which at first pursued the left wing, and the foot that now paffed the river. The Perfian horse on the right flill fought gallantly; but, when they were thoroughly informed of the rout of their left wing and of the destruction of the Greek mercenaries, and that Darius himself was fled, they began to break, and betake themselves to flight also. The Thessalian cavalry purfued them close at the heels; and the narrow craggy roads incommoded them exceedingly, fo that vait numbers of them perished. As for Darius, he sled, soon after the left wing was broken, in a chariot with a few of his favourites: as far as the country was plain and open, he escaped well enough; but, when the roads became rocky and narrow, he quitted it, and, mounting a horse, rode all the night: his chariot, in which were his cloak and his bow, fell into the hands of Alexander, who carried them back to his camp.

In respect to the battle of Issus, Diodorus informs us, that Alexander looked every where about for Darius; and, as foon as he discovered him, with his handful of guards attacked him and the flower of the Perfian army which was about him; being as defirous of obtaining this victory by his personal valour, as of fubduing the Persian empire by the courage of his foldiers. But when Oxathres, the brother of Darius, faw Alexander's defign, and how fiercely he fought to accomplish it, he threw himself, with the horse who were about him, between his brother's chariot and the enemy, where an obstinate fight was maintained, till the dead bodies rose like an entrenchment about the chariot of Darius. Many of the Perfian nobility were flain, and Alexander himfelf was wounded in the thigh. At last, the horses in the chariot of Darius started, and became fo unruly, that the king himfelf was forced to take the reins; the enemy, however, preffed fo hard upon him, that he was constrained to call for another chariot, and mounted it in great danger. This was the beginning of the rout, which foon after became general. According to this author, the Perfians loft 200,000 foot, and 10,000 horse; the Macedonians 300 foot, and 150 horse.

Justin informs us, that the Persian army consisted of 400,000 foot, and 100,000 horse. He says, that the battle was hard fought; that both the kings were wounded; and that the Perfians still fought gallantly when their king fled, but that they were afterwards fpeedily and totally routed: he is very particular as to their loss, which he fays amounted to 61,000 foot, 10,000 horse, and 40,000 taken prisoners; of the Macedonians he fays there fell no more than 130 foot, and

150 horse. Curtius says, that of the Persians there Ishmia fell 100,000 foot, and 10,000 horse: of Alexander's army 504, he fays, were wounded; 32 foot and 150. horse killed. That we may not suspect any error in transcribers, his own observation confirms the fact : Tantulo impendio ingens victoria stetit, " So small was the coft of fo great a victory."

ISTHMIA, or ISTHMIAN Games; one of the four folemn games which were celebrated every fifth year in Greece. They had the name from the Ishmus of Corinth, where they were celebrated. In their first institution, according to Paufanias, they confisted only of funeral rites and ceremonies in honour of Melicertes: but Thefeus afterwards, as Plutarch informs us, in emulation of Hercules, who had appointed games at Olympia in honour of Jupiter, dedicated those to Neptune, his reputed father, who was regarded as the particular protector of the Isthmus and commerce of Corinth. The same trials of skill were exhibited here as at the other three facred games ; and particularly those of music and poetry. games, in which the victors were only rewarded with garlands of pine-leaves, were celebrated with great magnificence and fplendor as long as paganifm continued to be the established religion of Greece; nor were they omitted even when Corinth was facked and burnt by Mummius the Roman general; at which time the care of them was transferred to the Sicyonians, but was restored again to the Corinthians when their city was rebuilt.

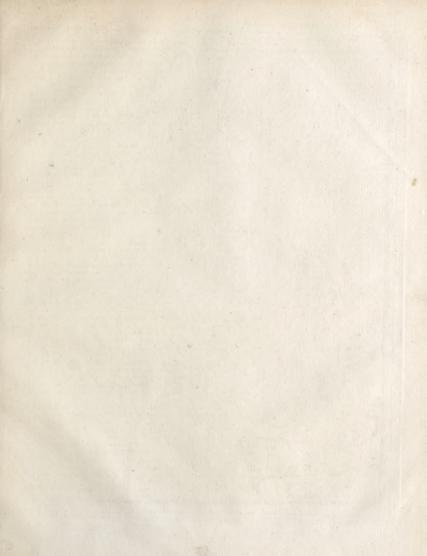

ISTHMUS, a narrow neck, or flip of ground, which joins two continents; or joins a penintula to the terra firma, and separates two seas. See PENIN-

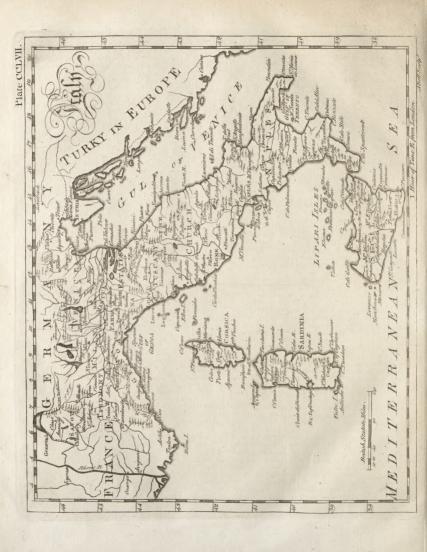

The most celebrated isthmuses are, that of Panama or Darien, which joins North and South America : that of Suez, which connects Afia and Africa; that of Corinth, or Peloponnesus, in the Morea; that of Crim-Tartary, otherwife called Taurica Cherfonefus; that of the peninfula Romania, and Eriffo, or the isthmus of the Thracian Chersonesus, twelve furlongs broad, being that which Xerxes undertook to cut through. The ancients had feveral defigns of cutting the isthmus of Corinth, which is a rocky hillock, about ten miles over; but they were all in vain, the invention of fluices being not then known. There have been attempts too for cutting the ifthmus of Suez, to make a communication between the Red Sea and the Mediterranean: but these also failed; and in one of them, a king of Egypt is faid to have lost 120,000

ISTRIA, a peninfula of Italy, in the territory of Venice, lying in the north part of the Adriatic fea. It is bounded by Carniola on the north; and on the fouth, east, and west, by the fea. The air is unwholefome. especially near the coast; but the foil produces plenty of wine, oil, and pastures; there are also quarries of fine marble. One part of it belongs to the Venetians, and the other to the house of Austria. Cabo d'Istria is the capital town.

ITALIAN, the language spoken in Italy. See the article LANGUAGE.

This tongue is derived principally from the Latin: and of all the languages formed from the Latin, there is

ginal than the Italian. Italy

It is accounted one of the most perfect among the modern tongues. It is complained, indeed, that it has too many diminutives and fuperlatives, or rather augmentatives; but without any great reason: for if those words convey nothing farther to the mind than the just ideas of things, they are no more faulty than our pleonafms and hyperboles.

The language corresponds to the genius of the people, who are flow and thoughtful: accordingly, their language runs heavily, though fmoothly; and many of their words are lengthened out to a great degree. They have a great tafte for music; and to gratify their paffion this way, have altered abundance of their primitive words; leaving out confonants, taking in vowels, foftening and lengthening out their terminations, for the fake of the cadence.

Hence the language is rendered extremely mufical, and fucceeds better than any other in operas and fome parts of poetry: but it fails in strength and nervousnefs; and a great part of its words, borrowed from the Latin, become fo far disguised, that they are not

eafily known again.

The multitude of fovereign states into which Italy is divided, has given rife to a great number of different dialects in that language; which, however, are all good in the place where they are ufed. The Tufcan is ufually preferred to the other dialects, and the Roman pronunciation to that of the other tities; whence the Italian proverb, Lingua Tofcana in bocca Romana.

The Italian is generally pretty well understood throughout Europe; and is frequently fpoken in Germany, Poland, and Hungary. At Constantinople in Greece, and in the ports of the Levant, the Italian is ufed as commonly as the language of the country: indeed in those places it is not spoken fo pure as in Tufcany, but is corrupted with many of the proper words and idioms of the place; whence it takes a new name, and is called Frank Italian.

ITALIC CHARACTER, in printing. See LETTER. ITALICA (anc. geog.), a town of Baetica in Spain, built by Scipio Africanus, after finishing the Spanish war, for the reception of the wounded foldiers. At first it was a mufficipium; afterwards a colony: which was a matter of wonder to the emperor Adrian, the privileges of a municipium being beyond those of a colony (Gellius). Famous for being the birth-place of the emperors Trajan and Adrian, and of the poet Silius Italius. Now Seuilla Vieja, fearce four miles from Seville; a fmall village of Andalufia on the Guadalquivir .- Corfinium in Italy was thus alfo called.

ITALY, one of the finest countries of Europe, lying between 7 and 10 degrees of E. Long. and between 37 and 46 degrees of N. Lat. On the north, north-west, and north-east, it is bounded by France, Switzerland, the country of the Grifons, and Germamy; on the east, by the Adriatic sea or gulf of Venice; and on the fouth and west, by the Mediterranean; its figure bearing some resemblance to that of informs us. a boot. Its length from Aosta, at the foot of the

Italian none which carries with it more visible marks of its ori- being in some places near 400 miles, in others not Italy. above 25 or 30.

Italy was anciently known by the names of Satur-nia, Oenotria, Helperia, and Aufonia. It was called its different Saturnia from Saturn; who, being driven out of Crete by his fon Jupiter, is fupposed to have taken refuge here. The names of Oenotria and Aufonia, is borrowed from its ancient inhabitants the Oenotrians and Aufones; and that of Hesperia or Western was given it by the Greeks, from its fituation with respect to Greece. The names of Italia or Italy, which in process of time prevailed over all the rest, is by some derived from Italus, a king of the Siculi: by others, from the Greek word Italos, fignifying an ox; this country abounding, by reafon of its rich paltures, with oxen of an extraordinary fize and beauty. All thefe names were originally peculiar to particular provinces of Italy, but afterwards applied to the whole

This country, like most others, was in ancient times Division in divided into a great number of petty flates and king-ancient doms. Afterwards when the Gauls fettled in the times.

western, and many Greek colonies in the eastern pares, it was divided, with respect to its inhabitants, into three great parts, viz. Gallia Cifalpina, Italy properly fo called, and Magna Grecia. The most western and northern parts of Italy were in great part poffeffed by the Gauls; and hence took the name of Gallia, with the epithets of Cifalpina and Citerior, because they lay on the fide of the Alps next to Rome; and Togata, with relation to the Roman gown or drefs which the inhabitants used: but this last epithet is of a much later date than the former. This appellation was antiquated in the reign of Augustus, when the division of Italy into eleven provinces, introduced by that prince, took place. Hence it is that the name of Cifalpine Gaul frequently occurs in the authors who flourished before, and fcarce ever in those who wrote after, the reign of Augustus. This country extended from the Alps and the river Varus, parting it from Tranfalpine Gaul, to the river Aclus; or, as Pling will have it, to the city of Aucona, in the ancient Picenum. On the north, it was divided from Rhætia by the Alps, called Alpes Rhatica; and from Illyricum by the river Formio: but on this fide, the borders of Italy were, in Pliny's time, extended to the river Arfia in Istria. On the fouth, it reached to the Liguitic fea, and the Apennines parting it from Etruria: fo that under the common name of Cifalpine Gaul were comprehended the countries lying at the foot of the Alps, called by Pliny and Strabo the Subalpine countries, Liguria, Gallia Cifpadana, and Transpadana. Italy, properly fo called, extended, on the coast of the Adriatic, from the city of Ancona to the river Trento, now the Fortore; and on the Mediterranean, from the Macra to the Silarus, now the Sele. Magna Græcia comprised Apulia, Lucania, and the country of the Brutii. It was called Greece, because most of the cities on the coast were Greek colonies. The inhabitants gave it the name of Great, not as if it was larger than Greece, but merely out of oftentation, as Pliny

All thefe countries were inhabited by a great num-Alps in Savoy, to the utmost verge of Calabria, is ber of different nations fettled at different times, and about 600 miles; but its breadth is very unequal, from many different parts. The names of the most

the Romans.

origin was utterly unknown, and confequently were thought to have none; the Sabines, Hetrurians or Tufeans, the Umbri, Samnites, Campani, Apulii, Calabrii, Lucanii, the Brutii, and the Latins. From a colony of the latter proceeded the Romans, who gradually Subdued by fubdued all these nations one after another, and held them in subjection for upwards of 700 years. All these nations were originally brave, hardy, temperate, and well skilled in the art of war; and the Romans much more fo than the relt. Their fubiection to Rome, however, inured them to flavery; their oppreffion by the emperors broke their spirit; and the vast wealth which was poured into the country from all parts of the world, during the time of the Roman prosperity, corrupted their manners, and made them degenerate from their former valour. Of this degeneracy the barbarous nations of the north took the advantage to invade the empire in innumerable multi-tudes. Though often repelled, they never failed to return; and it was found necessary to take great numbers of them into the Roman fervice, in order to defend the empire against the rest of their countrymen. Bythe He- In the year 476, the Heruli, prefuming on the fervices they had done the empire, demanded a third part of the lands of Italy; and being refused, chose one Odoacer, a man of low birth, but of great valour and experience, for their king; and having totally destroyed the remains of the Roman empire, proclaimed Odoacer king of Italy. The new monarch, however, did not think proper to alter the Roman form of goverument, but fuffered the people to be governed by the fenate, confuls, &c. as before. He enjoyed his dignity in peace till the year 488, when Zeno, emperor of Constantinople, being hard pressed by Theodoric king of the Oftrogoths, advised him to turn his arms against Odoacer, whom he could easily overcome, and thus make himfelf fovereign of one of the finest

Invaded by the Oftrogoth.

countries in the world.

Theodoric accepted the propofal with great joy, Theoderic and fet out for Italy, attended by an infinite number of people, carrying with them their wives, children. and effects, on waggons. Several Romans of great diffinction attended him in this war; while, on the other hand, many of his countrymen chose to remain in Thrace, where they became a separate nation, and lived for a long time in amity with the Romans. The Goths, being deflitute of shipping, were obliged to go round the Adriatic. Their march was performed in the depth of winter; and during the whole time, a violent famine and plague raged in their army. They were also opposed by the Gepidæ and Sarmatians; but at last having defeated these enemies, and overcome every other obflacle, they arrived in Italy in the year 489. Theodoric advanced to the river Sontius, now Zonzo, near Aquileia, where he halted for some time to refresh his troops. Here he was met by Odoacer at the head of a very numerous army, but composed of many different nations commanded by their respective chiefs, and confequently without fufficient union or zeal for the common cause. Theodoric therefore Odoacer de-gained an eafy victory, cut many of his enemies in pie-

remakable of them were the Aborigines, or those whose and soon forced him to a second engagement. The Goths obtained another victory; but it cost them dear. Odoacer's men made a much better refiltance than before, and great numbers fell on both fides. The victory, however, was fo far decifive, that Odoacer was obliged to thut himself up in Ravenna; fo that Theodoric having now no enemy to oppose him in the field, befieged and took feveral important places, and among the reft Milan and Pavia. At the fame time. Tufa, commander in chief of Odoacer's forces, deferted to the enemy with the greatest part of the troops he had with him, and was immediately employed in conjunction with a Gothic officer in purfuit of his fovereign. Odoacer had left that city, and was advanced as far as Faenza, where he was closely befieged by Tufa; but the traitor, declaring again for his old mafter, joined him with all his troops, and delivered up feveral officers that had been appointed by Theodoric to ferve under him. These were fent in irons to Ravenna; and Odoacer being joined by Frideric, one of Theodoric's allies, with a confiderable body of troops, once more advanced against his enemies. He recovered all Liguria, took the city of Milan, and at last besieged Theodoric himself in Pavia. The Goths, having brought all their families and effects along with them, were greatly dillreffed for want of room; and must have undoubtedly submitted, if their enemies had continued to agree among themfelves. The quarrels of his followers proved the ruin of Odoacer. Theodoric, finding that the enemy remitted the vigour of their operations, applied for fuccours to Alaric king of the Vifigoths, who had fettled in Gaul. As the Vifigoths and Oftrogoths were originally one and the same nation, and the Viligoths had received among them some years before a great number of Oftrogoths under the conduct of Videmer cousin-german to Theodoric, the supplies were readily granted. The inaction of the enemy gave these succours time to arrive; upon which Theodoric instantly joined them, and marching against his enemies gave them a total overthrow. Odoaccr again took refuge in Ravenna, but was closely befieged by Theodoric in 490. The fiege lasted three years; during which Odoacer defended himself with great bravery, and greatly annoyed the befiegers with his fallies. Theodorie, however, impatient of delay, leaving part of his army to blockade the city, marched with the rest against the strong holds which Odoacer had garrifoned. All these he reduced with little difficulty; and in 492 returned to the fiege of Ravenna. The belieged were now reduced to great firaits both by the enemy without and a famine within, the price of wheat being rifen to fix pieces of gold per bushel. On the other hand, the Goths were quite worn out with the fatigues of fuch a long fiege; fo that both parties being willing to put an end to the war, Odoacer fent John bishop of Ravenna to Theodoric with terms of accommodation. Jornandes informs us, that Odoacer only begged his life; which Theodoric bound himfelf, by a folemn oath, to grant him: but Procopius fays, that they agreed to live together on equal terms. This lait feems very improbable: but whatever were the terms Submite, ces, and took their camp. Odoacer retired to the of the agreement, it is certain that Theodoric did not and is put plains of Verona, and encamped there at a small di- keep them; for having a few days after invited Odoa- to death. flance from the city; but Theodoric purfued him close, cer to a banquet, he dispatched him with his own

feated.

Tenler.

hand. All his fervants and relations were massacred at the fame time; except his brother Arnulphus, and a few more, who had the good luck to make their escape, and retired beyond the Danube.

Thus Theodoric became master of all Italy, and Theodoric took upon himfelf the title of king of that country, as king of Ita- Odoacer had done before; though, with a pretended ly, and uses deference to the emperor of Constantinople, he fent his power meffengers afking liberty to assume that title after he with mode- had actually taken it. Having feoured his new kingmation.

dom as well as he could by foreign alliances. Theodoric next applied himself to legislation, and enacted many falutary laws befides those of the Romans which he retained. He chose Ravenna for the place of his refidence, in order to be near at hand to put a stop to the incutfions of the barbarians. The provinces were governed by the same magistrates that had presided over them in the times of the emperors, viz. the confulares, correctores, and prafides. But befides thefe, he fent, according to the custom of the Goths, inferior judges, diflinguished by the name of counts, to each city. These were to administer justice, and to decide all controversies and disputes. And herein the polity of the Goths far excelled that of the Romans. For in the Roman times a whole province was governed by a confularis, a corrector, or a præfes, who refided in the chief city, and to whom recourse was to be had at a great charge from the most remote parts: but Theodoric, befides these officers, appointed not only in the principal cities, but in every small town and village, inferior magistrates of known integrity, who were to administer justice, and by that means save those who had law-fuits the trouble and expence of recurring to the governor of the whole province; no appeals to diflant tribunals being allowed, but in matters of the greatest importance, or in cases of manifest injustice.

Under the administration of Theodoric Italy enjoyed as great happiness as had been experienced under the very best emperors. As he had made no alteration in the laws except that above mentioned; fo he contented himfelf with the same tributes and taxes that had been levied by the emperors; but was, on all occasions of public calamity, much more ready to remit them than most of the emperors had been. He did not treat the natives as those of the other Roman provinces were treated by the barbarians who conquered them. These stripped the ancient proprietors of their lands, effates, and poffessions, dividing them among their chiefs; and giving to one a province with the title of duke, to another a frontier country with the title of marquis; to some a city with the title of count, to others a caftle or village with the title of baron. But Theodoric, who piqued himfelf upon governing after the Roman manner, and observing the Roman laws and institutions, left every one in the full enjoyment of his ancient property. As to religion, though he himfelf, like most of his countrymen, professed the tenets of Ar us, he allowed his subjects to profess the orthodox doctrine without moleftation, giving liberty even to the Goths to renounce the doctrines in which they had been educated, and embrace the contrary opinions. In fhort, his many virtues, and the happiness of his fubjects, are celebrated by all the historians of those times. The end of his reign, however, was fullied by

the death of the celebrated philosopher Boethius, and Italy. his father-in-law Symmachus. They were both beheaded in Pavia, on an unjust suspicion of treason; Behrade and fearce was the fentence put in execution when the Boothing king repented, and abandoned himself to the most and Sympungent forrow. The excess of his grief affected his machus, understanding: for not long after, the head of a large and dies of sish being served up to supper, he fancied the head of the fifh to be that of Symmachus threatening him in a ghaftly manner. Hereupon, leized with horror and amazement, he was carried to his bed-chamber, where he died in a few days, on the 2d of September 526.

After the death of Theodoric, the kingdom devolved to Athalric his grandfon; who being at that time only eight years of age, his mother Amalasuntha took upon her the regency. Her administration was equally upright with that of Theodoric himfelf; but the barbarians of whom her court was composed, finding fault with the encouragement the gave to learning, forced her Amalafunto abandon the education of her fon. The latter the regents therenpon plunged into all manner of wickedness, and governs behaved to his mother with the greatest arrogance; and equitably, the faction finding themselves thus strengthened, at last

commanded the queen to retire from court.

Amalafuntha, exerting her authority, feized three of the ringleaders of the fedition, whom she confined in the most remote parts of Italy. But these maintaining a fecret correspondence with their friends and relations, never ceafed to ftir up the people against her: infomuch, that the queen, apprehending that the faction might in the end prevail, wrote to the emperor Justinian, begging leave to take refuge in his dominions. The emperor readily complied with her request, offering a noble palace at Durazzo for her habitation; but the queen having in the mean time caused the three ringleaders to be put to death, and no new diffurbances arifing thereupon; fhe did not accept of the emperor's offer. In 533, Athalric having contracted a lingering diftemper by his riotous living and debaucheries, Amalasuntha, to avoid the calamities with which Italy was threatened in case of his death, formed a defign of delivering it up to Justinian : but before her scheme was ripe for execution, Athalric died. Upon which the queen took for her colleague one Theodotus her coufin; obliging him, however, to swear that he This he very readily did, but foon forgot his promife; Is treacherand when she took the liberty to remind him of it, foned, and caused her to be seized and confined in an island of the put to lake Bolfena in Tufcany. But as Theodotus had great death; reason to believe that this conduct would be resented by Justinian, he obliged her to write to him that no injury or injuffice had been-done her. Along with this letter he fent one written by himfelf, and filled with heavy complaints against Amalasuntha. The emperor, however, was fo far from giving ctedit to what Theodotus urged against her, that he openly espoused her cause, wrote her a most affectionate letter, and affured her of his protection. But before this letter

facilitate the enterprife, ufed his utmost endeavours to induce the Franks to affift him. To his folicitations he added a large fum of money; which laft was very acceptable to his new allies. They promifed to affift makes war the emperor to the utmost of their power; but instead of performing their promife, while Justinian's arms were employed against the Goths, Thierri, the eldest fon of Clovis, feized on feveral cities of Liguria, the Alpes Cottiæ, and great part of the present territory of Venice, for himself. Justinian, however, found sutficient refources in the valour of Belifarius, not withflanding the defection of his treacherous allies. This celebrated general was vested with the supreme command, and absolute authority. His influctions were to pretend a voyage to Carthage, but to make an attempt upon Sicily; and if he thought he could fucceed in the attempt, to land there; otherwife to fail for Africa, without discovering his intentions. Another general, named Mundus, commander of the troops in Illyricum, was ordered to march into Dalmatia, which was subject to the Goths, and attempt the reduction of Salonæ, the better to open a passage into Italy. This he accomplished without difficulty, and Belifarius made himfelf mafter of Sicily fooner than he himself had expected. The island was reduced on the last of December 535; upon which Belifarius, without loss of time, passed over to Reggio, which opened its gates to him. From Reggio he purfued his march to Rome, the provinces of Abrutium, Lucania, Puglia, Calabria, and Samnium, readily fubmitting to him. The city of Naples endured a fiege: but Belifarius entered in through an aqueduct, and gave it up to be plundered by his foldiers.

Theodotus, alarmed at these successes, and having neither capacity nor inclination to carry on the war, fent ambaffadors to Justinian with proposals of peace. He agreed to renounce all pretentions to the island of Sicily; to fend the emperor yearly a crown of gold weighing 300 pounds; and to supply him with 3000 men whenever he should think proper to demand them. Several other articles were contained in the propofal, which amounted to the owning of Justinian for his lord, and that he held the crown of Italy only through his favour. As he apprehended, however, that thefe offers might not yet be fatisfactory, he recalled his ambasfadors for further orders. They were now de fired to inform Justinian, that Theodotus was willing tus offers to to refign the kingdom to him, and content himself

refigns the with a penfion fuitable to his quality. But he obliged kingdom. them by an oath not to mention this propofal, till they found that the emperor would not accept of the other. The first proposals were accordingly rejected as they had supposed; upon which the ambassadors produced the fecond, figned by Theodotus himfelf, who in his letter to the emperor told him, among other things, that being unacquainted with war, and addicted to the fludy of philosophy, he preferred his quiet to a kingdom. Juftinian, transported with joy, and imagining the war already finished, answered the king in a most obliging manner, extolling his wisdom, and giving him besides what he demanded the greatest honours of the empire. The agreement being confirmed by mutual oaths, lands were affigned to Theodotus out of the king's domain, and orders were dif-Nº 170.

folved upon an immediate war with the Goths; and, to patched to Belifarius to take possession of Italy in his Italy.

In the mean time, a body of Goths having entered Dalmatia, with a defign to recover the city of Salonæ, were encountered by an inferior army of Romans, commanded by the fon of Mundus above mentioned. The Goths proved victorious; and the young general of the Romans was, killed, and most of his army cut in pieces. Mundus marched against the enemy to revenge the death of his fon; but met with no better fuccefs, his troops being defeated, and he himfelf killed in the engagement. Upon this the Romans abandoned Salonæ and all Dalmatia; and Theodotus, ela Theodotus ted with his fuccess, refused to fulfil the articles of the refuses to treaty. Justinian dispatched Constantianus, an officer of fulfil the great valour and experience, into Illyricum, with or articles of ders to raife forces there, and to enter Dalmatia; at the same time he wrote to Belifarius to pursue the war with the utmost vigour.

The Goths were now reduced to the greatest straits. Constantianus drove them out of Dalmatia; and Belifarius having reduced all the provinces which compose the prefent kingdom of Naples, advanced towards Rome. The chief men of the nation, finding their king incapable of preventing the impending ruin, affembled without his confent, and difpatched ambaffadors to Belifarius with propofals of peace. Thefe proposals were rejected; and Belisarius returned for answer, that he would hearken to no terms, nor sheath his fword, till Italy was reannexed to the empire to which it belonged. The Goths finding Theodotus He is rice fill inactive, unanimously deposed him; and chose in posed, and his ftead one Vitiges, a man of great valour, but of a Vitigeschomean descent. Theodotus fled to Ravenna; but the fen in his flead. new king dispatched after him a messenger, who soon

overtook him and cut off his head. Vitiges began his government by writing a circular letter, in which he exhorted his countrymen to exert their ancient courage, and fight bravely for their lives and liberties. He then marched with what forces he could collect towards Rome : but not thinking himfelf able to defend that city against the Roman forces, he abandoned it to Belifarius; and arriving at Ravenna was joined by the Goths from all parts, fo that he foon found himfelf at the head of a confiderable army. Belifarius in the mean time entered Rome without opposition, on the 9th or 10th of December 537. The Gothic garrifon retired by the Porta Flaminia, while Belifarius entered by the Porta Afinaria. Leudaris, governor of the city, who staid behind, was fent, together with the keys, to the emperor. Belifarius immediately applied himself to the repairing of the walls and other fortifications; filled the granaries with corn, which he caused to be brought from Sicily; and flored the place with provisions, as if he had been preparing for a fiege; which gave no fmall uneafiness to the inhabitants, who chose rather that their city should lie open to every invader, than that they should be liable to the calamities of a fiege. While Belifarius was thus employed at Rome, the city of Benevento, with great part of the territory of Samnium, was delivered up to him: at the same time the cities of Narnia, Spoleto, and Perusia, revolting from the Goths, received Roman garrifons; as did most of the cities of Tuscany.

Ttaly. He tollects a great -army.

In the mean time, Vitiges having collected an army of 150,000 men, refolved to march directly to Rome, and engage Belifarius; or, if he declined an engagement, to lay fiege to the city. But apprehending that the Franks, who were in confederacy with the emperor, might fall upon him at the fame time, he fent ambaffadors to them, with offers of all the Gothic possessions in Gaul, besides a considerable sum of money, provided they joined him against the emperor. The Franks with their usual treachery confented to the propofal, received the money and the territories agreed on, and then refused to fulfil the terms of the treaty. Vitiges, however, began his march to Rome, leaving behind him all the fortified towns on the road, the reduction of which he knew would coft him too much trouble. Belifarius, whose army, reduced by the to above 5000 men, dispatched messengers to Constantianus in l'uscany; and to Bessas, by nation a Goth, but of the emperor's party, in Umbria, with orders to join him with all possible expedition; writing at the fame time to the emperor himself for supplies in the most pressing manner. Constantianus joined him pursuant to his orders; and soon after, Bestas, falling in with part of the enemy's vanguard, killed a confiderable number of them, and put the rest to flight. Belifarius had built a fort upon a bridge about a mile from Rome, and placed a strong garrison in it to dispute the passage with the enemy; but the garrison, feized with a panic at the approach of the Goths, abandoned their post in the night, and sled into Cam-pania. Early in the morning Vitiges passed over great part of his army, and marched on till he was met by Belisarius, who, knowing nothing of what had happened, came with 1000 horse to view the ground about the bridge. He was greatly surprised when he beheld the enemy marching up against him : however, left he should heighten their courage by his slight or retreat, he flood his ground, and received the enemy at the head of his fmall body, exposing himself, without his usual prudence and discretion, to the greatest dangers. Being known by fome fugitives, and discovered to the enemy, they all aimed at him alone, which made his own men the more folicitous to defend him : fo that the whole contest was for fome time about his person. At last the Goths were driven back to their camp, which the Romans with great temerity attemp-'ted to force. In this attempt, however, they met with fuch a vigorous refistance, that they foon abandoned the enterprise, and retired with precipitation to a neighbouring eminence; whence they were forced down by the enemy, put to flight, and purfued to the very gates of the city. Here they were in greater danger than ever; for those within, fearing that the enemy might in that confusion enter with them, refused to admit them. The general himself cried out earnestly to them, telling who he was, and commanding them to open the gates; but as they had been informed by those who first fled, that he was slain, and they could not diffinguish him on account of the blood and dust with which his face was covered, they gave no ear to what he faid. In this extremity, having encouraged his men, who were now driven into a narrow compasa, to make a last effort, he put himself at their head, and

attacked the enemy with fuch fury, that the Goths, imagining fresh troops were fallying out upon them, began to give ground, and at last retired to their camp. The Roman general did not purfue them; but entered the city, where he was received with loud accla-

A few days after, the city was closely invested by Rome be-Vitiges; who, to diffress the inhabitants, pulled down sieged by the aqueducts by which water was conveyed into the the Goths, city, and which had been built at an immenfe charge by the Roman emperors. Belifarius on his part omitted nothing for his defence; infomuch that the cowardly

citizens affembled in a tumultuous manner, and railed at the general on account of his supposed temerity. Vitiges, to encourage this mutinous disposition, difpatched ambassadors to the fenate with proposals of peace. These ambassadors, however, were dismissed without any answer, and the siege was begun with great vigour. Belifarius made a gallant defence ; and in feven months is faid to have destroyed 40,000 of the Goths. About this time he received a supply of 1600 archers from the emperor; and thefe, in feveral fuccefsful fallies, are faid to have killed 4000 more of

The Romans, elated with their fuccesses, now became impatient for an engagement; and at last, notwithflanding all the remonstrances of their general, forced him to lead them out against the enemy. The fuccefs was answerable to the rash attempt. The Romans were defeated, with the loss of some of their bravest officers, and a great many of their common foldiers; after which they contented themselves with fallying out in fmall parties, which they commonly did

with the greatest success.

But though the Romans had the fatisfaction of thus cutting off their enemies, they were most grievously afflicted with a famine and plague; infomuch that the inhabitants, no longer able to bear their calamities, were on the point of forcing Belisarius to venture a fecond battle, when a feafonable fupply of troops, viz, 3000 Ifaurians, 800 Thracian horse, and 1300 horse of other nations, together with 500 Italians who joined them by the way, arrived at Rome. Belifarius immediately fallied out by the Flaminian gate, and fell upon the Goths in order to give his allies time to enter by the opposite side of the city, which they did without the lofs of a man .- The Goths hearing of the arrival of these troops, and their numbers being magnified as is usual in such cases, began to despair of becoming mafters of the city; especially as the famine and plague raged with great violence in their camp, and their army was much reduced. Ambaffadors were therefore dispatched to Belisarius with proposals of peace; but the only thing they could obtain was a cessation of arms for three months, during which time they might fend ambaffadors to the emperor. The negociations with the emperor, however, proved unfuccefsful; and the fiege was purfued with great vigour till Vitiges received the news of the taking of Rimini by the Romans. As this city was but a day's journey from Ravenna, the Goths were fo much alarmed, that they immediately raifed the fiege of Rome, after it had continued a year and nine days. Belifarius fell upon their rear as they passed the bridge of the Tiber, and 3 A

Obstinate engagement be-Eween the Goths and Romans.

VOL. IX. Part I.

cut great numbers of them in pieces, while others, ftruck with a panic, threw themselves into the river and were drowned. The flege gaifed.

The first enterprise of Vitiges, after raising the fiege of Rome, was an attempt upon Rimini: but while he was employed in this fiege, the Romans made themselves masters of Milan; upon which a Gothic general, named Uraia, was immediately dispatched with a powerful army to retake it. In the mean time, however, a fupply of 7000 Romans arrived from the emperor, under the command of Narfes, a celebrated general. The immediate confequence of this was the raifing of the fiege of Rimini: for Vitiges perceiving the two Roman armies coming against him, and concluding, from the many fires they made, that they were much more numerous than they really were, fled in such haste, that the greatest part of the baggage was left behind. The confusion of the Goths was so great, that, had not the garrifon been extremely feeble, they might have eafily cut them off in their retreat, and thus put an end to the war at once. The fuccess of the Romans, however, was now retarded by fome mifunderstandings between the two generals: fo that, though Belifarius made himfelf mafter of Urbinum and Urbiventum, while Narfes reduced fome other places, yet the important city of Milan was fuffered to fall into the hands of the Goths, who maffacred all the inhabitants that were able to bear arms, to the number of 300,000, and fold the women for flaves. The city was also totally demolished; and this disaster made fuch an impression on the mind of Justinian, that he immediately recalled Narfes, and gave the command of

his troops to Belifarius. Vitiges, who had promifed himfelf great advantages from the difagreement of the two generals, was much disappointed by the recall of Narses; and therefore dreading the power of Belifarius when at the head of a formidable army, thought of engaging in alliance with fome foreign prince. In his choice, however, he was fomewhat at a lofs. He knew the treachery of the Franks, and therefore did not apply to them. He applied to the Lombards; but, though tempted by the offer of a large fum of money, they continued inviolably attached to the Roman interest. At last he found means to perfuade Chofroes king of Perfia to make war upon Justinian, which he thought would infallibly procure the recall of Belifarius. But the Roman general, understanding his design, pushed on the war in the most vigorous manner; while, in the mean time, the treacherous Franks, thinking both nations fufficiently weakened by their mutual hostilities, resolved to attack both, and seize upon the country for which they contended. Accordingly, Theodehert, unmindful of the oaths he had taken both to the Goths and Romans, paffed the Alps at the head of them on their march, the Goths concluded that they were come to their affiftance; and therefore took care to fupply them with provisions. Thus they cross-

falling unexpectedly upon them, drove them out of the Italy. camp with great flaughter, and feized on their baggage and provisions. A body of Romans that lay at a small distance from the Goths concluding that they had been defeated by Belifarius, advanced with great joy to meet him as they imagined; but the Franks falling unawares upon them, treated them as they had done the Goths, and made themselves masters of their camp. Thus they acquired a very confiderable booty and flore of provisions: but the latter being foon confumed, and the country round about quite exhaufted, valt numbers of the Franks perished; fo that Theodebert at last found himself obliged to return. In his way he destroyed Genoa and feveral other places, and arrived in his own dominions loaded with booty.

In the mean time, Belifarius was making great pro-Success of gress. He took the cities of Auximum and Fæsulæ Belisarius. after an obstinate fiege; the inhabitants of the former having for fome time fed on grafs before they would furrender. After this he invested Ravenna, the capital of all the Gothic dominions in Italy. The place was defended by a very numerous garrison, commanded by the king in person, who exerted all his bravery in the defence of his metropolis. As the fiege, however, was pushed on with great vigour, it was evident that the city must at last submit; and the great successes of the Romans began to give jealoufy to the neighbouring potentates. Theodebert king of the Franks offered to affift Vitiges with an army of 500,000 men; but Belifarius, being informed of this negociation, fent am-baffadors to Vitiges, putting him in mind of the treachery of the Franks, and affured him that the emperor was ready to grant him very honourable terms. The king, by the advice of his counfellors, rejected the alliance of the Franks, and fent ambaffadors to Constantinople; but in the mean time, Belifarius, in order to bring the citizens to his own terms, bribed one of them to let fire to a magazine of corn, by which means the city was foon ftraitened for want of provisions. But, notwithstanding this disaster, they still continued to hold out, till the arrival of the ambaffadors from Conftantinople, who brought very fa-vourable terms. Thefe were, That the country beyond the Po, with respect to Rome, should remain to the Goths; but that the rest of Italy should be yielded to the emperor, and the royal treasure of the Goths should be equally divided between him and the king. To these conditions, however, Belifarius positively refused to affent; being defirous of leading captive the king of the Goths, as he had formerly done the king of the Vandals, to Conftantinople. He therefore purfued the fiege with more vigour than ever, without hearkening to the complaints of his foldiers and officers, who were quite tired out with the length of the fiege : he only obliged fuch of the officers as were of opi-150,000, or, as fome will have it, 200,000 men, and nion that the town could not be taken, to express entered Liguria. As no hostilities were committed by their opinion in writing, that they might not deny it afterwards.

The Goths were as weary of the fiege as the Romans; but fearing left Justinian should transplant ed the Po without opposition; and having secured the them to Thrace, formed a resolution, without the conbridge, marched towards the place where a body of fent of their king, of furrendering to Belifarius himfelf, Goths were encamped; who, looking upon them as and declaring him emperor of the west. To this they friends, admitted them without hefitation. But they were the more encouraged by the refufal of Beliwere foon convinced of their miftake; for the Franks farius to agree to the terms proposed by the emperor;

Milan taken by the Goths,

21 Ktaly invasled by the Franks.

Ravenna

and make himfelf emperor of Italy. Of this, however; Belifarius had no defign; but thought proper to accept of the title, in order to accelerate the furrender of the city, after acquainting his principal officers with what had paffed. Vitiges at last discovered the plot; but finding himfelf in no condition to oppose it, he commended the refolution of his people, and even wrote to Belifarius, encouraging him to take upon him the title of king, and affuring him of his affillance. Hereupon Belifarius pressed the Goths to surrender; which, however, they still refused, till he had taken an oath that he would treat them with humanity, and maintain them in the possession of all their rights and privileges. Upon this he was admitted into the city, where he behaved with great moderation towards the and Vitiges Goths; but feized on the royal treasure, and secured taken prithe person of the king. The Roman army, when it entered Ravenna, appeared fo very inconfiderable, that the Gothic women on beholding it could not forbear fpitting in the faces of their hufbands, and reviling

them as cowards.

The captivity of Vitiges, and the taking of Ravenna, did not put an end to the war. Belifarius was foon after recalled to take the command of the army in the east. The Goths were greatly surprised that he thould leave his new kingdom out of regard to the orders of the emperor; but, after his departure, chose one Ildebald, a man of great experience in affairs both civil and military, for their king. He revived the drooping fpirits of his countrymen, defeated the Romans, and reduced all the province of Venetia; but was in a short time murdered, and Eraric, a Rugian, fucceeded to the throne. He was fcarce invested with the fovereignty, when his fubjects began to think of deposing him, and raising Totila to the throne; which the latter accepted, upon condition that they previously dispatched Eraric. This was accordingly done : after which Totila was proclaimed king of Italy in the

year 542. Success of

gainst the

Remans.

The new king proved a very formidable enemy to the Romans, who now loft ground every-where. They made an attempt on the city of Verona; in which they miscarried through their own avarice, having difputed about the division of the plunder till the opportunity of taking the town was past. They were next defeated in two bloody engagements; the confequence of which was, that the Goths made themselves masters of all the strong places in Tuscany. From thence marching into Campania and Samnium, they reduced the strong town of Beneventum, and laid siege to Naples. During the fiege of this last place, several detachments were fent from the king's army, which took Cumæ, and recovered all Brutia, Lucania, Apulia, and Calabria, where they found confiderable fums which had been gathered for the emperor's use. The Romans, in the mean time, disheartened by their loffes, and deprived of those sums which should have paid their wages, refused to take the field. A confiderable fleet was therefore fent by Justinian to the relief of Naples: but Totila, having timely notice of this defign, manned, with incredible expedition, a great number of light veffels; which, falling unex-

whence they concluded that he defigned to revolt, and made prifoners of all on board, excepting a few who escaped in their boats. A similar fate attended another fleet dispatched from Sicily for the fame purpofe. They put to fea in the depth of winter; and, meeting with a violent florm, were driven ashore near the enemy's camp; who funk the fhips, and made what flaughter they pleafed of the feamen and foldiers. Upon this fecond difaster, the Neapolitans, despairing of further relief, fubmitted to Totila; who granted them honourable terms, and treated them with great humanity. As they had been long pinched with famine, Totila, apprehending they might endanger their lives by indulging their appetites too much at first. placed guards at the gates to prevent their going out, taking care at the same time to supply them sparingly with provisions, but increasing their allowance every day. Being thus by degrees reltored to their former ftrength, he ordered the gates to be fet open, and gave every one full liberty to stay in the city or remove as he thought fit. The garrifon he treated with extraor-dinary kindness. They were first supplied with ships to carry them to Constantinople; but the king having discovered that their real design was to fail to Rome, in order to reinforce the garrifon of that city (which they knew he was foon to beliege), he was fo far from punishing them as they expected, that he furnished them with horses, waggons, and provisions, and ordered a body of Goths to efcort them to Rome by land, as the winds had proved unfavourable for their paffage by fea.

Totila having thus become mafter of Naples and most of the other fortresses in these parts, began to think of reducing Rome also. He first attempted to perfuade the citizens to a furrender: but finding his perfuasions ineffectual, he fent a detachment of his army into Calabria to reduce Otranto, which had not yet submitted; after which, he marched with the rest of his forces against the towns in the neighbourhood of Rome. The city of Tibur, now Tivoli, about 18 miles from Rome, was betrayed to him; and all the inhabitants, together with their bishop, were put to the fword. Several other strong-holds in the neighbourhood of that city he took by ftorm; fo that Rome was in a manner blocked up by land, all communication with

the neighbouring country being cut off.

Justinian, in the mean time, being greatly perplexed by the bad news he every day received from Italy. recalled Belifarius from Perfia, notwithstanding the fuccess which attended him there. To save Rome, however, was now impossible even for Belifarius himfelf. As foon as he arrived in Italy, finding himfelf unable either to relieve the towns which were befieged, or to stop the progress of the Goths, he dispatched letters to Justinian, informing him, that being destitute of men, arms, and money, it was impossible for him to profecute the war; upon which the emperor ordered new levies to be made, all the veterans being engaged in the Persian war. In the mean time, however, Totila purfued his good fortune; took the cities of Firmum, Afculum, Auximum, Spoletum, &c. and at length advanced to Rome, which he invested on all fides. As he drew near the city, two officers, whom 25 Rome be-Belifarius had fent into the city, ventured to make a fieged, pectedly on the Roman fleet, took or funk every ship, fally, though contrary to the express orders of their

of their men being cut in pieces, narrowly escaped falling into the hands of the enemy. Beliffius made feveral attempts to relieve the city : but all of them. however well concerted, by fome accident or other proved unfuccefsful; which gave him fo much uneafinefs, that he fell into a feverish diforder, and was for forne time thought to be in danger of his life. The city was foon reduced to great straits; a dreadful famine enfued; and the unhappy citizens having confumed every thing that could be supposed to give them nourishment, even the grass that grew near the walls, were obliged, it is faid, to feed on their own excrements. Many put an end to their lives, in order to free themselves from the intolerable calamities they fuffered. The reft addreffed their governor Beffas in the most pathetic manner, intreating him to fupply them with food : or if that was not in his power, either to give them leave to go out of the town, or to terminate their miferies by putting them to death. Beffas replied, that to fupply them with food was impossible; to let them go, unfafe; and to kill them, impious. In the end, however, he fuffered those who were willing to retire, to most of them either died on the road, or were cut in pieces by the enemy. At last, the besieged, unable to bear their miferies any longer, began to mutiny, and to press their governor to come to an agreement with Totila. This, however, he still refused; upon which, four of the Ifaurians who guarded one of the gates, went privately to the camp of Totila, and offered to that taken, admit him into the city. The king received this propolal with great joy; and fending four Goths of great thrength and intrepidity into the town along with them, he filently approached the gates in the nighttime with his whole army. The gates were opened by the Ifaurians, as they had promifed; and upon the first alarm, Bessas with most of the soldiers and officers fled out of the town. The inhabitants took fanctuary in the churches; and only 60 of them and 26 foldiers were killed after the town was taken. Totila, however, gave his foldiers full liberty to plunder the city: which they did for feveral days together, flripping the inhabitants of all their wealth, and leaving nothing in their houses but naked walls; by which means many perfons of distinction were reduced to beg their bread from door to door. In the house of Bessas was found an immense treasure, which he had scandaloufly amaffed during the fiege, by felling to the people, at an exorbitant price, the corn which had been flored up for the use of the garrison.

Totila, thus become matter of Italy, fent ambassadors to Justinian with very respectful letters, desiring to live on the same terms with him that Theodoric had done with his predecessor Anastasius; promising in that case to respect him as his father, and to affift him, when he pleafed, with all his force, against any other nation whatever. On the contrary, if the emperor rejected his offers, he threatened to level Rome with the ground, to put the whole fenate to the fword, and to carry the war into Illyricum. The emperor returned no other answer, than that he referred the whole to Belifarius, who had full power to manage all things of that nature. Upon this Totila refolved to destroy the city;

general, thinking they should surprise the Goths; but and had actually thrown down a third part of the they were themselves taken in an ambuscade, and, most wall, when he received a letter from Belifarius, diffuading him from his intention. After having feriously considered this letter. Totila thought proper to alter his refolution with regard to the destruction of the city; but fent every one of the inhabitants into Lucania, without leaving a fingle person in the metropolis. Belifarius hearing of this, immediately returned to the capital, and undertook to repeople and repair it. He cleared the ditch which had been filled by Totila, but was for the prefent obliged to fill up the breaches in the walls with stones loofely heaped upon one another: and in this fituation the city was again attacked by the Goths. Belifarius, however, had taken care to fupply the inhabitants with plenty of provitions, fo that they were now in no danger of fuffering by famine; and the affaults of the enemy were vigoroufly repelled, notwithstanding the bad situation of the fortifications, so that Totila at last abandoned the enterprise.

In the mean time the Persians gained great advan- Relifering tages over the Romans in the East, so that there was a recallednecessity for recalling Belifarius a fecond time. He was no fooner gone, than Totila renewed his efforts with greater vigour than ever; and at the fame time the leave the city, upon paying him a fum of money; but Franks, concluding that both Romans and Goths would be much weakened by fuch a destructive war, seized upon Venetia, which belonged to both nations, and made it a province of the French empire. Totila did not oppose them; but having obtained a reinforcement of 6000 Lombards, returned immediately before Rome, fully intent on making himself master of that metropolis. Having closely invested it by sea and land, he hoped in a short time to reduce it by famine; but against this the governor wifely provided, by causing corn to be fown within the walls; fo that he could probably have defied the power of Totila, had not the city been again betrayed by the Ifaurians, who opened one

of the gates and admitted the enemy.

Thus the empire of the Goths was a third time effablished in Italy; and Totila, immediately on his becoming mafter of Rome, dispatched ambassadors to Justinian, offering to assist him as a faithful ally against any nation whatever, provided he would allow him the quiet possession of Italy. But Justinianwas fo far from hearkening to this proposal, that he would not even admit the ambaffadors into his presence; upon which Totila resolved to pursue the war with the utmost vigour, and to make himself mafler not only of those places which the Romans possesfed in Italy, but in Sicily also. This he fully accom- Narses sent plished; when Narses, who had formerly been joined in into Italy, the command with Belifarius, was appointed general, with absolute and uncontrouled authority. But while this general was making the necessary preparations for his expedition, Totila, having equipped a fleet of 300 galleys, fent them to pillage the coasts of Greece, where they got an immense booty. They made a defcent on the island of Corfu; and having laid it waste, they failed to Epirus, where they furprifed and plundered the cities of Nicopolis and Anchialus, taking many ships on the coast, among which were some laden

with provisions for the army of Narses. After these fuccesses they laid siege to Ancona in Dalmatia. Being

defeated, however, both by sea and land, Totila once

more fent ambaffadors to Conftantinople, offering to yield

Who de-

feats and

Sicily and all Dalmatia, to pay an annual tribute for Italy, and to affift the Romans as a faithful ally in all their wars; but Justinian, bent upon driving the Goths out of Italy, would not even fuffer the ambaffadors to

appear in his prefence.

Totila finding that no terms could be obtained, began to levy new forces, and to make gree preparations by fea and land. He foon reduced the illands of Corfica and Sardinia: but this was the last of his fucceffes. Narfes arrived in Italy with a very formidable grmy, and an immense treasure to pay the troops their arrears, the want of which had been one great cause of the bad fuccefs of Belifarius in his last expedition. He immediately took the road to Rome; while Totila affembled all his forces, in order to decide the fate of Italy by a general engagement. The battle proved very obstinate; but at last the Gothic cavalry being kills forila, put to the rout, and retiring in great confusion among the infantry, the latter were thereby thrown into fuch diforder, that they could never afterwards rally. Narfes, observing their confusion, encouraged his men to make a last effort; which the Goths not being able to withstand, betook themselves to slight, with the loss of 6000 men killed on the fpot. Totila finding the day irrecoverably loft, fled with only five horsemen for his attendants; but was purfued and mortally wounded by a commander of one of the bodies of barbarians who followed Narfes. He continued his flight, however, for fome time longer; but was at last obliged to halt in order to get his wound dreffed, foon after which he

expired. This difafter did not yet entirely break the foirit of the Goths. They chose for their king one Teia, defervedly esteemed one of the most valiant men of their nation, and who had on feveral oc . fions diftinguished himself in a most eminent manner. All the valour and experience of Teia, however, were now infufficient to ftop the progress of the Romans. Narfes made himfelf mafter of a great number of cities, and of Rome itself, before the Goths could affemble their forces. The Roman general next proceeded to invest Cumæ: which Teia determined at all events to relieve, as the royal treasure was lodged in that city. This brought on an engagement, which, if Procopius is to be credited, proved one of the most bloody that ever was fought. The Roman army confifted of vast multi-

tudes brought from different nations: the Goths were few in comparison; but, animated by despair, and knowing that all was at take, they fought with the utmost fury. Their king placed himfelf in the first rank, to encourage his men by his example; and is faid to have given fuch proofs of his valour and conduct as equalled him to the most renowned heroes of antiquity. The Romans discovering him, and knowing that his death would probably put an end to the battle, if not to the war itself, directed their whole force against him, some attacking him with spears, and others discharging against him showers of darts and arrows. Teia maintained his ground with great intrepidity, received the missive weapons on his shield. and killed a great number of the enemy with his own

hand. When his shield was so loaded with darts that

he could not eafily wield it, he called for another.

Thus he shifted his shield three times; but as he at-

tempted to change it another time, his breaft being

necessarily exposed for a moment, a dart struck him in that moment with fuch force, that he immediately fell down dead in the place where he had stood from the beginning of the battle, and upon heaps of the enemy whom he had killed. The Romans, feeing him fall, cut off his head and exposed it to the fight of the Goths, not doubting but they would be immediately disheartened and retire. In this, however, they were disappointed. The Goths maintained the fight with great vigour, till night put an end to the engagement. The next day the engagement was renewed early in the morning, and continued till night: but on the third day, the Goths defpairing of being able to overcome an enemy fo much fuperior to them in numbers. fent deputies to Narses, offering to lay down their arms, provided fuch of them as chose to remain in I. taly were allowed to enjoy their ellates and poffessions without moleftation, as fubjects of the empire; and those who were willing to retire elsewhere, were fuffered to carry with them all their goods and effects. To thefe terms Narfes readily affented; and thus the The end of empire of the Gotlis in Italy was finally destroyed, the the empire country now becoming a province of the eastern Ro- of the man empire.

Italy.

ready observed, by many barbarous nations, among whom were the Lombards, at that time fettled in Pannonia. On the conclusion of the war, they were difmiffed with rich prefents, and the nation for fome time continued faithful allies to the Romans. In the mean time Justinian dying, Narfes, who governed Italy with an abfolute fway, was accused to the emperor Justin II. and to the empress Sophia, of afpiring to the fovereignty of the country. Hereupon he was recalled, and Longinus fent to fucceed him. As Narfes was an eunuch, the empress is reported to have faid, that his employment at Constantinople should be to distribute in the apartment of her women the portion of wool which each was to fpin. Narfes, enraged at this farcasin, replied, that he should begin such a web as the should never be able to finish; and immediately dif- Narfes inparched meffengers to Alboinus king of the Lom-vites the bards, inviting them into Italy. Along with the mef- Lombards fengers he fent fome of the best fruits the country afforded, in order to tempt him the more to become ma-

In this conquest Narses had been assisted, as al-

bas

fter of fuch a rich kingdom.

Alboinus, highly pleafed with the opportunity of invading a country with which his fubjects were already well acquainted, began without loss of time to make the necessary preparations for his journey. In the month of April 568, he fet out with his whole nation, men, women, and children; carrying with them all their moveables. This promiscuous multitude arrived by the way of Istria; and advancing through the province of Venetia, found the whole country abandoned, the inhabitants having fled to the neighbouring iflands in the Adriatic. The gates of Aquileia were opened by the few inhabitants who had courage to flay : most of them, however, had fled with all their valuable effects; and among the rest the patriarch Paulinus, who had carried with him all the facred utenfils of the churches. From Aquileia, Alboinus proceeded to Forum Julii, of which he likewife became mafter without opposition. Here he spent the winter; during which time he erected Friuli into a dukedom, which

has continued ever fince. In 569, he made himself mafter of Trivini, Oderzo, Monte Selce, Vicenza, Verona, and Trent; in each of which cities he left a flrong garrison of Lombards under the command of an officer, whom he diftinguished by the title of duke : but these dukes were only officers and governors of cities, who bore the title no longer than the prince thought proper to continue them in their command or government. Padua and fome other cities Alboinus left behind him without attempting to reduce them, either because they were too well garrifoned, or because they lay too much out of his way. In 570, he entered Liguria. The inhabitants were fo terrified at his approach, that they left their habitations with fuch of their effects as they could carry off. and fled into the most mountainous and inacceffible parts of the country. The cities of Brefcia, Bargamo, Lodi, Como, and others quite to the Alps, being left almost without inhabitants, submitted of course; after which he reduced Milan, and was thereupon pro-

claimed king of Italy.

part of I-

But though the Lombards had thus conferred the title of king of Italy on their fovereign, he was by no means poffeffed of the whole country, nor indeed was it ever in the power of the Lombards to get possession of the whole. Alboinus having made himfelf malter of Venetia, Liguria, Æmilia, Hetruria, and Umbria, applied himfelf to legislation and the civilifation of his fubjects. But before he could make any progress in this work, he was taken off by the treachery of his wife; and Clephis, one of the nobles, chosen king in his flead. Clephis rebuilt fome cities which had been ruined during the wars between the Goths and Romans, and extended his conquefts to the very gates of Rome; but as he behaved both to the Romans and Lombards with the greatest cruelty, he was murdered, after a fhort reign of 18 months. His cruelty gave the Lombards fuch an aversion against regal power, that they changed their form of government, being governed only by their dukes for the space of ten years. During this interregnum, they proved fuccefsful in their wars with the Romans, and made themselves masters of feveral cities : but perceiving that their kingdom, thus divided, could not fubfift, they refolved once more to fubmit to the authority of one man; and accordingly, in 585, Authoris was chosen king of the

The great object of ambition to the new race of Lombard monarchs was the conqueft of all Italy; and Bubdued by this proved at laft the ruin of their empire by Charles Charlethe Great, as related under the article FRANCE, no 27. magne. As the Lombards, however, had not been possessed of the whole territory of Italy, fo the whole of it never came into the possession of Charlemagne : neither, fince the time of the Goths, has the whole of this country been under the dominion of any fingle flate. Some of the fouthern provinces were ftill poffeffed by the emperors of Constantinople; and the liberal grants of Pepin and Charlemagne himself to the pope, had invested him with a confiderable share of temporal power. The territories of the pope indeed were supposed to be held in vallalage from France; but this the popes themfelves always stiffly denied. The undifputed territory of Charlemagne in Italy, therefore, was restricted to

Piedmont, the Milanese, the Mantuan, the territory

of Genoa, Parma, Modena, Tufcany, Bologna, the Italy. dukedoms of Friuli, Spoleto, and Benevento; the last of which contained the greatest part of the present kingdom of Naples. The feudal government which the Lombards had in-

troduced into Italy, naturally produced revolts and commotions, as the different dukes inclined either to change their mafters or to fet up for themselves. Several revolts indeed happened during the life of Charlemagne himfelf; which, however, he always found means to crush: but after his death, the sovereignty of Italy became an object of contention between the kings of France and the emperors of Germany. That great monarch had divided his extensive dominions among his children; but they all died during his lifetime, except Louis, whom he affociated with himfelt in the empire, and who fucceeded to all his dominions after his death. From this time we may date the troubles with which Italy was fo long overwhelmed : and of which, as they proceeded from the ambition of those called kings of Italy and their nobles, of the kings of France, and of the emperors of Germany, it is difficult to have any clear idea. The following short sketch, however, may perhaps give fome fatisfaction on this perplexed fubiect.

At the time Louis the fon of Charlemagne was de-History of clared emperor of the West, Italy was held by Ber-the disturbnard the fon of Pepin, brother to Louis. Though this ances in I Bernard bore the title of king, yet he was only ac- the time of counted a vaffal of the emperor. His ambition, how-Charleever, foon prompted him to rebel against his uncle'; magne.

but being abandoned by his troops, he was taken prifoner, had his eyes pulled out, and died three days after. As the diffurbances still continued, and the nobles of Lombardy were yet very refractory, Lothaire, eldest fon to the emperor, was in the year 823 fent into Italy; of which country he was first crowned king at Rome, and aftewards emperor of the West, during his father's lifetime. But though his abilities were fufficient to have fettled every thing in a state of tranquillity, his unbounded ambition prompted him to engage in rebellion against his father; whom he more than once took prisoner; though in the end he was obliged to fubmit, and ask pardon for his offences, which was obtained only on condition of his not paffing the Alps without leave obtained from his father.

In the mean time, the Saracens, taking advantage of these intestine wars, landed on the coasts of Italy, and committed fuch ravages, that even the bishops were obliged to arm themselves for the defence of the country. Lothaire, however, after returning from his unnatural war with his father, was so far from attempting to put an end to these ravages, or to restore tranquillity, that he feized on fome places belonging to the fee of Rome, under pretence that they were part of his kingdom of Lombardy; nor would he forbear these encroachments till expressly commanded to do fo by his father. After having embroiled himfelf, and almost lost all his dominions, in a war with his brothers after the death of Louis, and declared his fon, also called Louis, king of Italy, this ambitious prince died, leaving to Louis the title of emperor as well as king of Italy, with which he had before invefted

Extent of his Italian dominions.

The new emperor applied himself to the restoration rengarius duke of Friuli, and Guido or Vido duke of Italy. of tranquillity in his dominions, and driving out the Saracens from those places which they had feized in Italy. This he fully accomplished, and obliged the infidels to retire into Africa; but in 875 he died without naming any fucceffor. After his death, fome of the Italian nobles, headed by the duke of Tufcany, represented to the pope, that as Louis had left no fucceffor, the regal dignity, which had fo long been usurped by foreigners, ought now to return to the I-talians. The pope, however, finding that Charles the Bald, king of France, had fuch an ambition for the imperial crown, that he would flick at nothing to obtain it, refolved to gratify him, though at as high a price as possible. He accordingly crowned him emperor and king of Lombardy, on condition of his owning the independency of Rome, and that he himself

only held the empire by the gift of the pope. This produced a conspiracy among the discontented nobles; and at the fame time the Saracens renewing their incursions, threatened the ecclesiastical territories with the utmost danger. The pope solicited the emperor's affiftance with the greatest earnest ness; but the latter died before any thing effectual could be done : after which, being diffressed by the Saracens on one hand, and the Lombard nobles on the other, the unhappy pontiff was forced to fly into France. Italy now fell into the utmost confusion and anarchy; during which time many of the nobles and states of Lombardy assumed an inde-

pendence, which they have ever fince retained. In 879, the pope was reconducted to Italy with an

army by Boson son-in-law to Louis II. of France: but though he inclined very much to have raifed this prince to the dignity of king of Italy, he found his interest infufficient for that purpose, and matters remained in their former fituation. The nobles, who had driven out the pope, were now indeed reconciled to him : but notwithstanding this reconciliation, the state of the country was worfe than ever; the great men renouncing the authority of any fuperior, and every one claiming to be fovereign in his own territories. To add to the calamities which enfued through the ambition of these despots, the Saracens committed every where the most terrible ravages; till at last the Italian nobles, despising the kings of the Carlovingian race, who had weakened themselves by their mutual dissentions, began to think of throwing off even all nominal fubmission to a foreign yoke, and retaining the imperial dignity among themselves. Thus they hoped, that, by being more united among themselves, they might be more able to refit the common enemy. Accordingly in 885 they went to pope Adrian; and requesting him to join them in afferting the independency of Italy, they obtained of him the two following decrees, viz. That the popes, after their election, might be confecrated without waiting for the presence of the king or his ambassadors; and that, if Charles the Gross died without fons, the kingdom of Italy, with the title of emperor, should be conferred on fome of the Italian nobles.

These decrees were productive of the worst consequences imaginable. The emperor complained of being deprived of his right; and the diffentions between the Italian nobles themselves became more fatal than ever. The two most powerful of these noblemen, Be-

Spoleto, entered into an agreement, that on the death of the emperor the former should feize on the kingdom of Italy, and the latter on the kingdom of France. Berengarius fucceeded without opposition; but Vido was disappointed, the French having already chosen Eudes or Otho for their king. Upon this he returned to Italy, and turned his arms against Berengarius. Vido proved victorious in an engagement, and drove his rival into Germany; where he fought the affiftance of Aruolphus, who had fuc-ceeded to the crown after the death of Charles. Having thus obtained the kingdom of Italy, Vido employed his time in reforming the abuses of the state. and confirming the grants formerly given to the pope, out of gratitude for his having fanctified his usurpation and declared him lawful king of Italy. This tran-quillity, however, was of thort duration. Arnolphus fent an army into Italy; the Saracens from Spain ravaged the northern parts of the country, and getting poffession of a castle near the Alps, held it for many years after, to the great diffress of the neighbouring parts, which were exposed to their continual incurfions; and at the fame time Benevento was believed and taken by the forces of the eaftern emperor, fo that Vido found his empire very confiderably circumfcribed

The new king, diffreffed by fo many enemies, affociated his fon Lambert with him in the government, and bribed the Germans to return to their own country. In 803, however, they again invaded Italy : but were fuddenly obliged to leave the country, after having put Berengarius in possession of Pavia. In the mean time, Vido died, and his fon Lambert drove ont Berengarius: but having joined a faction, headed by one Sergius, against pope Formosus, the latter offered the kingdom of Italy to Arnolphus; who thereupon entered the country with an army, befieged and took Rome, maffacring the faction of Sergius with the

most unrelenting cruelty.

Arnolphus thus mafter of Italy, and crowned emperor by the pope, began to form schemes of strengthening himfelf in his new acquifitions by putting out the eyes of Berengarius : but the latter having timely notice of this treachery, fled to Verona; and the Italians were fo provoked at this and the other cruelties of Arnolphus, that they drove him out of the country. His departure occasioned the greatest confusion at Rome. Formofus died foon after; and the fuccessors to the papal dignity, having now no army to fear, excited the greatest disturbances. The body of Formosus wasdug up and thrown into the Tiber by one pope; after which that pope was strangled, and Formosus's body buried again in the Vatican, by order of another. At last the coronation of Arnolphus was declared void, the Sergian faction entirely demolished, and the above mentioned decrees of Adrian were annulled; it being now determined that the elected popes should not be confecrated but in presence of the emperor or his ambassadors.

During these confusions Lambert enjoyed the kingdom in quiet; but the nobles hating him on account of his arbitrary and tyrannical government, began again to think of Berengarius. In the mean time, however, another faction offered the crown to Louis king of Arles. This new competitor entered Italy

to renounce his claim upon oath, and to swear that he would never again enter Italy, even though he should be invited to be crowned emperor .- This oath, however, was foon forgot. Louis readily accepted of another invitation, and was crowned king of Italy at Pavia in 901. The following year he forced Berengarius to fly into Bavaria; but having unadvifedly disbanded his army, as thinking himself now fecurely feated on the throne, Berengarius, who watched every opportunity, furprifed him at Verona, and put out

his eyes. Thus Berengarius at last became king of Italy without a rival; and held his kingdom for 20 years afterwards, without any opposition from his subjects, who at last became sensible of the mischies arising from civil discords. He was not yet, however, without troubles. The Hungarians invaded Italy with a formidable army, and advanced within a small distance of Pavia. Berengarins armed the whole force of his dominions; and came against them with such a multitude, that the Hungarians retired without venturing an engagement. A great many of their men were loft in paffing a river; upon which they fent deputies to Berengarius, offering to reftore all their booty, and never to come again into Italy, provided they were allowed a fafe retreat. These conditions were imprindently denied; upon which the Hungarians attacked the army of Berengarius in despair, and defeated them with great flaughter. After this they over-ran the whole country, and plundered the towns of Trevifo, Vicenza, and Padua, without relistance, the inhabitants flying every where into fortified places. This devastation they continued for two years; nor could their departure be procured without paying them a large fum of money : which, however, proved of little avail; for the following year they returned and ravaged the territory of Friuli without controul. Scarcely were these invaders departed, when the Saracens, who had fettled at the foot of the Alps, invaded Apulia and Calabria, and made an irruption as far as Acqui in the neighbourhood of Pavia; while the inhabitants, inflead of oppoling them, fled to fome forts which had been erected in the time of the first irruption of the Hungarians. In 912, however, John, presbyter of Ravenna, having attained the papal dignity by means of Theodora wife of Alderbert count of Tufcany, applied himfelf to regulate the affairs of the church, and to repress the insults of the Saracens. While he was confidering on the most proper methods of effecting this, one of the Saracens, who had received an injury from his countrymen, fled to Rome, and offered to deliver the Italians from their invasions, if the pope would but allow him a fmall conducted by the Saracen into by-paths, attacked the monk. infidels as they were returning from their inroads, and Nº 170.

with an army in 800; but was forced by Berengarius vento and Capua, fending at the fame time ambaffa- Italy. dors to Constantine the Greek emperor, inviting him to an alliance against the infidels. The Saracens, unable to withstand fuch a powerful combination, were belieged in their city: where being reduced to great ftraits, they at last fet fire to it, and fallied out into the woods; but being purfued by the Italians, they were all cut off to a man.

In this expedition it is probable that Berengarius gave great affiftance; for this very year, 915, he was crowned emperor by the pope. This gave displeasure to many of the ambitious nobles; conspiracies were repeatedly formed against him; in 922, Rodolphus king of Burgundy was crowned also king of Italy : and in 924, Berengarius was treacheroufly affaffinated at Verona; of which diffurbances the Hungarians taking the advantage, plundered the cities of Mantua. Brefcia, and Bergamo. Marching afterwards to Pa- 37 via, they invested it closely on all fides; and about the dered and middle of March 925, taking advantage of the wind, burnt by they fet fire to the houses next the walls, and during the Hungan the confusion broke open the gates, and getting pof rians. fession of the city treated the inhabitants with the greatest barbarity. Having burnt the capital of the kingdom, they next proceeded to Placenza, where

nonia laden with booty. The affairs of Italy now fell into the utmost confufion. A faction was formed against Rodolphus in fayour of Hugh count of Arles. The latter prevailed, and was crowned king at Pavia in 927. The Italians, however, foon repented of their choice. The Romans first invited him to be their governor, and then drove him out with difgrace; at the fame time choosing a conful, tribunes, &c. as if they had designed to affert their ancient liberty. One faction, in the mean time, offered the crown to Rodolphus, and the other to Arnold duke of Bavaria, while the Saracens

they plundered the fuburbs; and then returned to Pan-

took this opportunity to plunder the city of Genoa. Hugh, in the mean time, was not inactive. Having collected an army, he marched directly against Arnold, and entirely defeated him. Rodolphus delivered him from all apprehensions on his part, by entering into an alliance with him, and giving his daughter Adelaide in marriage to Lotharius, Hugh's fon. Being thus free from all danger from foreign enemies, he marched against the Romans; but with them he also came to an agreement, and even gave his daughter in marriage to Alberic, whom they had chosen conful. In the mean time the country was infelted by the Hungarians and Saracens, and at the same time depopulated by a plague. Endless conspiracies were formed against Hugh himself; and at last, in 947, he was totally deprived of the regal power by Berengabody of men. His proposals being accepted, 60 rius, grandson to the first king of that name; soon young men were chosen, all well armed; who being after which he retired into Burgundy, and became a

Though Berengarius was thus possessed of the fufeveral times defeated great parties of them. furious irruption; and Berengarius being unable to allow the pope's fupremacy in spiritual matters, plainly Italy. oppose them, was at last obliged to purchase their departure by money. In raising the sum agreed upon. however. Berengarius is faid to have been more opthe Hunga- preffive than even the Hungarians themselves. Every individual, without diffinction of age or fex, was obliged to pay fo much for their head, not excepting even the poor. The churches were likewise robbed; by which means the king raifed an immense sum of money. 10 bushels of which he gave to the Hungarians, but kept the much greater part to himfelf.

Berengarius, not yet satisfied, wanted to be put in poffession of Pavia, which was held by Adelaide, the widow of Lotharius. In order to obtain his purpose, he proposed a marriage between her and his son Adelbert. This proposal was rejected; upon which Be-rengarius besieged and took the city. The queen was confined in a neighbouring castle, from whence she made her escape by a contrivance of her confessor. With him and one semale attendant she concealed herfelf for fome days in a wood; but being obliged to remove from thence for want of food, the applied for protection to Adelard bishop of Reggio. By him she was recommended to his uncle Atho, who had a flrong cattle in the neighbourhood of Canoza. Here the was quickly belieged by Berengarius; upon which messengers were dispatched to Otho king of Germany, acquainting him, that, by expelling Berengarius, and marrying Adelaide, he might eafily obtain the kingdom of Italy. This proposal he readily accepted, and married Adelaide; but allowed Berengarius to retain the greatest part of his dominions, upon condition of his doing homage for them to the kings of Germany. He deprived him, however, of the dukedom of Friuli and marquifate of Verona, which he gave to Henry duke of Bavaria.

Berengarius, thus freed from all apprehension, not only oppressed his subjects in a most tyrannical manner, but revolted against Otho himself. This at last procured his ruin : for, in 961, Otho returned with an army into Italy, where he was crowned king by the archbishop of Milan; and the year following was crown. ed emperor by the pope. On this occasion he received the imperial crown from his holiness, and kissed his feet with great humility: after which they both went to the altar of St Peter, and bound themselves by a folemn oath, the pope to be always faithful to the emperor, and to give no affiftance to Berengarius or Adelbert his enemies; and Otho, to confult the welfare of the church, and to reflore to it all its patrimony granted by former emperors. Otho, belides this, beflowed very rich presents on the church of St Peter. He ordained that the election of popes should be according to the canons; that the elected pope should not be consecrated till he had publicly promised, in prefence of the emperor's commissaries, to observe every thing formerly specified with regard to the rights of the emperors; that these commissaries should constantly refide at Rome, and make a report every year how justice was administered by the judges; and in case of any complaints, the commiffaries should lay them bethe imperial commissionies might then do what they pleased.

Vol. IX. Part I.

affumed the fovereignty in temporals to himfelf; and thus Italy was for upwards of 300 years accounted a part of the German empire. The popes, however, by no means relished this superiority of the emperor-The latter was hardly departed, when the pope (John XII.) broke the oath which he had just before fworn with fo much folemnity; and entered first into an alliance with Adelbert count of Tufcany to expel the Germans, and then folicited the Hungarians to invade Italy. This treachery was foon punished by Otho. He returned with part of his army, and affembled a council of bishops. As the pope did not appear. Otho pretended great concern for his absence. The bishops replied, that the consciousness of his guilt made him afraid to show himself. The emperor then inquired particularly into his crimes; upon which the bishops accused him of filling the palace with lewd women, of ordaining a bishop in a stable, cafirating a cardinal, drinking the devil's health, &c. As the pope still refused to appear in order to justify He deposes himself from these charges, he was formally deposed; the popeand Leo the chief fecretary, though a layman, elected in his stead.

The new pope, in compliment to the emperor, granted a bull, by which it was ordained that Otho and his fucceffors should have a right of appointing the popes and investing archbishops and bishops: and that none should dare to confecrate a bishop without leave obtained from the emperor. Thus were the affairs of the Italians still kept in the utmost confusion even during the reigh of Otho I. who appears to have been a wife and active prince. He was no fooner gone, than the new pope was deposed, all his decrees annulled, and John replaced. The party of Leo was now treated with great cruelty : but John was foon stopped in his career; for about the middle of May, the same year (964) in which he had been reftored, being furprifed in bed with a Roman lady. he received a blow on the head from the devil (according to the authors of those times), of which he died eight days after. After his death a cardinal-deacon, named Benedia, was elected by the Romans, but deposed by Otho, and banished to Hamburgh.

The emperor was fcarce returned to Germany, when The Itahis fickle Italians revolted, and fent for Adelbert, who lians revolt; had fled to Corfica. But being foon reduced, they con-but are retinued quiet for about a year; after which they revolted again, and imprisoned the pope. Otho, however, provoked at their rebellious disposition, soon returned, and punished the rebels with great severity; after which he made feveral laws for the better regulation of the city of Rome, granted feveral privileges

to the Venetians, and caused his fon Otho, then only 13 years of age, to be crowned emperor.

This ceremony being over, Otho dispatched an ambaffador to Nicephorus, emperor of Constantinople, demanding his thep daughter Theophania in marriage for the young emperor; but upon this alliance being rejected, and that not without circumstances of the most atrocious perfidy, Otho instantly invaded the fore the pope; but if he neglected to intimate them, countries of Apulia and Calabria, and entirely defeated the Greek army in those parts. In the mean time. however, Nicephorus being killed, and his throne Thus we fee that Otho, however much he might usurped by John Zimisces, Otho immediately entered

Theophania for his fon. She was crowned with great them. folemnity on the 8th of April 060: at the fame time it is pretended by some authors, that the Greeks renounced their rights to Calabria and Apulia; though this is denied by others. After the celebration of this marriage, the emperor undertook an expedition against the Saracens, who still resided at the foot of the Alps; but being informed of the death of feveral nobles in Germany, he thought proper to return thither, where he died of an apoplexy in the year 973.

State of death of Otho.

At the time of Otho's death Italy was divided into Italy at the the provinces of Apulia, Calabria, the dukedom of Benevento, Campania, Terra Romana, the dukedom of spoleto, Tuscany, Romagna, Lombardy, and the marquifates of Acona, Verona, Friuli, Trevifo, and Genoa. Apulia and Calabria were still claimed by the Greeks; but all the reft were either immediately fubiect to, or held of, the kings of Italy. Otho conferred Benevento (including the ancient Samnium) on the duke of that name. Campania and Lucania he gave to the dukes of Capua, Naples, and Salerno. Rome with its territory, Ravenna with the exarchate, the dukedom of Spoleto, with Tufcany, and the marquifate of Ancona, he granted to the pope; and retained the rest of Italy under the form of a kingdom. Some of the cities were left free, but all tributary. He appointed feveral hereditary marquifates and coun. ties, but referved to himfelf the fovereign jurisdiction in their territories. The liberty of the cities confifted in a freedom to choose their own magistrates, to be judged by their own laws, and to dispose of their own revenues. on condition that they took the oath of allegiance to the king, and paid the cultomary tribute. The cities that were not free were governed by the commissaries or lieutenants of the emperor: but the free cities were governed by two or more confuls, afterwards called potestates, chosen annually who took the oath of allegiance to the emperor before the bifhop of the 'city or the emperor's commissary. The tribute exacted was called foderum, parata, et mansionaticum. By the foderum was meant a certain quantity of corn which the cities were obliged to furnish to the king when marching with an army or making a progress through the country; though the value of this was frequently paid in money. By the parata was underflood the expence laid out in keeping the public roads and bridges in repair; and the manfionaticum included those expences which were required for lodging the troops or accommodating them in their camp. Under pretence of this last article the inhabi tants were fometimes ftripped of all they poffeffed except their oxen and feed for the land. Belides regulating what regarded the cities, Otho distributed honours and poffessions to those who had served him faithfully. The honours confifted in the titles of duke, marquis, count, captain, valvafor, and valvafin; the possessions were, besides land, the duties arising from harbours, ferries, roads, fish-ponds, mills, falt-pits, the uses of rivers, and all pertaining to them, and fuch like. The dukes, marquifes, and counts, were those who received dukedoms, marquifates, and counties, from the king in fiefs; the captains had the command of a certain number of men by a grant from the king, duke, marquis, or count; the valvafors

into an alliance with the latter, and easily obtained were subordinate to the captains, and the valvasins to Italy,

No fooner was the death of Otho I. known in Italy, Great difthan, as if they had been now freed from all restraint, turbances the nobles declared war against each other : forme ci-happen on ties revolted, and chose to themselves consuls; while the the death of dominions of others were feized by the nobles, who Otho I, confirmed their power by erecting citadels. Rome especially was harassed by tumults, occasioned chiefly by the feditious practices of one Cincius, who pressed his fellow-citizens to reftore the ancient republic. As the pope continued firm in the interests of the emperor, Cincius caused him to be strangled by one Franco a cardinal deacon; who was foon after rewarded with the pontificate, and took upon him the name of Boniface VII. Another Pope was chosen by the faction of the count of Tufcany; who being approved by the emperor, drove Cincius and Boniface out of the city. Disturbances of a similar kind took place in other cities, though Milan continued quiet and loyal in the midit of all this uproar and confu-

In the mean time Boniface fled for refuge to Conflantinople, where he excited the emperor to make war against Otho II. In 979 an army was accordingly fent into Italy, which conquered Apulia and Calabria; but the next year Otho entered Italy with a formidable army; and having taken a fevere revenge on the authors of the diffurbances, drove the Greeks entirely out of the provinces they had feized. Having then caused his fon Otho III. at that time a boy of ten years of age to be proclaimed emperor, he died at Rome in the year 983. Among the regulations made by this emperor, one is very remarkable, and must give us a strange idea of the inhabitants of Italy at that time. He made a law, That no Italian (hould be believed upon his oath; and that in any dispute which could not be decided otherwise than by witnesses, the parties

should have recourse to a duel.

Otho III, fucceeded to the empire at twelve years of age; and during his minority the diffurbances in Italy revived. Cincius, called also Crescentius, renewed his scheme of restoring the republic. The pope (John XV.) oppofing his schemes, was driven out of the city; but was foon after recalled, on hearing that he had applied to the emperor for affiftance. A few years after Crescentius again revolted, and expelled Gregory V. the fuccessor of John XV ; raising to the papal dignity a creature of his own under the name of John XVI. Otho, enraged at this infult, Rome returned to Rome with a powerful army in 998, be-taken by fieged and took it by affault; after which he caused Ocho III. Crescentius to be beheaded, and the pope he had set up to be thrown headlong from the castle of St. Angelo, after having his eyes pulled out, and his note cut off. Four years after, he himself died of the small-pox; or, according to fome, was poiloned by the widow of Crescentius, whom he had debauched under a promise of marriage, just as he was about to punish the Romans. for another revolt.

Otho was succeeded in the imperial throne by Henry duke of Bavaria, and grandfon to Otho II. Henry had no fooner fettled the affairs of Germany, than he found it necessary to march into Italy against Ardonin marquis of Ivrea, who had affumed the title of King of Italy. Him he defeated in an engagement, and papal chair, which again required the presence of the emperor. Before he arrived, however, one of the competitors (Benedict VIII.) had got the better of his rival, and both Henry and his queen received the imperial crown from his hands. Before the emperor entered the church, the pope proposed to him the following question: "Will you observe your fidelity to me and my fucceffors in every thing?" To which, though a kind of homage, he submitted, and answered in the affirmative. After his coronation, he confirmed the privileges bestowed on the Roman see by his predeceffors, and added some others of his own; still, however, referving for himfelf the fovereignty and the power of fending commissaries to hear the grievances of the people. Having repelled the incursions of the Saracens, reduced fome more rebellions of his fubjects, and reduced the greatest part of Apulia and Calabria, he died in the year 1024.

The death of this emperor was, as usual, followed by a competition for the crown. Conrad being chosen emperor of Germany, was declared king of Italy by the archbishop of Milan; while a party of the nobles made offer of the crown to Robert king of France, or his fon Hugh. But this offer being declined, and likewise another to William duke of Guienne, Conrad enjoyed the dignity conferred on him by the archbishop without molestation. He was crowned king of Italy at Monza in 1026; and the next year he received the imperial crown from pope John XX in prefence of Canute the Great, king of England, Denmark, and Norway, and Rodolph III. king of Burgundy. His reign was fimilar to that of his predeceffors. The Italians revolted, the pope was expelled, the malecontents were fubdued, and the pope reitored; after which the emperor returned to Germany, and

died in 1039.

Under Henry III. who fucceeded Conrad, the difturbances were prodigiously augmented. Pope Sylcreafe nder vester II. was driven out by Benedict; who in his Henry III. turn was expelled by John bishop of Sabinum, who affumed the title of Sylvefler III. I hree months after Benedict was reftored, and excommunicated his rivals; but foon after religned the pontificate for a fum of money. In a fhort time he reclaimed it; and thus there were at once three popes, each of whom was fupported on a branch of the papal revenue, while all of them made themselves odious by the scandalous lives they led. At last a priest called Gratian put an end to this fingular triumvirate. Partly by artifice, and partly by prefents, he perfuaded all the three to renounce their pretenfions to the papacy; and the people of Rome, out of gratitude for fo fignal a fervice to the church, chofe him pope, under the name of Gregory VI. Henry III. took umbrage at this election, in which he had not been confulted, and marched with an army into Italy. He deposed Grepapal chair with his own chancellor Heidiger, bishop of Bamberg, who assumed the name of Clement II. and afterwards confecrated Henry and the empress Agnes. This ceremony being over, and the Romans by the address of Hildebrand, who waited on the emhaving fworn never to elect a pope without the appro- peror in person for that purpose, though he disdained

bation of the reigning emperor, Henry proceeded to Italy was himself crowned king of Italy at Pavia in 1005; Capua, where he was visited by Drago, Rainulphus, but a few years after, a new contest arose about the and other Norman adventurers; who leaving their country at different times, had made themselves mafters of great part of Apulia and Calabria, at the expence of the Greeks and Saracens. Henry entered He invests into treaty with them; and not only folemnly invested the Northem with those territories which they had acquired by mans with conquest, but prevailed on the pope to excommuni tories in cate the Beneventines, who had refused to open their Apulia and gates to him, and bestowed that city and its depend. Calabria. ences, as fiefs of the empire, upon the Normans, provided they took possession by force of arms. The emperor was scarce returned to Germany when he received intelligence of the death of Clement II. He was fucceeded in the apostolic see by Damasus II.; who also dying foon after his elevation, Henry nominated Bruno bishop of Toul to the vacant chair. This Bruno, who was the emperor's relation, immediately assumed the pontificals; but being a modest and pious prelate, he threw them off on his journey, by the perfuafion of a monk of Cluny, name Hildebrand, afterwards the famous Gregory VII. and went to Rome as a private man. "The emperor alone (faid Hildebrand) has no right to create a pope." He accompanied Bruno to Rome, and fecretly retarded his election, that he might arrogate to himself the merit of obtaining it. The scheme succeeded to his wish: Bruno, who took the name of Leo IX. believing himfelf indebted to Hildebrand for the pontificate, favoured him with his particular friendship and confidence; and hence originated the power of this enterprifing monk, of obscure birth, but boundless ambition, who governed Rome fo long, and whose zeal for the exaltation of the church occasioned so many troubles to Europe.

Leo foon after his elevation waited on the emperor at Worms, to crave affiltance against the Norman princes, who were become the terror of Italy, and treated their fubjects with great feverity. Henry furnished the pope with an army; at the head of which he marched against the Normans, after having excommunicated them, accompanied by a great number of bishops and other ecclelialtics, who were all either killed or taken prisoners, the Germans and Italians being totally routed. Leo himfelf was led captive to Benevento, which the Normans were now mafters of. and which Henry had granted to the pope in exchange for the fief of Bamberg in Germany; and the apollolic fee is to this day in possession of Benevento, by virtue of that donation. The Normans, however, who had a right to the city by a prior grant, restored it, in the mean time, to the princes of Lombardy; and Leo was treated with fo much respect by the conquerors, that he revoked the fentence of excommunication. and joined his fanction to the imperial inveltiture for the lands which they held in Apulia and Calabria. Leo died foon after his release; and the emperor about the fame time caused his infant fon, afterwards Henry IV. gory, as having been guilty of fimony; and filled the the famous Henry IV. to be declared king of the Ro-declared mans, a title ftill in use for the acknowledged heir of king of the the empire. Gebeliard, a German bishop, was elect-Romans. ed pope, under the name of Villor II. and confirmed

Bb 2

to confult him beforehand. Perhaps Hildebrand would not have found this task so easy, had not Henry been involved in a war with the Hungarians, who preffed him hard, but whom he obliged at last to pay a large tribute, and furnish him annually with a certain number of fighting men.

As foon as the emperor had finished this war and others to which it gave rife, he marched into Italy to inspect the conduct of his fifter Beatrice, widow of Boniface marquis of Mantua, and made her prifoner. She had married Gozelo, duke of Lorrain, without the emperor's confent; and contracted her daughter Matilda, by the marquis of Mantua, to Godfrey duke of Spoleto and Tuscany, Gozelo's fon by a former marriage. This formidable alliance juftly alarmed Henry; he therefore attempted to diffolve it, by carrying his fifter into Germany, where he died foon after his return, in the 30th year of his age, and the 16th of his reign.

This emperor, in his last journey to Italy, concluded an alliance with Contarini, doge of Venice. That republic was already rich and powerful, though it had only been enfranchifed in the year 998, from the tribute of a mantle of cloth of gold, which it formerly paid, as a mark of fubjection to the emperors of Constantinople. Genoa was the rival of Venice in power and in commerce, and was already in possession of the island of Corfica which the Genoese had taken from the Saracens. These two cities ingroffed at this time almost all the trade of Europe. There was no city in any respect equal to them either in France or Ger-

Henry IV. was only five years old at his father's death. The popes made use of the respite given them by his minority, to shake off in a great measure their dependence upon the emperors. After a variety of contests about the pontificate, Nicholas II. a creature of Hildebrand's, was elected; who, among others, paffed the following celebrated decree, viz. That for the future, the cardinals only should elect the pope; and that the election should afterwards be confirmed by the rest of the clergy and the people, "faving the bonour (adds he) due to our dear fon Henry, now king; and who, if it please God, shall be one day emperor, according to the right which we have already conferred upon him." After this he entered into a treaty with the Norman princes above mentioned; who, though they had lately fworn to hold their poffessions from the emperor, now fwore to hold them from the pope; and hence arose the pope's claim of sovereignty over the kingdom of Naples and Sicily.

Thus was the power of the German emperors in Italy greatly diminished, and that of the popes proportionally exalted; of which Henry foon had fufficient evidence. For having affumed the government into his own hands in the year 1072, being then 22 His contest years of age, he was fummoned by Alexander II. to appear before the tribunal of the holy fee, on account of his loofe life, and to answer the charge of having exposed the investiture of bishops to sale; at the fame time that the pope excited his German subjects to rebel against him. The rebels, however, were defeated, and peace was restored to Germany: but foon after, Hildebrand above mentioned being elected to the pontificate under the name of Gregory VII.

openly affumed the fuperiority over every earthly mo-

narch whatever. He began with excommunicating every ecclefiaftic who should receive a benefice from the hands of a layman, and every layman who should take upon him to confer fuch a benefice. Henry, inflead of refenting this infolence, submitted, and wrote a penitential letter to the pope; who, upon this, condescended to take him into favour, after having severely reprimanded him for his loofe life; of which the emperor now confessed himself guilty.

The quarrel between the church and the emperor was, however, foon brought to a crifis by the following accident. Solomon, king of Hungary, being deposed by his brother Geysa, had fled to Henry for protection, and renewed the homage of Hungary to the empire. Gregory, who favoured Geyfa, exclaimed against this act of submission; and said in a letter to Solomon, "You ought to know that the kingdom of Hungary belongs to the Roman church; and learn that you will incur the indignation of the holy fee, if you do not acknowledge that you hold your dominions of the pope and not of the emperor." Henry, though highly provoked at this declaration, thought proper to treat it with neglect; upon which Gregory refumed the dispute about investitures. The predeceffors of Henry had always enjoyed the right of nominating bishops and abbots, and of giving them inveftiture by the crofs and the ring. This right they had in common with almost all princes. The predeceffors of Gregory VII. had been accustomed, on their part, to feud legates to the emperors, in order to intreat their affiftance, to obtain their confirmation, or defire them to come and receive the papal fanction, but for no other purpole. Gregory, however, fent two legates to fummon Henry to appear before him as a delinquent, because he still continued to bestow investitures, notwithstanding the apostolic decree to the contrary; adding, that if he should fail to yield obedience to the church, he must expect to be excommunicated and dethroned. Incenfed at this arrogant meffage from one whom he confidered as his vaffal, Henry difmiffed the legates with very little ceremony, and in 1706 convoked an affembly of all the princes and dignified ecclefiaftics at Worms; where, after ma- The empeture deliberation, they concluded, that Gregory ha- ror depofes ving usurped the chair of St Peter by indirect means, the pope, infected the church of God with a great many novelties and abuses, and deviated from his duty to his sovereign in feveral fcandalous attempts, the emperor, by that fupreme authority derived from his predeceffors, ought to divet him of his dignity, and appoint another in his place. In confequence of this determination, Henry fent an ambaffador to Rome, with a formal deprivation of Gregory; who, in his turn, convoked a council, at which were prefent 110 bishops, who unanimoufly agreed that the pope had just cause to depose Henry, to dissolve the oath of allegiance which the princes and states had taken in his favour, and to prohibit them from holding any correspondence with him on pain of excommunication; which was immediately fulminated against the emperor and his adhe- And he tha rents. to fubmit.

cular letters written by this pontiff breathe the fame fpirit with his fentence of deposition. He there repeats feveral times, that "bishops are superior to kings, and made to judge them !" expressions alike artful and prefumptuous, and calculated for bringing in all the churchmen of the world to his standard.

Gregory knew well what confequences would follow the thunder of the church. The German bishops came immediately over to his party, and drew along with them many of the nobles: the flame of civil war ftill lay fmothering, and a bull properly directed was fufficient to fet it in a blaze. The Saxons, Henry's old enemies, made use of the papal displeasure as a pretence for rebelling against him. Even Guelfe, to whom the emperor had given the duchy of Bavaria, supported the malecontents with that power which he owed to his fovereign's bounty: nay, those very princes and prelates who had affitted in depofing Gregory, gave up their monarch to be tried by the pope; and his holiness was solicited to come to Augsburg for that

purpofe.

Willing to prevent this odious trial at Augsburg, Henry took the unaccountable refolution of fuddenly paffing the Alps at Tirol, accompanied only by a few domestics, to ask absolution of Pope Gregory his oppressor; who was then in Canoza, on the Apennine mountains, a fortress belonging to the countess or Who is at last obliged duchess Matilda above mentioned. At the gates of this place the emperor prefented himfelf as an humble penitent. He alone was admitted without the outer court; where, being stripped of his robes, and wrapped in fack cloth, he was obliged to remain three days, in the month of January, bare-footed and fafting, before he was permitted to kifs the feet of his holiness; who all that time was shut up with the devout Matilda. whose spiritual director he had long been, and, as some fay, her gallant. But be that as it may, her attachment to Gregory, and her hatred to the Germans, was fo great, that she made over all her estates to the apostolic fee; and this donation is the true cause of all the wars which fince that period have raged between the emperors and the popes. She possessed in her own right great part of Tuscany, Mantua, Parma, Reggio, Placentia, Ferrara, Modena, Verona, and almost the whole of what is now called the patrimony of St Peter, from Viterbo to Orvieto; together with part of Umbria, Spoleto, and the Marche of Ancona.

The emperor was at length permitted to throw himfelf at the pontiff's feet; who condescended to grant him absolution, after he had fworn obedience to him in all things, and promifed to fubmit to his folemn decision at Augsburg: so that Henry got nothing but difgrace by his journey; while Gregory, elated by his triumph, and now looking upon himfelf (not altogether without reason) as the lord and master of all the crowned heads in Christendom, faid in several of his letters, that it was his duty " to pull down the pride

of kings."

This extraordinary accommodation gave much difguft to the princes of Italy. They never could forgive the infolence of the pope, nor the abject humility of the emperor. Happily, however, for Henry, their indignation at Gregory's arrogance overbalanced their deteflation of his meannefs. He took advantage of this temper; and by a change of fortune, hitherto unknown to the German emperors, he found a firong party in Italy, when abandoned in Germany. All Lombardy took up arms against the pope, while he was raising all Germany against the emperor. Gregory, on the other hand, made use of every art to get another emperor elected in Germany; and Henry, on his part, left nothing undone to perfuade the Italians to elect another pope. The Germans chofe Rodolph, duke of Suabia, Rodolph who was folemnly crowned at Mentz; and Gregory, chosen em-

hefitating on this occasion, behaved truly like the fu-peror of preme judge of kings. He had deposed Henry, but ftill it was in his power to pardon that prince: he therefore affected to be displeased that Rodolph was confecrated without his order; and declared, that he would acknowledge as emperor and king of Germany, him of the two competitors who should be most submis-

five to the holy fee.

Henry, however, trufting more to the valour of his troops than to the generofity of the pope, fet out immediately for Germany, where he defeated his enemies in feveral engagements: and Gregory, feeing no hopes of fubmiffion, thundered out a fecond fentence of excommunication against him, confirming at the same time the election of Rodolph, to whom he fent a golden crown, on which the following well-known verfe, equally haughty and puerile, was engraved:

Petra dedit Petro, Petrus diadema Rodolpho.

This donation was also accompanied with a most enthufiastic anathema against Henry. After depriving him of frength in combat, and condemning him never to be victorious, it concludes with the following remarkable apostrophe to St Peter and St Paul : " Make all men fenfible, that as you can bind and loofe every thing in heaven, you can also upon earth take from or give to every one, according to his deferts, empires, kingdoms, principalities-let the kings and the princes of the age then instantly feel your power, that they may not dare to despise the orders of your church; let your justice be so speedily executed upon Henry, that nobody may doubt but he falls by your means, and not by chance." In order to avoid the effects of this fecond excom-

munication, Henry affembled at Brixen, in the county of Tirol, about 20 German bishops: who acting also for the bishops of Lombardy, unanimously resolved, that the pope, instead of having power over the emperor, owed him obedience and allegiance; and that Gregory VII. having rendered himself unworthy of the papal chair by his conduct and rebellion, ought to be deposed from a dignity he so little deserved. They accordingly degraded Hildebrand; and elected in his room Guibert, archbishop of Ravenna, a person of undoubted merit, who took the name of Clement 111. Henry promifed to put the new pope in possession of Rome: but he was obliged, in the mean time, to employ all his forces against his rival Rodolph, who had reaffembled a large body of troops in Saxony. The two armies met near Mersburg, and both fought with Defe great fury ; but the fortune of the day feemed inclined and killeds to Rodolph, when his hand was cut off by the famous Godfrey of Bouillon, then in the service of Henry, and afterwards renowned for his conquest of Jerusalem. Discouraged by the misfortune of their chief, the rebels immediately gave way; and Rodolph perceiving his end approaching, ordered the hand that was cuthe) the hand with which I took the oath of allegiance to Henry; and which oath, at the inftigation of Rome, I have violated, in perfidiously afpiring at an

honour that was not my due."

Thus delivered from this formidable antagonist, Henry foon difperfed the rest of his enemies in Germany, and fet out for Italy in order to fettle Clement in the papal chair. But the gates of Rome being shut against him, he was obliged to attack it in form. The fiege continued upwards of two years; Henry during that time being obliged to quell fome infurrections in Henry IV. Germany. The city was at length carried by affault, and with difficulty faved from being pillaged; but Gregory was not taken: he retired into the caftle of St Angelo, and thence defied and excommunicated the conqueror. The new pope was, however, confecrated with the usual ceremonies; and expressed his gratitude by crowning Henry, with the concurrence of the Roman fenate and people. Mean while the fiege of St Angelo was going on; but the emperor borrowed from the Scripture, were worthy of the quity; therefore I die in exile!" Henry, however, did not enjoy all the advantages

which might have been expected from the death of their predecessor. In 1101, Pascal II. excited young Henry to rebel against his father. The emperor did all in his power to diffuade him from proceeding to Henry; which not fuceeding, he excommunicated extremities, but in vain. The young prince perfifted in his rebellious intentions; and having by feigned fubmiffions prevailed on the emperor to difband his army, he treacherously feized and confined him. Henry, however, found means to escape from his confinement, and attempted to engage all the fovereigns of Europe in his quarrel; but before any thing effectual could be done, he died at Liege in the year

Difpute bepope and

Rome taken by

1106. The dispute about investitures was not terminated tween he by the deposition and death of Henry IV. His fon Henry V. purfued the very fame conduct for which he had deposed his father. Pascal opposed him with violence; upon which Henry gave him an invitation into king of France, who undertook to mediate between communities and chapters at liberty to fill up their the contending parties. His mediation, however, own vacancies, without beltowing inveftitures with the proved ineffectual, and Henry was prevented by the crofs and ring; that he should restore all that he had wars in Hungary and Poland from paying any further unjustly taken from the church; that all elections attention to the affair of investitures. At last, having should be made in a canonical manner, in presence fettled his affairs in Germany, he took a refolution of of the emperor or his commissaries: and whatever difgoing to Rome, in order to fettle the dispute perfo- putes might happen, should be referred to the decision nally with the pope. To give his arguments the of the emperor, affilted by the metropolitan and his greater weight, however, he marched at the head of fuffragrans; that the person elected should receive from an army of 80,000 men. Pafcal received him with the emperor the inveftiture of the fiefs and fecular great appearance of friendship, but would not renounce rights, not with the crofs, but with the feeptre; and the claim of inveltitures; and Henry, finding himfelf should pay allegiance to him for these rights only. deceived in his expectations, ordered the pope to be

Italy. off to be brought him, and made a freech to his offi- feized. The conful put the citizens in arms to defend cers on the occasion, which could not fail to have an the pope, and a battle was fought within the walls of influence on the emperor's affairs. "Behold (faid Rome. The flaughter was so great, that the waters of the Tiber were tinged with blood. The Romans were defeated, and Pascal was taken prisoner. The latter renounced his right of investiture; folemnly fwore never to refume it, and broke his oath as foon as Henry was gone, by fulminating the fentence of excommunication against him. In 1114 died the countefs Matilda, who had bequeathed all her dominions to the pope, as we have already observed; but Henry thinking himfelf the only lawful heir, alleged, that it was not in Matilda's power to alienate her estates, which depended immediately on the empire. He therefore fet out for Lombardy, and fent ambaffadors to the pope, befeeching him to revoke the fentence of excommunication abovementioned. Pafcal, however, would not even favour the ambaffadors with an audience; but dreading the approach of Henry himself, he took refuge among the Norman princes in Apulia. Henry arrived at Rome in 1117; but being foon after obliged to leave it in order to fettle some affairs in Tuscany, the pope returned to Rome, but being called about fome affairs into Lombardy, Robert died in a few days. On the third day after his de-Guifcard took advantage of his abfence to release Gre- cease, cardinal Cajetan was elected his successor, withgory, who died foon after at Salerno. His last words, out the privity of the emperor, under the name of Gelasius II. The new pope was instantly deposed by greatest faint: "I have loved justice, and hated ini- Henry; who set up the archbishop of Prague, under the name of Gregory VIII. Gelafius, though inpported by the Norman princes, was obliged to take refuge in France, where he died; and the archbishop Gregory. The fubfequent popes trod in the paths of of Vienna was elected by the cardinals then prefent under the name of Calixtus II.

The new pope attempted an accommodation with the emperor, the antipope, and his adherents. He next set out for Rome, where he was honourably re-ceived; and Gregory VIII. was forced to retire to Sutri, a drong town garrifoned by the emperor's troops. Here he was belieged by Calixtus and the Norman princes. The city was foon taken, and Gregory thrown into prison by his competitor; but at laft, the flates of the empire being quite wearied out with fuch a long quarrel, unanimously fupplicated Henry for peace. He referred himself entirely to their decision; and a diet being assembled at Wurtzburg, it was decreed that an embaffy should be immediately fent to the pope, defiring that he would convoke a general council at Rome, by which all disputes Germany, to end the dispute in an amicable manner. might be determined. This was accordingly done, and Determina-Pafcal did not think proper to accept of this invita- the affair of inveftitures at length regulated in the fol-tion of the tion; but put himself under the protection of Philip I. lowing manner, viz. That the emperor should leave the veltitures king of France, who undertook to mediate between communities and chapters at bloom to fill under the fill unde

After the death of Henry, the usual diforders took

place

place in Italy; during which, Roger duke of Apulia conquered the island of Sicily, and assumed the right of creating popes, of whom there were two at that time, viz. Innocent II. and Anacletus. Roger drove out the former, and Lothario emperor of Germany the latter, forcing Roger himfelf at the fame time to retire into Sicily. The emperor then conducted Inpocent back to Rome in triumph; and having fubdued all Apulia, Calabria, and the rest of Roger's Italian dominions, erected them into a principality, and beflowed it, with the title of duke, upon Renaud a Ger-

man prince, and one of his own relations. In the reion of Conrad III, who fucceeded Lotha-

58 Italy in-

rio, the celebrated factions called the Guelphs and Gibelines*, arofe, which for many years deluged the Gudphs and cities of Italy with blood. They took their origin during a civil war in Germany, in which the enemies of the emperor were flyled Guelphs, and his friends Gibelines ; and these names were quickly received in Italy as well as other parts of the emperor's dominions. Of this civil war many of the cities in Italy took the advantage to fet up for themselves; neither was it in the power of Conrad, who during his whole reign was employed in unfuccefsful crufades, to reduce them; but in 1158 Frederic Barbaroffa, fucceffor to Conrad, entered Italy at the head of a very numerous and well disciplined army. His army was divided into fe-Barbaroffa. veral columns for the conveniency of entering the country by as many different routes. Having passed the Alps, he reduced the town of Brefcia; where he made feveral falutary regulations for the prefervation advance, he befieged Milan, which turrendered at difcretion. He was crowned king of Lombardy at Monza; and having made himself matter of all the other cities of that country, he ordered a minute inquiry to be fet on foot concerning the rights of the empire, and exacted homage of all those who held of it, without excepting even the bishops. Grievances were redreffed; magistracics reformed; the rights of for the maintenance of public tranquillity and the encouragement of learning, which now began to revive in the school of Bologna; and, above all, subvassals were not only prohibited from alienating their lands, but also compelled, in their oath to their lords paramount, to except the emperor nominally, when they fwore to ferve and affift them against all their enemies. The pope took umbrage at this behaviour towards the telling his deputies it was but reasonable they should do homage for the fiels they poffeffed; as Jefus Chritt himfelf, though the lord of all the foverrighs upon earth, had deigned to pay for himself and St Peter the

> Frederic having fent commissaries to superintend the election of new magistrates at Milan, the inhabitants were fo much provoked at this intriguement of their old privileges, that they infulted the imperialits, revolted, and refuted to appear before the emperor's tribunal. This he highly refented, and refolved to chaftife them severely: for which purpose he sent for a reinforcement from Germany, which foon after arrived with the empress, while he immelf ravaged Liguria,

declared the Milanese rebels to the empire, and plun- Italy. dered and burnt the city of Crema which was in alliance with that of Milan. In the mean time, pope Adrian IV. dying, two

opposite factions elected two perfons known by the

names of Villor II. and Alexander III. The empe-

ror's allies necessarily acknowledged the pope chosen by him; and those princes who were jealous of the emperor, acknowledged the other. Victor II. Frederic's pope, had Germany, Bohemia, and one half of Italy, on his fide; while the rest fubmitted to Alexander III. The emperor took a fevere revenge on his He takes enemies; Milan was razed from the foundation, and and defalt strewed on its ruins; Brescia and Placentia were lan, &c. difmantled; and the other cities which had taken part with them were deprived of their privileges. Alexander III. however, who had excited the revolt, returned to Rome after the death of his rival; and at his return the civil war was renewed. The emperor caufed another pope, and after his death a third, to be elected. Alexander then fled to France, the common afylum of every pope who was oppressed by the emperors; but the flames of civil difeord which he had raifed continued daily to spread. In 1168, the cities of Italy, supported by the Greek emperor and the king of Sicily, entered into an affociation for the defence of their liberties; and the pope's party at length prevailed. In 1176, the imperial army, worn out by fatigues and difeafes, was defeated by the confederates, and Frederic himself narrowly escaped. About the fame time, he was defeated at fea by the Venetians's and his eldeft fon Henry, who commanded his fleet, fell into the hands of the enemy. The pope, in honour of this victory, failed out into the open fea, accompanied by the whole fenate; and after having pronounced a thoufand benedictions on that element, threw into it a ring as a mark of his gratitude and affection. Hence the origin of that ceremony which is annually performed by the Venetians, under the notion of espoufing the Adriatic. These misfortunes disposed the

was the place appointed for a reconciliation. The em- Submits peror, the pope, and a great many princes and cardi- to the pope, nals, attended; and there the emperor, in 1177, put an end to the difpute, by acknowledging the pope, killing his feet, and holding his ftirrup while he mounted his mule. This reconciliation was attended with the submission of all the towns of Italy which had entered into an affociation for their mutual defence. They obtained a general pardon, and were left at liberty to use their own laws and forms of government, but were obliged to take the oath of allegiance to the emperor as their fuperior lord. Calixtus, the antipope, finding himfelf abandoned by the emperor in confequence of this treaty, made also his submission to Alexander, who received him with great humanity; and in order to prevent for the future those diffurbances which had fo often attended the elections of the popes, he called a general council, in which it was

emperor towards a reconciliation with the pope : but,

reckoning it below his dignity to make an advance, he

rallied his troops, and exerted himfelf with fo much

vigour in repairing his lofs, that the confederates were

defeated in a battle; after which he made propofals of

peace, which were now joyfully accepted, and Venice

decreed.

Italy.

ted without having two-thirds of the votes in his fa-

The affairs of Italy being thus fettled, Barbaroffa returned to Germany; and having quieted fome difturbances which had arisen during his absence in Italy, at last undertook an expedition into the Holy Land: where having performed great exploits, he was drowned as he was fwimming in the river Cydnus, in the year 1100. He was succeeded by his fon Henry VI. who at the fame time became heir to the dominions of Sicily by the right of his wife, daughter of William king of that country. After fettling the affairs of Germany, the new emperor marched with an army into Italy, in order to be crowned by the pope, and to recover the fuccession of Sicily, which was usurped by Tancred his wife's natural brother. For this purpose, he endeavoured to conciliate the affections of the Lombards, by enlarging the privileges of Genoa, Pifa and other cities, in his way to Rome; where the ceremony of the coronation was performed by Celeftin III. on the day after Eafter in the year 1191. The pope, then in the 86th year of his age, had no fooner placed the crown upon Henry's head than he kicked it off again, as a testimony of the power reliding in the fovereign pontiff to make and unmake emperors at his pleafure.

The coronation being over, Henry prepared for the conquest of Naples and Sicily; but in this he was opposed by the pope: for though Celestin considered l'ancred as an usurper, and defired to see him deprived of the crown of Sicily, which he claimed as a fief of the fee, yet he was much more averse to the emperor's being put in possession of it, as that would render him too powerful in Italy for the interest of the church. Henry, however, without paying any regard to the threats and remonstrances of his holiness, took almost all the towns of Campania, Calabria, and Apulia; invested the city of Naples; and fent for the Genoese fleet, which he had before engaged, to come and form the blockade by fea: but before its arrival, he was obliged to raife the fiege, in confequence of a dreadful mortality among his troops: and all future attempts upon Sicily were ineffectual during the life of Tan-

The whole reign of Henry from this time feems to have been a continued train of the most abominable perfidies and cruelties. Having treacherously seized and imprisoned Richard I. of ENGLAND, in the manner related under that article, no 128-130. he had no fooner received the ranfom paid for his royal captive, than he made new preparations for the conquest of Sicily. As Tancred died about this time, the emperor, with the affishance of the Genoese, accomplished his The queen-dowager furrendered Salerno, and her right to the crown, on condition that her fon William should possess the principality of Tarentum; but Henry no fooner found himself master of the place, than he ordered the infant king to be castiated, to have his eyes put out, and to be confined in a dungeon. The royal treasure was transported to Germany, and the queen and her daughter confined in a convent.

In the mean time, the empress, though near the age of 50, was delivered of a fon, named Frederic; and No 170.

decreed, that no pope should be deemed duly elec- Henry soon after assembled a diet of the princes of Germany, to whom he explained his intentions of rendering the imperial crown hereditary, in order to prevent those disturbances which usually attended the election of emperors. A decree passed for this purpose : and Frederic, yet in his cradle, was declared king of the Romans. Soon after, the emperor being folicited to undertake a crusade, obeyed the injunctions of the pope, but in fuch a manner as to make it turn out to his own advantage. He convoked a general diet at Worms, where he folemnly declared his refolution of employing his whole power, and even of hazarding his life, for the accomplishment of fo holy an enterprife; and he expatiated upon the subject with fo much eloquence, that almost the whole affembly took the crofs. Nay, fuch multitudes from all the provinces of the empire enlitted themselves, that Henry divided them into three large armies; one of which, under the command of the bishop of Mentz, took the route of Hungary, where it was joined by Margaret, queen of that country, who entered herself in this pious expedition, and actually ended her days in Palefline: the fecond was affembled in Lower Saxony, and embarked in a fleet furnished by the inhabitants of Lubec, Hamburg, Holltein, and Friezland: and the emperor in person conducted the third into Italy, in order to take vengeance on the Normans in Naples and Sicily who had rifen against his government.

The rebels were humbled; and their chiefs were condemned to perish by the most excruciating tortures. One Jornandi, of the house of the Norman princes, was tied naked on a chair of red hot iron, and crowned with a circle of the same burning metal, which was nailed to his head. The empress, shocked at such cruelty, renounced her faith to her husband, and encouraged her countrymen to recover their liberties. Refolution fprung from defpair. The inhabitants betook themselves to arms; the empress Constantia headed them; and Henry, having difmiffed his troops, no longer thought necessary to his bloody purposes, and fent them to purfue their expedition to the Holy Land, was obliged to fubmit to his wife, and to the conditions which she was pleased to impose on him in favour of the Sicilians. He died at Messina in 1107. foon after this treaty; and, as was supposed, of poi-

for administered by the empress.

The emperor's fon Frederic had already been de-Diffurbanclared king of the Romans, and confequently became ces in the emperor on the death of his father; but as Frederic II. beginning was yet a minor, the administration was committed to reign of his uncle the duke of Suabia, both by the will of Frederic II. Henry and by an affembly of the German princes. Other princes, however, incenfed to fee an elective empire become hereditary, held a new diet at Cologne, and chose Otho duke of Brunswick, son of Henry the Lion. Frederic's title was confirmed in a third affembly, at Arnsburg; and his uncle, Philip duke of Suabia, was elected king of the Romans, in order to give greater weight to his administration. These two elections divided the empire into two powerful factions, and involved all Germany in ruin and defolation. Innocent III. who had fucceeded Celeftin in the papal chair, threw himfelf into the scale of Otho, and ex-

communicated Philip and all his adherents. This able

and ambitious pontiff was a fworn enemy of the house

62 cruckty. Italy.

of Suabia; not from any perfonal animofity, but out of a principle of policy. That house had long been terrible to the popes, by its continual possession of the imperial crown; and the accession of the kingdom of Naples and Sicily made it still more to be dreaded: Innocent, therefore, gladly feized the prefent favourable opportunity for divefting it of the empire, by fupporting the election of Otho, and fowing divisions among the Suabian party. Otho was also patronised by his uncle, the king of England; which naturally inclined the king of France to the fide of his rival. Faction clashed with faction; friendship with interest; caprice, ambition, or refentment, gave the sway; and nothing was beheld on all hands but the horrors and

the miferies of civil wars.

Meanwhile, the empress Constantia remained in Sicily, where all was peace, as regent and guardian for her infant fon Frederic II. who had been crowned king of that island, with the consent of pope Celeftin III. But she also had her troubles. A new inveftiture from the holy fee being necessary, on the death of Celeftin, Innocent III. his fucceffor, took advantage of the critical fituation of affairs for aggrandizing the papacy, at the expence of the kings of Sicily. They poffeffed, as has been already observed, the privilege of filling up vacant benefices, and of judging all ecclefiaftical causes in the last appeal : they were really popes in their own island, though vassals of his holinefs. Innocent pretended that thefe powers had been furreptitionfly(obtained; and demanded, that Constantia should renounce them in the name of her fon, and do liege, pure and fimple homage for Sicily. But before any thing was fettled relative to this affair, the empress died, leaving the regency of the kingdom to the pope; fo that he was enabled to prescribe what conditions he thought proper to young Frederic. The troubles of Germany still continued; and the pope redoubled his efforts, to detach the princes and prelates from the cause of Philip, notwithstanding the remonfirances of the king of France, to whom he proudly replied, " Either Philip must lose the empire, or I the papacy." But all these diffentions and troubles in Europe did not prevent the formation of another crufade, or expedition into Asia, for the recovery of the Holy Land. Those who took the cross were principally French and Germans: Baldwin, count of Flanders, was their commander; and the Venetians, as greedy of wealth and power as the ancient Carthaginians, furnished them with ships, for which they took care to be amply paid both in money and territory. The Christian city of Zara, in Dalmatia, had withdrawn itself from the government of the republic : the army of the cross undertook to reduce it to obedience; and it was belieged and taken, notwithstanding the threats and excommunications of the pope.

While the crufaders were fpreading defolation through the east, Philip and Otho were in like manner defolating the west. At length Philip prevailed; and Otho, obliged to abandon Germany, took refuge in England. Philip, elated with success, confirmed his election by a fecond coronation, and proposed an accommodation with the pope, as the means of finally establishing his throne; but before it could be brought about, he fell a facrifice to private revenge, being affaf-

Vol. IX. Part I.

ter he had promised to marry, and afterwards rejected. Italy. Otho returned to Germany on the death of Philip; married that prince's daughter; and was crowned at Rome by pope Innocent III, after yielding to the holy fee the long disputed inheritance of the countess Matilda, and confirming the rights and privileges of the Italian cities. But these concessions, as far at least as regarded the pope, were only a facrifice to prefent policy: Otho, therefore, no fooner found himself in a condition to act offenfively, than he refumed his grant; and in 1210 not only recovered the possessions of the empire, but made hoftile incursions into Apulia, ravaging the dominions of young Frederic king of Naples and Sicily, who was under the protection of the holy fee. For this reason he was excommunicated by Innocent; and Frederic, now 17 years of age, was elected emperor by a diet of the German princes. Otho, however, on his return to Germany, finding his party ftill confiderable, and not doubting but he should be able to humble his rival by means of his fuperior force, entered into an alliance with his uncle John king of England, against Philip Augustus king of France, A. D. 1213. The unfortunate battle of Bouvines, where the confederates were defeated, completed the fate of Otho. He attempted to retreat into Germany, but was prevented by young Frederic; who had marched into the empire at the head of a powerful army, and was every where received with open arms. Thus abandoned by all the princes of Germany, and altogether without recourse. Otho retired to Brunfwick, where he lived four years as a private man, dedicating his time to the duties of religion.

Frederic II. being now univerfally acknowledged emperor, was crowned at Aix la-Chapelle in 1215, with great magnificence; when, in order to preferve the favour of the pope, he added to the other folemnities of his coronation a vow to go in person to the Holy Land.

The bad fuccess of this expedition hath been already taken notice of under the article CROISADE. The emperor had, on various pretences, refused to go into the east; and in 1225, the pope, incensed at the loss of Damietta, wrote a fevere letter to him, taxing him His quarrel with having facrificed the interests of Christianity by with the delaying fo long the performance of his vow, and pope. threatening him with immediate excommunication if he did not infantly depart with an army into Afia. Frederic, exasperated at these reproaches, renounced all correspondence with the court of Rome; renewed his eeclefiaftical jurifdiction in Sicily; filled up vacant fees and benefices; and expelled fome bishops, who were creatures of the pope, on pretence of their being concerned in practices against the state.

The pope at first threatened the emperor with the thunder of the church, for prefuming to lift up his hand against the fanctuary; but finding Frederic not to be intimidated, he became fentible of his own imprudence in wantonly incurring the refentment of fo powerful a prince, and thought proper to foothe him by submissive apologies and gentle exhortations. They were accordingly reconciled, and conferred together at Veroli in 1226; where the emperor, as a proof of his fincere attachment to the church, published fome very fevere edicts against herefy, which feem to have authofinated by the count Palatine of Bavaria, whose daugh- rifed the tribunal of the inquisition. A folemn assembly

was afterwards held at Ferentino, where both the pope and the emperor were present, together with John de Brienne, titular king of Jerufalem, who was come to Europe to demand fuccours against the foldan of Egypt. John had an only daughter named Yolanda, whom he proposed as a wife to the emperor, with the kingdom of Jerusalem as her dower, on condition that Frederic should within two years perform the vow he had made to lead an army into the Holy Land. Frederic married her on-these terms, because he chose to pleafe the pope; and fince that time the kings of Sicily have taken the title of king of Jeru/alem. But the emperor was in no hurry to go and conquer his wife's portion, having business of more importance on his hands at home. The chief cities of Lombardy had entered into a fecret league, with a view to renounce his authority. He convoked a diet at Cremona, where all the German and Italian noblemen were fummoned to attend. A variety of subjects were there discussed; but nothing of confequence was fettled. An accommodation, however, was foon after brought about by the mediation of the pope; who, as umpire of the dispute, decreed, that the emperor should lay aside his refentment against the confederate towns, and that the towns should furnish and maintain 400 knights for the relief of the Holy Land.

Peace being thus concluded, Honorius reminded the emperor of his vow; Frederic promifed compliance : but his holiness died before he could fee the exeeution of a project which he feemed to have fo much at heart. He was fucceeded in the papal chair by Gregory IX. brother of Innocent III.; who, purfuing the same line of policy, urged the departure of Frederic for the holy land; and finding the emperor ftill backward, declared him incapable of the imperial dignity, as having incurred the fentence of excommunication. Frederic, incenfed at fuch infolence, ravaged the patrimony of St Peter; and was actually excommunicated. The animofity between the Guelphs and Ghibellines revived; the pope was obliged to quit Rome; and Italy became a scene of war and desolation, or rather of an hundred civil wars; which, by inflaming the minds and exciting the resentment of the Italian princes, accustomed them but too much to the horrid

practices of poisoning and affaffination. During these transactions, Frederic, in order to remove the cause of all these troubles, and gratify the prejudices of a superstitious age, by the advice of his friends resolved to perform his vow: and he accordingly embarked for the Holy Land, leaving the affairs of Italy to the management of Renaldo duke of Spoleto. The pope prohibited his departure before he should be absolved from the censures of the church; but Frederic went in contempt of the church, and fucceeded better than any person who had gone before him. He did not indeed defolate Asia, and gratify the barbarous zeal of the times by spilling the blood of infidels; but he concluded a treaty with Miliden, foldan of Egypt and mafter of Syria; by which the end of his expedition feemed fully answered. The foldan ceded to him Terufalem and its territory as far as Joppa; Bethlehem, Nazareth, and all the country between Jerusalem and Ptolemais; Tyre, Sidon, and the neighbour-

prudently returned to Italy, where his presence was Italy, much wanted.

Frederic's reign, after his return from the east, was one continued quarrel with the popes. The cities of Lombardy had revolted during his absence, at the infligation of Gregory IX.; and before they could be reduced, the same pontiff excited the emperor's fon Henry, who had been elected king of the Romans, to rebel against his father. The rebellion was suppressed. the prince was confined, and the emperor obtained a complete victory over the affociated towns. But his troubles were not yet ended. The pope excommunicated him anew, and fent a bull, filled with the most abfurd and ridiculous language, into Germany, in order to fow division between Frederic and the princes of the

empire.

Frederic retorted in the fame strain, in his apology to the princes of Germany, calling Gregory the Great Dragon, the Antichrift, &cc. The emperor's apology was fullained in Germany; and finding he had nothing to fear from that quarter, he refolved to take ample vengeance on the pope and his affociates For that purpose he marched to Rome, where he thought his party was ftrong enough to procure him admission; but this favourite scheme was defeated by the activity of Gregory, who ordered a crufade to be preached against the emperor, as an enemy of the Christian faith; a ften which incenfed Frederic fo much, that he ordered all his prifoners who wore the crofs to be exposed to the most cruel tortures. The two factions of the Guelphs and Ghibellines continued to rage with greater violence than ever, involving cities, districts, and even private families, in troubles, divisions, and civil butchery; no quarter being given on either fide. Meanwhile Gregory IX. died, and was fucceeded in the fee of Rome by Celestin IV. and afterwards by Innocent IV. formerly cardinal Fiefque, who had always expressed the greatest regard for the emperor and his interest. Frederic was accordingly congratulated upon this occasion: but having more penetration than those about him, he fagely replied, " I fee little reafon to rejoice; the cardinal was my friend, but the pope will be my enemy." Innocent foon proved the justice of this conjecture. He attempted to negotiate a peace for Italy; but not being able to obtain from Is deposed Frederic his exorbitant demands, and in fear for the by the fafety of his own person, he fled into France, assem-pope. bled a general council at Lyons, and in 1245 depofed the emperor.

Conrad, the emperor's fecond fon, had already been declared king of the Romans, on the death of his brother Henry, which foon followed his confinement: but the empire being now declared vacant by the pope, the German bishops (for none of the princes were prefent), at the infligation of his holinefs, proceeded to the election of a new emperor; and they chose Henry landgrave of Thuringia, who was styled in derision, The king of priefts. Innocent now renewed the crufade against Frederic. It was proclaimed by the preaching friars, fince called Dominicans, and the minor friars, known by the name of Cordeliers or Franciscans. The pope, however, did not confine himfelf to these meafures only, but engaged in conspiracies against the life ing territories: in return for which, the emperor grant- of an emperor who had dared to refift the decree of a ed the Saracens a truce of ten years; and in 1230 coun il, and oppose the whole body of the monks and zealots_

His expe-Land.

zealots. Frederic's life was feveral times in danger from plots, poisonings, and affassinations; which induced him, it is faid, to make choice of Mahometan guards, who, he was certain, would not be under the influence of the prevailing fuperstition.

About this time the landgrave of Thuringia dying, the same prelates who had taken the liberty of creating one emperor made another; namely, William count of Holland, a young nobleman of 20 years of age, who bore the same contemptuous title with his predeceffor. Fortune, which had hitherto favoured Frederic, feemed now to defert him. He was defeated before Parma, which he had long befieged; and to complete his misfortune, he foon after learned, that his natural fon Entius, whom he had made king of Sardinia, was worsted and taken prisoner by the Bo-

In this extremity Frederic retired to his kingdom of

Naples, in order to recruit his army; and there died of a fever in the year 1250. After his death, the affairs of Germany fell into the utmost confusion, and Italy continued long in the fame diffracted flate in which he had left it. The clergy took arms againft the laity; the weak were oppressed by the strong; and all laws divine and human were difregarded. After the death of Frederic's fon Conrad who had assumed the imperial dignity as fuccessor to his father, and the death of his competitor William of Holland, a variety of candidates appeared for the empire, and feveral were elected by different factions; among whom was Richard earl of Cornwall, brother to Henry II. king of England: but no emperor was properly acknowledged till the year 1273, when Rodolph, count of Hapfburg, was unanimously raised to the vacant throne. During the interregnum which preceded the election of Rodolph, Denmark, Holland, and Hungary, entirely freed themselves from the homage they were wont to pay to the empire; and much about the same time seman emveral German cities erected a municipal form of government, which still continues. Lubec, Cologne, Brunswic, and Dantzic, united for their mutual dea famous affociation, called the Hanfeatic league; and thefe towns were afterwards joined by 80 others, belonging to different states, which formed a kind of commercial republic. Italy also, during this period, assumed a new plan of government. That freedom for which the cities of Lombardy had fo long truggled. was confirmed to them for a fum of money: they were emancipated by the fruits of their industry. Sicily likewife changed its government and its prince; of which revolution a particular account is given under the article

From the time of Frederic II. we may date the ruin of the German power in Italy. The Florentines, the Pifans, the Genoese, the Luccans, &c. became independent, and could not again be reduced. The power of the emperor, in fhort, was in a manner annihilated, when Henry VII. undertook to restore it in the beginning of the 14th century. For this purpose a diet Expedition was held at Francfort, where proper supplies being granted for the emperor's journey, well known by the archbishop of Triers, the bishop of Liege, the counts nor; and ordered, that all the cities and states of 1-

of Savoy and Flanders, and other noblemen, together with the militia of all the imperial towns. Italy was ftill divided by the factions of the Guelphs and Ghibelines, who butchered one another without humanity or remorfe. But their contest was no longer the same: it was not now a ftruggle between the empire and the priefthood, but between faction and faction, inflamed by mutual jealoufies and animofities. Pope Clement V. had been obliged to leave Rome, which was in the anarchy of popular government. The Colonnas, the Urfini, and the Roman barons, divided the city: and this division was the cause of a long abode of the pones in France, fo that Rome feemed equally loft to the popes and the emperors. Sicily was in the poffession of the house of Arragon, in consequence of the famous maffacre called the Sicilian velbers, which delivered that island from the tyranny of the French *. Carobert, . See Skills. king of Hungary, disputed the kingdom of Naples with his uncle Robert, fon of Charles II. of the house of Anjou. The house of Ette had established itself at Ferrara; and the Venetians wanted to make themfelves mafters of that country. The old league of the Italian cities no longer fubfitted. It had been formed with no other view than to oppose the emperors; and fince they had neglected Italy, the cities were wholly employed in aggrandizing themselves, at the expence of each other. The Florentines and the Genoese made war upon the republic of Pifa. Every city was also divided into factions within itself. In the midst of these troubles Henry VII. appeared in Italy in the year 1311, and caufed himfelf to be crowned king of Lombardy at Milan. But the Guelphs had concealed the old iron crown of the Lombard kings, as if the right of reigning were attached to a small circlet of metal. Henry ordered a new crown to be made, with which the ceremony of inauguration was performed.

Cremona was the first place that ventured to oppose the emperor. He reduced it by force, and laid it under heavy contributions. Parma, Vicenza, and Placentia, made peace with him on reafonable conditions. Padua paid 100,000 crowns, and received an imperial officer as governor. The Venetians presented Henry with a large sum of money, an imperial crown of gold enriched with diamonds, and a chain of very curious workmanship. Brescia made a desperate resistance, and fultained a very fevere fiege; in the course of which the emperor's brother was flain, and his army diminished to such a degree, that the inhabitants marched out under the command of their prefect Thibault de Druffati, and gave him battle : but they were repulfed with great lofs, after an obstinate engagement; and at last obliged to submit, and their city was difmantled. From Brefcia Henry marched to Genoa, where he was received with expressions of joy, and splendidly entertained. He next proceeded to Rome; where, after much bloodshed, he received the imperial crown from the hands of the cardinals. Clement V. who had originally invited Henry into Italy, growing jealous of his fuccess, had leagued with Robert king of Naples and the Urfini faction, to onpose his entrance into Rome. He entered it in spite name of the Roman expedition, he fet out for Italy, ac- of them by the affidance of the Colonnas. Now macompanied by the dukes of Austria and Bavaria, the ster of that ancient city, Henry appointed it a gover-

of Henry Vil. into ltaly.

67

3 C 2

taly (hould pay him an annual tribute. In this order he comprehended the kingdom of Naples, to which he was going to make good his claim of superiority by arms, when he died at Benevento in 1313, as is commonly fupposed, of poison given him by a Dominican friar,

in the confecrated wine of the facrament.

State of that time.

Italy.

The efforts of Henry VII. were unable to restore the Italy fince imperial power in Italy. From this time the authority of the emperor in that country confilted in a great meafure in the conveniency which the Ghibelines found in opposing their enemies under the fanction of his name. The power of the pope was much of the fame nature. He was less regarded in Italy than in any other country in Christendom. There was indeed a great party who called themselves Guelbhs : but they affected this diffinction only to keep themselves independent of the imperialifts; and the states and princes who called themselves Guelphs paid little more acknowledgment to his holiness than sheltering themselves under his name and authority. The most desperate wars were carried on by the different cities against each other; and in these wars Castruccio Castraccani, and Sir John Hawkwood an Englishman, are celebrated as heroes. A detail of these transactions would furnish materials for many volumes; and after all feems to be but of little importance, fince nothing material was effected by the utmost efforts of valour, and the belligerent states were commonly obliged to make peace without any advantage on either fide. By degrees, however, this martial fpirit fubfided; and in the year 1492, the Italians were fo little capable of refilling an enemy, that Charles VIII. of France conquered the whole kingdom of Naples in fix weeks, and might eafily have fubdued the whole country had it not been for his own imprudence. Another attempt on Italy was made by Louis XII. and a third by Francis I. as related under the article FRANCE. In the reigns of Louis XIII. and XIV, an obstinate war was carried on between the French and Spaniards, in which the Italian states bore a very confiderable share. The war concluded in 1660, with very little advantage to the French, who have been always unfuccessful in their Italian wars. The like bad fuccess attended them in that part of the world, in the war which commenced between Britain and Spain in the year 1740. But the particulars of these wars, with regard to the different states of Italy, naturally fall to be confidered under the history of those states into which the country is now divided; viz. Sardinia, Milan or the Milanefe, Genoa, Venice, Tufcany or Florence, Lucca, St Marino, Parma, Mantua, Modena, Rome, and Naples.

Air, &c. of different fituations of the feveral countries contained in it. In those on the north of the Apennines it is more temperate, but on the fouth it is generally very warm. The air of the Campania of Rome, and of the Ferrarefe, is faid to be unhealthful; which is owing to the lands not being duly cultivated, nor the marshes drained. That of the other parts is generally pure, dry, and healthy. In fummer, the heat is very great in the kingdom of Naples; and would be almost intolerable, if it was not fomewhat alleviated by the sea-breezes. The foil of Italy in general is very fertile, being watered by a great number of rivers. It produces a great

variety of wines, and the best oil in Europe; excellent filk in abundance; corn of all forts, but not in fuch plenty as in fome other countries; oranges, lemons, citrons, pomegranates, almonds, raifins, fugar, mulberry-trees without number, figs, peaches, ncctarines, apricots, pears, apples, filberts, chefnuts, &c. Most of these fruits were at first imported by the Romans from Asia Minor, Greece, Africa, and Syria, and were not the natural products of the soil. The tender plants are covered in winter on the north fide of the Apennines, but on the fouth fide they have no need of it. This country also yields good pasture; and abounds with cattle, sheep, goats, buffaloes, wild boars, mules, and horses. The forests are well stored with game; and the mountains yield not only mines of iron, lead, alum, fulphur, marble of all forts, alabaster, jasper, porphyry, &c. but also gold and filver; with a great variety of aromatic herbs, trees, fhrubs, and ever-greens. as thyme, lavender, laurel, and bays, wild olive trees, tamarinds, juniper, oaks, and pines.

A very extensive trade is carried on in many places in Italy, particularly at Leghorn, Genoa, Bologna, Venice, and Naples; the country having a great variety of commodities and manufactures for exportation, especially wine, oil, perfumes, fruits, and filks. Travellers also bring large sums of money into Italy, befides what they lay out in pictures, curiofities, relices,

antiquities, &c.

The Italians are generally well proportioned, though Drefs, diftheir complexions are none of the best. As to dress, position, they follow the fashions of the countries on which they &c. of the border, or to which they are subject; namely, those of inhabitants-France, Spain, and Germany. With respect to their genius and tafte in architecture, painting, carving, and mulic, they are thought to excel greatly, and to leave the other nations of Europe far behind them : but their mulic feems too foft and effeminate to deferve all the praise bestowed on it; and their houses are far inferior to those of England in respect of convenience. No country hath produced better politicians, historians, poets, painters, and fculptors; we mean fince the revival of the arts and sciences, enclusive of those of ancient times. The Italians are very affable, courteous, ingenious, fober, and ready-witted; but extremely jealous, vindictive, lascivious, ceremonious, and superstitious. In respect to jealousy, indeed, we are told, that a very extraordinary change has lately taken place; and that the Italians are now no lefs indulgent and complaifant to their wives than the most polite husbands in France itself. In their tempers, the Italians feem to be a good medium between the French and Spaniards; neither fo gay and volatile as the one, nor fo grave and folemn as the other. Boiled fnails, ferved up with oil and pepper, or fried in oil. and the hinder parts of frogs, are reckoned dainty dishes. Kites, jackdaws, hawks, and magpies, are alfo eaten not only by the common people but by the better fort. Wine is drank here both in fummer and winter cooled by ice or fnow. The women affect yellow hair, as the Roman ladies and courtezans formerly did. They also use paint and washes, both for their hands and faces. The day here is reckoned from fun-fet to fun-fet, as the Athenians did of old.

ITCH, a cutaneous difease, appearing in small

Itch,

watery puffules on the fkin; commonly of a mild nature, though fometimes attended with obstinate and dangerous fymptoms. See MEDICINE-Index.

ITCH-Infedt. See ACARUS. In speaking of the manner of finding these insects in the itch. Fabricius observes, that the failure of many who have fought for them has been owing to their having expected to meet with them in the larger veficles that contain a vellowish fluid like pus; in these, however, he tells us, he has never found them, but in those pultules only which are recent, and contain only a watery fluid. We must therefore, he observes, not expect to find them in the fame proportionate number in patients who for many months have been afflicted with the difeafe, as in those in whom its appearance is recent, and where it is confined to the fingers or wrifts. The cause of this difference with respect to the pustules, he conjectures, may be owing to the death of the in-

fect after it has deposited its eggs. A fmall transparent vehicle being found, a very minute white point, distinct from the furrounding fluid, may be difcovered, and very often even without the affiltance of a glass; this is the infect, which may be eafily taken out on the point of a needle or penknife, and when placed on a green cloth may be feen much

more diffinctly, and observed to move.

The author remarks, that even before fuch a transparent veticle is formed, we may often difcover traces of the infect on the fingers or hands, in a reddish streak or furrow, which is occasioned by the acarus; and he adds, that it is even more usual to find it in these furrows than in the puttules themselves. He tells us. that a friend of his at Hanover (who had the itch in a flight degree, and to whofe accurate inquiries with an excellent microscope he acknowledges himself much indebted) found feveral infects in fuch furrows. Two of the longest of the furrows were about an inch in extent. They feemed to be thoroughly dry, but exhibited here and there very minute shining and transparent fpots. These spots, however, were not at all elevated above the furface of the fkin; and although feveral of them were opened and examined, no infect was found in them. Their furrows he has observed only on the hands and fingers, having in vain fought for them on the legs and other parts of the body, in his children, who had the itch in a high degree.

ITEA, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking with those of which the order is doubtful. The petals are long, and inferted into the calyx; the capfule unilocular and bivalved. There is but one species, a native of North America. It grows by the fides of rivers, and in other parts where the ground is moift. It rifes to the height of eight or ten feet, fending out many branches garnished with spear-shaped leaves placed alternately, and flightly fawed on their edges, of a light green colour. At the extremity of the branches are produced fine spikes of white flowers three or four inches long, ttanding erect. When these shrubs are in vigour, they will be entirely covered with flowers, fo that they make a beautiful appearance during the flowering feafon, which is in July. They are propagated by layers, are apt to die in summer, if they are planted on a dry N. Lat 54. 8.

gravelly foil. The shoots should be laid down in autumn, and will be rooted in one year. Itzehoa.

ITHACA (anc. geog.), an island in the Ionian fea, on the coast of Epirus; the country of Ulysses, near Dulichium, with a town and port fituated at the foot of mount Neius. According to Pliny it is about 25 miles in compass; according to Artemidorus only 10; and is now found to be only eight miles round. It is now uninhabited, and called Fathaco.

ITINERARY, ITINERARIUM; a journal or an account of the distances of places. The most remarkable is that which goes under the names of Antoninus and Æthicus; or, as Barthius found in his copy, Antoninus Æthicus; a Christian writer, posterior to the times of Constantine. Another, called Hierofolymitanum, from Bourdeaux to Jerufalem, and from Heraclea through Aulona and Rome to Milan, under Constantine .-

Itinerarium denotes a day's march.

ITIUS PORTUS (anc. geog.), the crux geographorum, fuch being the difficulty of afcertaining its polition. It would be endlefs to recite the feveral opinions concerning it, with the feveral reasons advanced in support of them. Three ports are mentioned by Cæfar; two without any particular name, viz the Higher and the Lower, with respect to the Portus Itius. Calais, Boulogne, St Omer, and Whitfand. have each in their turn had their feveral advocates. Cæfar gives two diftinctive characters or marks which feem to agree equally to Boulogne, and Whitfand, namely, the shortness of the passage, and the situation between two other ports; therefore nothing can with certainty be determined about the fituation of the Portus Itius.

ITTIGIUS (Thomas), a learned professor of divinity at Leipfic, and fon of John Ittigius, profeffor of physic in the same university. He first published A Treatife upon Burning Mountains; after which he became a minister, and exercised that function in various churches there. He furnished several papers in the Leipfic acts, befides publishing some historical works

and differtations. He died in 1710.
ITYS (fab. hift.), a fon of Tereus king of Thrace, by Procne daughter of Pandion king of Athens. He was killed by his mother when he was about fix years old, and ferved up before his father. He was changed into a pheafant, his mother into a swallow, and his fa-

ther into an owl,

ITZECUINTEPOTZOTLI, or HUNCH-BACKED Plate Dog, a Mexican quadruped fimilar to a dog. It is CCXLIX; as large as a Maltelan dog, the skin of which is varied with white, tawny, and black. Its head is fmall in proportion to its body, and appears to be joined directly to it on account of the shortness and greatness of its neck; its eyes are pleafing, its ears loofe, its nofe has a confiderable prominence in the middle, and its tail fo small, that it hardly reaches half way down its leg; but the characteristic of it is a great hunch which it bears from its neck to its rump. The place where this quadruped most abounds is the kingdom of Mi-

ITZEHOA, an ancient and handsome town of. Germany, in the circle of Lower Saxony, and duchy. of Holftein. It belongs to the king of Denmark, and are not injured by the cold of this climate; but and is feated on the river Stoer, in E. Long. 9, 25.

chnacan, where it is called Ahora.

IVA, in botany: A genus of the pentandria order, don. It was formerly a place of refort for the buccathe natural method ranking under the 49th order, Composite. The male calyx is common and triphyllous; the florets of the difc monopetalous and quinquefid; the receptacle divided by small hairs. There is no female calvx nor corolla; but five florets in the radius; two long ftyles; and one naked and obtufe

IVAHAH is the name of one of the canoes or boats used by the islanders of the South sea for short excursions to sea: it is wall-sided and flat-bottomed. These boats are of different fizes, their length being from 72 feet to 10: but their breadth is by no means in proportion; for those of ten feet are about a foot wide, and those of more than 70 are fearcely two. The fighting ivalials is the longest, with its head and stern confiderably raifed above the body in a femicircular form: the stern is fometimes 17 or 18 feet high. When they go to fea, they are fastened together side by fide, at the diflance of about three feet, by ftrong poles of wood laid across and lashed to the gun-whales. On these, in the fore-part, a stage or platform is raifed, about 10 or 12 feet long, somewhat wider than the boats, and supported by pillars about fix feet high: on this stage are ranged the fighting men, whose miffile weapons are flings and spears; and below the flage the rowers fit. The fishing ivahahs are from 40 feet long to 10; those of 25 feet and upwards occafionally carry fail. The travelling ivahah is always double, and furnished with a small neat house about five or fix feet broad, and fix or feven feet long.

JUAN (St) DE LA FRONTERA, a town of South-America, in Chili, in the province of Chiquito, near the lake Guanacho. The territory of this town is inhabited by 20,000 native Americans, who are tributary to Spain. It contains mines of gold, and produces a kind of almonds that are very delicate. It is feated at the foot of the Andes, in W. Long. 66. 35.

S. Lat. 23. 25.

FUAN de Porto Ricco, an island of America, and one of the Caribbees, being 100 miles in length and 50 in breadth. It belongs to the Spaniards; and is full of very high mountains, and extremely fertile valleys, interspersed with woods, and well watered with springs and rivulets. It produces fugar, rum, ginger, corn, and fruits; partly proper to the climate, and partly introduced from Spain. Befides, there are fo many cattle, that they often kill them for the fake of the skins alone. Here are a great number of uncommon trees, and there is a little gold in the north part of the island. It is commonly said that the air is healthy; and yet the earl of Cumberland, when he had taken this island, lost most of his men by sickness; and for that reason was forced to abandon it. This happened in the reign of Queen Elizabeth. It is subject to ftorms and hurricanes, like the rest of these islands. It lies to the east of Hispaniola, at the distance of 50 miles.

JUAN de Porto Ricco, the capital town of the island of Porto Ricco, with a good harbour defended by feveral forts, and a bishop's see. It is seated on the north coast of the island, in W. Long. 65. 35. N. Lat.

JUAN Fernandez, an island in the great South Sea, in S. Lat. 33. 40. and W. Long. 78. 30. from Lon-

belonging to the monœcia class of plants; and in neers who annoved the western coast of the Spanish continent. They were led to refort hither from the multitude of goats which it nourished; to deprive their enemies of which advantage, the Spaniards transported a confiderable number of dogs, which increasing greatly, have almost extirpated the goats, who now only find fecurity among the fleep mountains in the northern parts, which are inacceffible to their purfuers. There are inflances of two men living, at different times, alone on this island for many years; the one a Musquito Indian; the other Alexander Selkirk, a Scotchman, who was, after five years, taken on board an English ship, which touched here in about 1710, and brought back to Europe. From the history of this recluse, Daniel de Foy is faid to have conceived the idea of writing the adventures of Robinson Crusoe. This island was very propitious to the remains of commodore Anfon's foundron in 1741, after having been buffeted with tempelts, and debilitated by an inveterate feurvy, during a three months paffage round Cape Horn: they continued here three months; during which time the dying crews, who on their arrival could fcarcely with one united effort heave the anchor, were restored to perfect health. Captain Carteret, in the Swallow, in 1767, having met with many difficulties and impediments in his passage into the South Sea, by the Straits of Magelhaens, attempted to make this island in order to recruit the health of his men; but he found it fortified by the Spaniards, and therefore chose rather to proceed to the island of Masafuero. But M. de Bougainville that fame year is faid to have touched here for refreshments, although in the narrative of the vovage the fact is cautiously suppressed. This island is not quite 15 miles long and about fix broad: its only fafe harbour is on the north fide. It is faid to have plenty of excellent water, and to abound with a great variety of esculent vegetables highly antiscorbutic; besides which, commodore Anson fowed a variety of garden-feeds, and planted the stones of plums, apricots, and peaches, which he was many years afterwards informed had thriven greatly; and now doubtless furnish a very valuable addition to the natural productions of this fpot. Valt shoals of fish of various kinds frequent this coast, particularly cod of a prodigious fize; and it is faid in not less abundance than on the banks of Newfoundland. There are but few birds here, and those few are of species well known and common.

TUAN Blanco. See PLATINA.

IUBA, a king of Numidia and Mauritania. He had fucceeded his father Hiempfal, and he favoured the cause of Pompey against Julius Cæsar. He defeated Curio whom Cæfar had fent to Africa, and after the battle of Pharfalia he joined his forces to those of Scipio. He was conquered in a battle at Thapfus, and totally abandoned by his subjects. He killed himself with Petreins who had shared his good fortune and his advertity, in the year of Rome 707. His kingdom became a Roman province, of which Sallust was the first governor.

JUBA II. fon of the former, was led among the captives to Rome to adorn the triumph of Cæsar. His captivity was the fource of the greatest honours, and his application to fludy procured him more glory than

dom. He gained the heart of the Romans by the courteoufness of his manners, and Augustus rewarded his fidelity by giving him in marriage Cleopatra the daughter of Antony, and conferring upon him the title of king, and making him mafter of all the territories which his father once possessed, in the year of Rome 723. His popularity was fo great, that the Mauritanians rewarded his benevolence by making him one of their gods. The Athenians raifed him a statue, and the Æthiopians worshipped him as a deity. Juba wrote an history of Rome in Greek, which is often quoted and commended by the ancients. Of it only few fragments remain. He also wrote on the history of Arabia, and the antiquities of Affyria, chiefly collected from Berofus. Befides these he composed some treatises upon the drama. Roman antiquities, the nature of animals. painting, grammar, &c. now loft.

IUBILEE, among the Jews, denotes every fiftieth year; being that following the revolution of feven weeks of years; at which time all the flaves were made free. and all lands reverted to their ancient owners. The jubilees were not regarded after the Babylonish captivity. -The word, according to some authors, comes from the Hebrew, jobel, which figuifies fifty: but this must be a miftake, for the Hebrew jobel does not fignify fifty; neither do its letters, taken as cyphers, or according to their numerical power, make that number; being 10, 6, 2, and 30, that is 48. - Others fav, that jobel fignifies a ram, and that the jubilee was thus cailed, because proclaimed with a ram's horn, in memory of the ram that appeared to Abraham in the thicket. Mafius chooses to derive the word from 7ubal, the first inventor of musical instruments, which, for that reason, were called by his name; whence the words jobel and jubilee came to fignify the year of deliverance and remission, because proclaimed with the found of one of those instruments which at first was no more than the horn of a ram. Others derive jobel from יבל, jabal, in hiphil יבל, hobil, which fignifies to recal or return : because this year restored all flaves to their liberty, &c. The inflitution of this festival is in Lev.

The learned are divided about the year of jubilee : fome maintaining that it was every forty ninth, and others that it was every fiftieth, year. The ground of the former opinion is chiefly this, that the forty-ninth year being of courfe a fabbatical year, if the jubilee had been kept on the fiftieth, the land must have had two fabbaths, or have lain fallow two years, which, without a miracle, would have produced a dearth. On the other hand, it is alleged, that the Scripture expressly declares for the fiftieth year, Lev. xxv. 10, 11. And befides, if the jubilee and fabbatical year had been the fame, there would have been no need of a prohibition to fow, reap, &c. because this kind of labour was prohibited by the law of the fabbatical year, Lev. xxv. 4. 5. The authors of the Universal History, book i. chap. 7. note R, endeavour to reconcile these opinions, by obferving, that as the jubilee began in the first month of the civil year, which was the feventh of the ecclefiaftical, it might be faid to be either the forty-ninth or fiftieth, according as one or other of these computations were followed. The political defign of the law of the jubilee was to prevent the too great oppressions of the poor,

Jubilee. he would have obtained from the inheritance of a king- as well as their being liable to perpetual flavery. By Jubilee. this means a kind of equality was preferved through Jucatan. all the families of Ifrael, and the diffinction of tribes was also preserved, that they might be able, when there was occasion, on the jubilee-year, to prove their right to the inheritance of their ancestors. It served also, like the Olympiads of the Greeks, and the Lustra of the Romans, for the readier computation of time. The jubilee has also been supposed to be typical of the gofpel state and dispensation, described by Isaiah, lxi. ver. I, 2. in reference to this period, as the "acceptable year of the Lord."

JUBILEE, in a more modern fense, denotes a grand church folemnity or ceremony, celebrated at Rome, wherein the pope grants a plenary indulgence to all finners; at least to as many as visit the churches of St

Peter and St Paul at Rome.

The jubilee was first established by Boniface VII, in 1300, in favour of those who should go ad limina apo-Rolorum; and it was only to return every hundred years. But the first celebration brought in such store of wealth to Rome, that the Germans called this the golden year; which occasioned Clement VI. in 1343, to reduce the period of the jubilee to fifty years. Urban VI. in 1389, appointed it to be held every thirtyfive years, that being the age of our Saviour; and Paul II. and Sixtus IV. in 1475, brought it down to every twenty-five, that every person might have the benefit of it once in his life. Boniface IX. granted the privilege of holding jubilees to feveral princes and monasteries : for instance, to the monks of Canterbury. who had a jubilee every fifty years; when people flocked from all parts to visit the tomb of Thomas a Becket. Jubilees are now become more frequent, and the pope grants them as often as the church or himfelf have occasion for them. There is usually one at the inauguration of a new pope. To be intitled to the privileges of the jubilee, the bull enjoins faltings, alms, and prayers. It gives the priefts a full power to abfolve in all cases even those otherwise reserved to the pope: to make commutations of vows, &c. in which it differs from a plenary indulgence. During the time of jubilee, all other indulgences are fufpended.

One of our kings, viz. Edward III. caufed his birth-day to be observed in manner of a jubilee, when he became fifty years of age, in 1362, but never before or after. This he did by releafing prisoners, pardoning all offences except treason, making good laws, and granting many privileges to the people.

There are particular jubilees in certain cities, when feveral of their feafts fall on the fame day; at Puey en Velay, for instance, when the feast of the Annunciation happens on Good-Friday; and at Lyons when the feath of St John Baptift concurs with the feast of Corpus Christi.

In 1640, the Jesuits celebrated a solemn jubilee at Rome; that being the centennary or hundredth year from their inflitution, and the fame ceremony was obferved in all their houses throughout the world.

JUCATAN, or YUCATAN, a large province of North-America in New Spain, which is a peninfula. It is over against the island of Cuba, and contains a large quantity of timber, proper for building ships; as also fugar, cassia, and Indian corn. The original inhabitants are few, they having been very ill used by

the Spaniards. Merida is the capital town. It is a the apostles. He was cruelly put to death for reproflat level country; and is very unhealthy, which may ving the superstition of the Magi. be owing to the frequent inundations.

JUDAH, the fourth fon of Jacob, and father of the chief of the tribes of the Jews, diftinguished by his name, and honoured by giving birth to the Meffiah.

died 1636 B. C.

TUDAH Hakkadosh, or the Saint, a rabbi celebrated for his learning and riches, lived in the time of the emperor Antoninus, and was the friend and preceptor of that prince. Leo of Modena, a rabbi of Venice. tells us, that rabbi Iudah, who was very rich, collected about 26 years after the destruction of the temple, in a book which he called the Mifnia, the constitutions and traditions of the Jewish magistrates who preceded him. But as this book was short and obscure, two Babylonish rabbis, Rabbina and Ase, collected all the interpretations, disputes, and additions, that had been made until their time upon the Misnia, and formed the book called the Babylonifb Talmud or Gemara; which is preferable to the Jerufalem Talmud, composed some years before by rabbi Jochanan of Jerusalem. The Misnia is the text of the Talmud; of which we have a good edition in Hebrew and Latin by Surenhufius. with notes, in 3 vols folio. It were to be wished the fame had been done to the Gemara.

The Kingdom of FUDAH was of small extent compared with that of the kingdom of Ifrael; confifting only of two tribes, Benjamin and Judah: its east boundary, the Jordan; the Mediterranean its west, in common with the Danites, if we except some places recovered by the Philistines, and others taken by the kings of Ifrael; on the fouth, its limits feem to have been contracted under Hadad of the royal progeny of Edom,

(Kings xi. 14.)

Tribe of TUDAH, one of the 12 divisions of Palestine by tribes (Josh. xv.), having Idumea on the fouth, from the extremity of the Lacus Afphaltites, also the Wilderness of Zin, Cadesbarnea, and the brook or river of Egypt; on the east, the faid lake; on the west, the Mediterranean; and on the north, the mouth of the faid lake; where it receives the Jordan, Bethsemes,

Thimna, quite to Ekron on the fea.

JUD AISM, the religious doctrines and rites of the Jews. Judaism was but a temporary dispensation, and was to give way, at least the ceremonial part of it, at the coming of the Messias. For a complete system of Judaifm, fee the books of Mofes. Judaifm was anciently divided into feveral fects; the principal whereof were the Pharisees, Sadducees, and Essenians.

At present there are two sects among the Jews, viz. the Caraites, who admit of no rule of religion but the law written by Moses; and the Rabbinitts, who add

to the law the traditions of the Talmud.

JUDAS MACCABEUS, a celebrated general of the Jews, renowned for his many victories over his enemies, at last flain in battle, 261 B. C. See (History of the) JEWS, no 13.

JUDAS-Tree. See CERCIS.

JUDE (St), brother of St James the younger, and

fon of Joseph (Mat. xiii. 55.). He preached in Mesopotamia, Arabia, Syria, Idumea; and died in Berytus for the confession of Christ. He wrote that epistle which goes under his name, and after the death of most of Nº 170.

JUDE, or the General Epifle of Jude, a canonical book of the New Testament, written against the heretics, who, by their diforderly lives and impious doctrines, corrupted the faith and good morals of the Christians. St Jude draws them in lively colours, as men given up to their passions, full of vanity, conducting themselves by worldly wisdom, and not by the spirit of

JUDEA (anc. geog.), taken largely, either denotes all Palestine, or the greater part of it; and thus it is generally, taken in the Roman history: Ptolemy, Rutilinus, Jerome, Origen, and Eusebius, take it for the whole of Palestine. Here we consider it as the third part of it on this fide the Jordan, and that the fouthern part is diftinct from Samaria and Galilee; under which notion it is often taken, not only in Josephus, but also in the New Testament. It contained four tribes; Judah, Benjamin, Dan, and Simeon, together with Philiftia and Idumea; fo as to be comprifed between Samaria on the north, Arabia Petræa on the fouth, and to be bounded by the Mediterranean on the west, and by the Lacus Asphaltites, with part of Jordan, on the east. Josephus divides it into 11 toparchies; Pliny into 10; by which it has a greater extent than that just mentioned. See PALESTINE.

JUDENBURG, a handsome and confiderable town of Germany, in the circle of Austria, and capital of Upper Styria, with a handsome castle; the public buildings with the fquare are very magnificent. It is feated on the river Meur. E. Long. 15. 20. N. Lat.

JUDEX (Matthew), one of the principal writers of the Centuries of Magdeburg, was born at Tipplefwolde in Mifnia, in 1528. He taught theology with great reputation; but met with many disquiets in the exercise of his ministry from party feuds. He wrote feveral works, and died in 1564.

JUDGE, a chief magistrate of the law, appointed to hear causes, to explain the laws, and to pass sen-

JUDGES, in Jewish antiquity, certain supreme magiltrates who governed the Ifraelites from the time of Joshua till the reign of Saul. These judges resembled the Athenian archons or Roman dictators. The dignity of judge was for life, but not always in uninterrupted succession. God himself, by some express declaration of his will, regularly appointed the judges: But the Ifraelites did not always wait for his appointment, but fometimes chofe themselves a judge in times of danger. The power of the judges extended to affairs of peace and war. They were protectors of the laws, defenders of religion, avengers of all crimes; but they could make no laws, nor impose any new burdens upon the people. They lived without pomp or retinue, unless their own fortunes enabled them to do it; for the revenues of their office confifted in voluntary presents from the people. They continued from the death of Joshua till the beginning of the reign of Saul, being a space of about 339 years.

JUDGES, for ordinary affairs, civil and religious, were appointed by Mofes in every city to terminate differences; in affairs of greater confequence, the dif-

Judges, ferences were referred to the priefts of Aaron's family. Judgment, and the judge of the people or prince at that time established. Moses likewise set up two courts in all the cities, one confifting of priefts and Levites, to determine points concerning the law and religion; the other confifting of heads of families, to decide in civil matters.

Book of Judges, a canonical book of the Old Teftament, fo called from its relating the flate of the Ifraelites under the administration of many illustrious persons who were called judges, from being both the civil and military governors of the people, and who were raifed up by God upon special occasions, after the death of loshua, till the time of their making a king. In the time of this peculiar polity, there were feveral remarkable occurrences, which are recorded in this book. It acquaints us with the grofs impiety of a new generation which forung up after the death of Johna; and gives us a fhort view of the dispensations of heaven towards this people, fometimes relieving and delivering them, and at others feverely chaftifing them by the hands of their enemies.

Select Funges, (Judices selecti), in antiquity, were persons summoned by the prætor to give their verdict in ariminal matters in the Roman courts, as juries do in ours. No person could be regularly admitted into this number till he was 25 years of age. The Sortitio Judician, or impannelling the jury, was the office of the Julex Questionis, and was performed after both parties were come into court, for each had a right to reject of challenge whom they pleafed, others being fublitived in their room. The number of the Judices feledi varied, according to the nature of the charge. When the proper number appeared, they were fworn, took their places in the fubfellia, and heard the trial.

JUDGMENT, among logicians, a faculty or rather act of the human foul, whereby it compares its ideas. and perceives their agreement or disagreement. See

METAPHYSICS; and LOGIC, Part II.

JUDGMENT, in law, is the fentence pronounced by the court upon the matter contained in the record. Judgments are of four forts. First, where the facts are confessed by the parties, and the law determined by the court; as in case of judgment upon demurrer : secondly, where the law is admitted by the parties, and the facts disputed; as in the case of judgment on verdid: thirdly, where both the fact and the law arifing thereon are admitted by the defendant; which is the case of judgments by confession or default: or, lastly, where the plaintiff is convinced that either fact, or law, or both, are infufficient to support his action, and therefore abandons or withdraws his profecution; which is the case in judgments upon a nonsuit or re-

The judgment, though pronounced or awarded by the judges, is not their determination or fentence, but the determination and fentence of the law. It is the conclusion that naturally and regularly follows from the premiffes of law and fact, which flands thus: Against him who hath rode over my corn, I may recover damages by law; but A hath rode over my corn; therefore I shall recover damages against A. If the here as when pleaded upon ARRAIGNMENT; viz. the major proposition be denied, this is a demurrer in law: if the minor, it is then an iffue of fact : but if both be TION of blood : which nothing can restore but parliaconfessed or determined to be right, the conclusion ment, when a pardon is not pleaded till after sentence.

VOL. IX. Part I.

judgment or conclusion depends not therefore on the Judgmentarbitrary caprice of the judge, but on the fettled and invariable principles of justice. The judgment, in short, is the remedy prescribed by law for the redress of injuries; and the fuit or action is the vehicle or means of administering it. What that remedy may beis indeed the refult of deliberation and fludy to point out; and therefore the flyle of the judgment is, not that it is decreed or resolved by the court, for then the judgment might appear to be their own; but, " it is confidered," consideratum est per curiam, that the plaintiff do recover his damages, his debt, his poffession, and the like : which implies that the judgment is none. of their own; but the act of law, pronounced and declared by the court, after due deliberation and inquiry.

See Blackst. Comment. iii. 396.

JUDGMENT, in criminal cases, is the next stage of profecution, after TRIAL and CONVICTION are palt, in fuch crimes and misdemeanors as are either too high or too low to be included within the benefit of clergy. For when, upon a capital charge, the JURY have brought in their VERDICT guilty in the presence of the prisoner; he is either immediately, or at a convenient time foon after, asked by the court, if he has any thing to offer why judgment should not be awarded against him. And in case the defendant be found guilty of a mifdemeanor (the trial of which may, and does usually, happen in his absence, after he has once appeared), a capias is awarded and iffned, to bring him in to receive his judgment; and if he absconds, he may be profecuted even to outlawry. But whenever he appears in perion, upon either a capital or inferior conviction, he may at this period, as well as at his arraignment, offer any exceptions to the indictment, in arrest or ftay of judgment; as for want of fufficient certainty in fetting forth either the person, the time, the place, or the offence. And if the objections be valid, the whole proceedings shall be fet aside; but the party may be indicted again. And we may take notice, I. That none of the statutes of jeofails, for amendment of errors, extend to indictments or proceedings in criminal cases; and therefore a defective indictment is not aided by a verdict, as defective pleadings in civil cases are. 2. That, in favour of life, great strictness has at all Blacks.

times been observed, in every point of an indictment. Comments Sir Matthew Hale indeed complains, " that this ftrictness is grown to be a blemish and inconvenience in the law, and the administration thereof: for that more offenders escape by the over easy ear given to exceptions in indictments, than by their own innocence; and many times groß murders, burglaries, robberies, and other heinous and crying offences, remain unpunished by these unseemly niceties: to the reproach of the law, to the shame of the government, to the encouragement of villainy, and to the dishonour of God." And yet, notwithstanding this laudable zeal, no man was more tender of life than this truly excel-

lent judge.

A pardon also may be pleaded in arrest of judgment: and it has the fame advantage when pleaded faving the ATTAINDER, and, of course, the CORRUPor judgment of the court cannot but follow. Which And certainly, upon all accounts, when a man hath

Judgment. obtained a pardon, he is in the right to plead it as foon of the court. Whereas, where an established penalty Judgment is annexed to crimes, the criminal may read their

Praying the benefit of clergy may also be ranked among the motions in arrest of judgment. See Benefit of CLERGY.

If all these resources fail, the court must pronounce that judgment which the law hath annexed to the crime. Of these some are capital, which extend to the life of the offender, and confift generally in being hanged by the neck till dead; though in very atrocious crimes other circumstances of terror, pain, or difgrace, are superadded: as, in treasons of all kinds, being drawn or dragged to the place of execution; in high treafon affecting the king's person or government, embowelling alive, beheading, and quartering; and in murder, a public diffection. And in case of any treafon committed by a female, the judgment is to be burned alive: But the humanity of the English nation has authorifed, by a tacit confent, an almost general mitigation of fuch parts of these judgments as savour of torture or cruelty : a fledge or hurdle being ufually allowed to fuch traitors as are condemned to be drawn; and there being very few inftances (and those accidental or by negligence) of any persons being embowelled or burned, till previously deprived of fensation by strangling. Some punishments confist in exile or banishment, by abjuration of the realm, or transportation to the American colonies: others, in lofs of liberty, by perpetual or temporary imprisonment. Some extend to confifcation, by forfeiture of lands, or moveables, or both, or of the profits of lands for life: others induce a difability of holding offices or employments, being heirs, executors, and the like. Some, though rarely, occasion a mutilation or difmembering, by cutting off the hand or ears: others fix a lafting ftigma on the offender, by flitting the nostrils or branding in the hand or face. Some are merely pecuniary, by ftated or diferetionary fines: and, laftly, there are others that confift principally in their ignominy, though most of them are mixed with some degree of corporeal nain: and these are inflicted chiefly for such crimes as either arise from indigence, or render even opulence difgraceful. Such as whipping, hard labour in the house of correction, the pillory, the stocks, and the

ducking-stool. Difgusting as this catalogue may seem, it will afford pleasure to a British reader, and do honour to the British laws, to compare it with that shocking apparatus of death and torment to be met with in the criminal codes of almost every other nation in Europe. And it is moreover one of the glories of our law, that the nature, though not always the quantity or degree, of punishment is afcertained for every offence; and that it is not left in the breast of any judge, nor even of a jury, to alter that judgment which the law has beforehand ordained for every subject alike, without refpect of persons. For, if judgments were to be the private opinions of the judge, men would then be flaves to their magistrates; and would live in society, without knowing exactly the conditions and obligations which it lays them under. And, besides, as this prevents oppression on the one hand; fo, on the other, it stiffes all hopes of impunity or mitiga-

of the court. Whereas, where an ethablified penalty is annexed to crimes, the criminal may read their certain confequence in that law, which ought to be the unvaried rule, as it is the inflexible judge, of his actions.

Iveach,

JUDICATURE, the quality or profession of those

who administer justice.

JUDICATURE is also used to signify the extent of the jurisdiction of the judge, and the court wherein he sits to render justice.

JUDICIA CENTUMVIRALIA, in Roman antiquity, were trials before the Gatumoiri, to whom the prator committed the decision of certain matters of inferior nature, like our julitices of peace at the quarter feffons. During the judicia contumirically, a spear was fluck up in the forum to fignify that the court was fitting.

JUDICIUM CALUMNIÆ, was an action brought against the plaintiff for false accusation. The punishment, upon conviction, was inustion frontis, or branding in the feedback.

in the forehead. Sec Invision.

Yourcus Di, Yeulgment of God, was a term anciently applied to all extraordinary trials of feeret crimes; as those by arms, and fingle combat, and the ordeals; or those by fire, or red-hot plough-finares; by plunging the arm in boiling water, or the whole body in cold water; in hopes God would work a miracle, rather than fuffer truth and innocence to perifh. Si fuper definder one politi, judico Doi, foil, aqua wal ferro, firet de ev jufitio.—These customs were a long time kept up even among Christians; and they are fillin in the in fome nations. See Batter, Ordeat, See.—Trisls of this fort were usually held in churches in presence of the bishops, priestls, and secoular judges; after three days fastling, confession, communion, and many adjurations and ceremonics described at large by Du Cange.

JUDICION Parium denotes a trial by a man's equals, i.e. of peers by peers, and of commoners by commoners. In magna charta it is more than once infitted on as the principal bulwark of our liberties, but effecially by chap. 29. that no freeman fhall be hurt in either his person or property, nift per legale judicium partum fuorum vel per legam terras. And this was ever esteemed in all countries a privilege of the highest and most beneficial nature.

JUDICIUM Falfi, was an action which lay against the judges for corruption or unjust proceedings.

Judician Pravaricationis, was an action brought against the profession, after the criminal was acquitted for suppressing the evidence of, or extensating his guilt, rather than urging it home, and bringing it to light.

JUDOIGNE, a town of the Austrian Netherlands, in Brabant. Near this town the duke of Marlborough gained that fignal victory over the French in 1706, called the battle of Ramillies. It is feated on the river Gete, 13 miles fouth-east of Louvain, and 16 north of Namur.

flaves to their magilitrates; and would live in fociety, without knowing exactly the conditions and obligations which it lays them under. And, befides, the country of Down, and province of Uffer. They are diffinguished into Upper and Lower I weach, and the other; it filles all hopes of impunity or mitigation, with which an offender might flatter himself if taken from Abbins, in Irith called Earback, grantly his punishment depended on the humour or difference after to king Coalboigs, as much as to lay "the

erritory

Tuernus territory of Eachach :" for hy, in the Irish language, in the natural method ranking under the goth order. Juglans. is a common adjective, tlenoting not only the heads Tuglans. and founders of families, but also the territories poi-

feffed by them. Iveach (including both baronies) was otherwise called the Magennises country, and in queen Elizabeth's rime was governed by Sir Hugh Magennis. efteemed to have been one of the most polite of all the natives in those parts. Through part of this barony runs a chain of mountains confiderably high, known by the name of Iveach mountains.

IUERNUS (anc. geog.), a town in the fouth-weit of Ireland. Now Dunkeram, (Camden); called Donekyne by the natives, fituated on the river Maire, in the

province of Muniter.

IUERNUS, or Iernus; Ptolemy; a river in the fouthwest of Ireland. Now called the Maire, or Kenmare, running from east to west, in the province of Munster,

IVES, or Yves (St), a celebrated bishop of Chartres, born in the territory of Beauvais in the 11th century. His merit procured his election to the fee of Chartres in 1002, or 1003, under the pontificate of Urban II. who had deposed Geoffroy his predeceffor for fundry acculations against him. Ives particularly fignalized himfelf by his zeal against Philip I. who had put away his wife Bertha of Holland, and had taken Bertrade of Montford, wife of Fouques count of Anjou. Afterward he devoted himself wholly to the functions of his ministry; made feveral religious foundations; and died in 1115. Pope Pius V. permitted the monks of the congregation of Lateran to celebrate the festival of St Ives on the 20th of May. We have a collection of decrees of his compiling, Exceptiones ecclesiasticarum regularum, a Chronicon, and 22 fermons; all very valuable pieces, which were collected and published in one volume folio in 1647, by John Baptist Souciet, canon of Chartres.

Ives (St), a fea port town of Cornwall, in England, feated on a bay of the fame name; which being unfafe, it is chiefly frequented by fishermen, for the taking of pilchards. By this trade, however, and that of Cornifa flates, it has thriven greatly, and 20 or 30 fail of fhips belongs to its harbour. It is a corporation, governed by a mayor, 12 capital and 24 inferior burgeffes, with a recorder, town clerk, &c. and it fends two members to parliament. Here is a handsome spacious church, which is often buffeted by the waves of the fea; but the mother church is at Unilalant. There is a grammar-school here, which was founded by Charles I. It has two markets in the week, and an

annual fair.

IVES (St), is also the name of a town in Huntingdonshire, 64 miles from London. It has a fine stone bridge over the Oufe, had in the ninth century a mint, and was noted for its medicinal waters. Great part of it was burnt down fome years ago, but it was rebuilt. Here is a very good market on Monday for fatted cattle brought from the north; and there are two fairs in the year. Here Oliver Cromwell rented a farm before he was chosen a burgess for Cambridge.

JUGERUM, in Roman antiquity, a square of 120 Roman feet; its proportion to the English acre being

as 10.000 to 16.097.

JUGLANS, in botany: A genus of the monœcia order, belonging to the polyandria class of plants; and

Amentacea. The male calyx is monophyllous, and fquamiform; the corolla divided into fix parts; there are 18 filaments: the female calyx is quadrifid, fuperior; the corolla quadripartite; there are two flyles, and the fruit a plumb with a furrowed kernel. There are five species, the most remarkable of which is the regia or common walnut. This rifes 50 feet high or more, with a large upright trunk, branching into a very large fpreading head, with large pinnated leaves, of two or three pair of oval, fmooth, fomewhat ferrated lobes, terminated by an odd one; and moncecious flowers, facceeded by clufters of large green fruit, inclosing furrowed nuts of different shapes and fizes in the varieties, ripening in September and October. Other two species, called the nigra and alba, or black and white Virginian walnut, are also cultivated in this country, though they are less proper for fruithaving very fmall kernels.

Culture. All the forts are propagated by planting their nuts, which will grow in any common foil. The nuts being procured in the proper feafon, in their outer covers or hulks if poslible, they should be preferved in dry fand until February, and then planted. After two years growth in the feed bed, they are to be taken out, and planted in the nursery, where they must remain till grown five or fix feet high, when they muit be transplanted where they are finally to remain; but if intended for timber as well as fruit trees, they ought to be finally transplanted when they have attain-

ed the height of three or four feet.

Ules. The fruit is used at two different stages of growth; when green to pickle, and when ripe to eat raw. As a pickle, the nuts may be used when about half or three-fourths grown, before the outer coat or shell becomes hard; fuch nuts should be chosen as are most free from specks, and for this purpose they must be gathered by hand. Walnuts are ready for pickling in July and August. They are fully ripe in September and October; and are then commonly beat down with long poles, especially on large trees; for as the walnuts grow mostly at the extremities of the branches, it would be troublesome and tedious to gather them by hand. As foon as gathered, lay them in heaps a few days to heat and lweat, to cause their outer husks, which adhere closely, to separate from the shell of the nuts; then clean them from the rubbish, and deposit them in some dry room for use, covering them over close with dry straw half a foot thick, and they will keep three or four months. They are always readily fold at market, especially in London; where, at their first coming in, they are fold with the husks on, by the fack or bushel; but afterwards are bought clean, and fold both by measure and by the thousand. The wood of the walnut-tree is also very valuable; not indeed where strength is necessary, it being of a very brittle nature; but the cabinet-makers and joiners efteem it highly for feveral forts of household furniture and other light works; for being beautifully veined, it takes a fine polish, and the more knotty it is, the more it is valued for particular purposes. Walnuttrees are also well adapted for planting round the borders of orchards, where, by their large spreading heads, they will also guard the leffer fruit-trees from

Jugora boisterous winds. in quality to almonds; but are not like them used in Tuice. medicine.

JUGORA, a confiderable province of Muscovy, depending on the government of Archangel. It has the title of a duchy; and is inhabited by a kind of Tartars, who are very favage, and much of the fame disposition with the Samoiedes.

JUGULAR, among anatomists, is applied to certain veins and glands of the neck. See ANATOMY.

JUGULARES, in the Linnæan fystem, is the name of an order or division of fish, the general character of which is, that they have ventral fins before the pectoral fins. See Zoology.

JUGUM, an humiliating mode of punishment inflicted by the victorious Romans upon their vanquished enemies. It was thus: They fet up two spears, and laving a third across, in the form of a gallows, they ordered those who had furrendered themselves to pass under this ignominious erection, without arms or belts. None fuffered the difgrace of paffing fub jugo but fuch

as had been obliged to furrender.

JUGURTHA, the illegitimate fon of Manastabal the brother of Micipfa. Micipfa and Manastabal were the fons of Mafinissa, king of Numidia. Micipfa, who had inherited his father's kingdom, educated his nephew with his two fons Adherbal and Hiempfal; but as he faw that the former was of an afpiring disposition, he fent him with a body of troops to the affiftance of Scipio, who was belieging Numantia, hoping to lose a youth whose ambition seemed to threaten the tranquillity of his children. His hopes were fruftrated: Juguitha flowed himself brave and active, and he en-deared himself to the Roman general. Micipsa ap-pointed him successor to his kingdom with his two fons, but the kindness of the father proved fatal to the children. Jugartha destroyed Hiempfal, and stripped Adherbal of his possessions, and obliged him to fly to Rome for fasety. The Romans listened to the wellgrounded complaints of Adherbal; but Jugurtha's gold prevailed among the fenators, and the fuppliant monarch, forfaken in his diftress, perished by the snares of his enemy. Cæcilius Metellus was at last fent against Jugurtha; and his firmness and success soon reduced the crafty Numidian, obliging him to fly among his favage neighbours for fupport. Marius and Sylla fucceeded Metellus, and fought with equal fuccefs. Jugurtha was at last betrayed by his father-in-law Bocchus, from whom he claimed affiftance; and he was delivered into the hands of Sylla 106 years before the Christian era. He was exposed to the view of the Roman people, and dragged in chains to adorn the triumph of Marius. He was afterwards put in a prifon, where he died fix days after of hunger.

IVICA, or Yvica, the name of an island in the

Mediterranean. See Yvica.

JUICE, denotes the sap of vegetables, or the liquots of animals. See ANATOMY, BLOOD, PLANTS,

The juices of feveral plants are expressed to obtain their effential falts, and for feveral medicinal purpofes, with intention either to be used without further preparation, or to be made into fyrups and extracts. The general method of extracting these juices is, by pound-

The kernels of the nuts are fimilar ing the plant in a marble mortar, and then by putting Juice. onds; but are not like them used in it into a press. Thus is obtained a muddy and green liquor, which generally requires to be clarified, as we shall foon observe. The juices of all plants are not extracted with equal eafe. Some plants, even when fresh, contain so little juice, that water must be added while they are pounded, otherwise scarcely any juice would be obtained by expression. Other plants which contain a confiderable quantity of juice, furnish by expression but a small quantity of it, because they contain also much mucilage, which renders the juice so viscid that it cannot flow. Water must also be added to these plants to obtain their juice. The juices thus obtained from vegetables by a mechanical method, are not, properly fpeaking, one of their principles, but rather a collection of all the proximate principles of plants which are foluble in water: fuch as the fanonaceous extractive matter, the mucilage, the odoriferous principle, all the faline and faccharine fubitances; all which are diffolved in the water of the vegetation of the plants. Besides all these matters, the juice contains fome part of the refinous fubftance, and the green colouring matter, which in almost all vegetables is of a refinous nature. These two latter substances, not being foluble in water, are only interpofed between the parts of the other principles which are diffolved in the juice, and confequently difturbs its transparency. They nevertheless adhere together in a certain degree. and fo strongly in most juices, that they cannot be feparated by filtration alone. When therefore these juices are to be clarified, fome previous preparations must be used by which the filtration may be facilitated. Juices which are acid, and not very mucilaginous, are spontaneously clarified by rest and gentle heat. The juices of most antiscorbutic plants abounding in saline volatile principles, may be disposed to filtration merely by immersion in boiling water; and as they may be contained in closed bottles, while they are thus heated in a water bath, their faline volatile part, in which their medicinal qualities chiefly confift, may thus be preserved. Fermentation is also an effectual method of clarifying juices which are fufceptible of it; for all liquors which have fermented, clarify spontaneously after fermentation. But this method is not used to clarify juices, because many of them are susceptible of only an imperfect fermentation, and because the qualities of most of them are injured by that process. The method of clarification most generally used, and indispenfably necessary for those juices which contain much mucilage, is boiling with the white of an egg. This matter, which has the property of coagulating in boiling water, and of uniting with mucilage, does accordingly, when added to the juice of plants, unite with, and coagulate their mucilage, and feparates it from the juice in form of fcum, together with the greatest part of the refinous and earthy matters which difturb its transparency. And as any of these refinous matters which may remain in the liquor, after this boiling with the whites of eggs, are no longer retained by the mucilage, they may eafily be feparated by filtration. See FILTRATION.

The juices, especially before they are clarified, contain almost all the same principles as the plant itself; because in the operation by which they are extracted, no decomposition happens, but every thing remains, as parates, but dries into an uniform cake: the common Juice. to its nature, in the same state as in the plant. The red wild poppy bleeds freely with a milky juice; and principles contained in the juice are only separated from the heads or capfules of feed bleed not less freely than the groffer oily, earthy, and refinous parts, which compose the folid matter that remains under the press. These juices, when well prepared, have therefore the fame medicinal qualities as the plants from which they are obtained. They must evidently differ from each other as to the nature and proportions of the principles with which they are impregnated, as much as the plants from which they are extracted differ from each other in those respects.

Most vegetable juices coagulate when they are exposed to the air, whether they are drawn out of the plant by wounds, or naturally run out; though what is called naturally running out, is generally the effect of a wound in the plant, from a fort of canker, or fome other internal cause. Different parts of the same plant yield different juices. The fame veins in their course through the different parts of the plant yield juices of a different appearance. Thus the juice in the root of the cow parinep is of a brimftone colour; but in the

stalk it is white.

Among those juices of vegetables which are clammy and readily coagulate, there are fome which readily break with a whey. The great wild lettuce, with the fmell of opium, yields the greatest plenty of milky juice of any known British plant. When the stalk is wounded with a knife, the juice flows readily out like a thick cream, and is white and ropy; but if these wounds are made at the top of the stalks, the juice that flows out of them is dashed with a purple tinge, as if cream had been sprinkled over it with a few drops of red wine. Some little time after letting this out, it becomes much more purple, and thickens; and finally, the thicker part of it separates, and the thin whey swims at top. The whey or thin part of this separated matter is eafily pressed out from the curd by squeezing between the fingers, and the curd will then remain white; and on washing with water, it becomes like rags. purple whey (for in this is contained all the colour foon dries into a purple cake, and may be crumbled between the fingers into a powder of the same colour. The white curd being dried and kept for fome time, becomes hard and brittle. It breaks with a shining furface like refin, and is inflammable; taking fire at a candle, and burning all away with a ftrong flame. The fame thick part being held over a gentle heat, will draw out into tough long threads, melting like wax. The purple cake made from the whey is quite different from this; and when held to a candle scarce flames at all, but burns to a black coal. The whole virtue of the plant feems also to consist in this thin part of its juice: for the coagulum or curd, though looking like wax or refin, has no tafte at all; whereas the purple cake made from the ferum is extremely bitter, and of a talte fomewhat refembling that of opium.

Of the fame kind with the wild lettuce are the are all replete with a milky juice which separates into curds and whey like that already described. But this, though a common law of nature, is not universal; for oily nature. These, when rubbed, are not at all of a there are many plants which yield the like milky clammy nature, but make the fingers glib and slippery, juices without any separation ensuing upon their ex- and do not all harden on being exposed to the air.

the rest of the plant, even after the flower is fallen. This juice, on being received into a shell or other small veffel, foon changes its white to a deep yellow colour, and dries it into a cake which feems refinous and oily, but no whey feparates from it. The tragopogon, or goat's beard, when wounded, bleeds freely a milky juice; it is at first white, but becomes immediately yellow, and then more and more red, till at length it is wholly of a dufky red. It never feparates, but dries together into one cake; and is oily and refinous, but of an infipid tafte. The great bindweed also bleeds freely a white juice; the flowers, as well as the stalks and leaves, affording this liquor. It is of a fharp tafte; and as many of the purging plants are of this class, it would be worth trying whether this milk is not purgative.

These juices, as well as the generality of others which bleed from plants, are white like milk; but there are some of other colours. The juice of the great celandine is of a fine yellow colour; it flows from the plant of the thickness of cream, and soon dries into a hard cake, without any whey feparating from it. Another yellow juice is yielded by the feedveffels of the yellow centaury in the month of July, when the feeds are full grown. This is very clammy; it foon hardens altogether into a cake without any whey feparating from it. It flicks to the fingers like birdlime, is of the colour of pale amber, and will never become harder than foft wax if dried in the shade; but if laid in the fun, it immediately becomes hard like resin. These cakes burn like wax, and emit a very pleafant fmell. The great angelica also yields a yellowish juice on being wounded; and this will not harden at all, but if kept feveral years will fill be foft and clammy, drawing out into threads or half melted refin.

Another kind of juices very different from all thefe, are those of a gummy nature. Some of these remain liquid a long time, and are not to be dried without the affistance of heat; the others very quickly harden of themselves, and are not inflammable. The gum of the juice of rhubard-leaves foon hardens; and is afterwards foluble in common water, and fparkles when put into the flame of a candle. The clusters of the com-mon honeysuckle are full of a liquid gum. This they frequently throw out, and it falls upon the leaves, where it retains its own form. The red hairs of the ros folis are all terminated by large bladders of a thin watery fluid. This is also a liquid gum; it sticks to the fingers, draws out into long threads, and stands the force of the fun all day. In the centre of each of these dew-drops there is a fmall red bladder, which stands immediately on the fummit of the red hair, and contains a purple juice which may be fqueezed out of it. The pinguicula, or butter-wort, has also a gummy throatwort, spurge, and many other plants. These matter on its leaves in much greater quantity than the ros folis.

Some plants yield juices which are manifestly of an travafation. The white juice of the fonchus never fe- If the stalk of elecampane be wounded, there slows.

out an oily juice fwimming upon a watery one. The vert them by his careffes, and by temporal advantages Tulian. fwimming upon the other; and in like manner the white mullein, the berries of ivy, the bay, juniper, dog-berry tree, and the fruit of the olive, when wounded, show their oil floating on the watery juice. Some of thefe oily juices, however, harden into a kind of refin. Our ivy yields fuch a juice very abundantly ; and the juice of the small purple berried juniper is of the same kind, being hard and fat, and not very gummy. If the bark of the common ivy is wounded in March, there will ooze out a tough and greafy matter of a yellowish colour, which, taken up between the fingers, feels not at all gummy or flicking, but melts in handling into a fort of oil, which in process of time hardens and crufts upon the wounds, and looks like brown fugar. It burns with a lasting flame, and fmells very ftrong. The tops of the wild lettuce, and the leaves growing near the tops, if examined with a magnifying glass, show a great number of small bladders or drops of an oily juice of a brownish colour, hardening into a kind of refin; they are eafily wiped off when of any fize, and are truly an oily juice a little hardened. It is probable also, that the fine blue flour or powder, called the bloom, upon the furface of our common plums, is no other than fuch an oily juice exfudating from their pores in fmall particles, and hardening into a fort of refin.

IUIUBES, in the materia medica, the name of a fruit of the pulpy kind, produced on a tree which Linnæus makes a species of rhamnus. See RHAMNUS.

The jujubes have been made a general ingredient in pectoral decoctions; but they are now feldom used on these occasions, and are scarce at all heard of in pre-

fcription, or to be met with in our shops. JUL, or Joz, a Gothic word fignifying a "fumptuous treat;" and particularly applied to a religious festival first among the heathens and afterwards among Christians. By the latter it was given to CHRISTMAS; which is fill known under the name of Jul, or Yool, in Denmark, Norway, Iceland, and Sweden; nay, even in the north of Britain, and whence the month of Januarius by the Saxons was styled Giuli, i. e. " the Feftival." As this feaft had originally been dedicated by our heathen ancestors to the fun, their supreme deity; fo the Christians, for the purpose of engaging the minds of their Ethnic (gentile) brethren, ordered it should be celebrated in memory of the birth of Christ : and thus it has been through ages a feast of joy and entertainment. We are indebted to Procopius for the first account of this feast.

JULEP, in pharmacy, a medicine composed of fome proper liquor and a fyrup or fugar, of extemporaneous preparation, without decoction. See PHAR-

JULIAN, the famous Roman emperor, flyled the Apostate, because he professed the Christian religion before he afcended the throne, but afterwards openly embraced Paganism, and endeavoured to abolish Christianity. He made no use of violence, however, for this purpose; for he knew that violent measures had always rendered it more flourishing : he therefore bethaved with a politic mildness to the Christians; recalled all who had been banished on account of religion 212der the reign of Constantius; and undertook to per-

stalks of the hendock also afford a fimilar oily liquor and mortifications covered over by artful pretences: but he forbad Christians to plead before courts of justice, or to enjoy any public employments. He even prohibited their teaching polite literature; well knowing the great advantages they drew from profane authors in their attacks upon Paganism and irreligion. Though he on all occasions showed a sovereign contempt for the Christians, whom he always called Galileans, yet he was fenfible of the advantage they obtained by their virtue and the purity of their manners; and therefore inceffantly proposed their example to the Pagan priefts. At last, however, when he found that all other methods failed, he gave public employments to the most cruel enemies of the Christians, when the cities in most of the provinces were filled with tumults and feditions, and many of them were put to death : Though it has been pleaded by fulian's apologifts that the behaviour of the Christians furnished sufficient pretence for most of his proceedings against them, and the animolities among themselves furnished him with the means; that they were continually prope to fedition, and made a merit of infulting the public worship; and, finally, that they made no fcruple of declaring, that want of numbers alone prevented them from engaging in an open rebellion. Historians mention, that Julian attempted to prove the falfehood of our Lord's prediction with respect to the temple of Terusalem: and resolved to have that edifice rebuilt by the Jews, about 300 years after its destruction by Titus: but all their endeavours ferved only the more perfectly to verify what had been foretold by Jesus Christ; for the Jews, who had affembled from all parts to Jerusalem, digging the foundations, flames of fire burft forth and confumed the workmen *. However, the Jews, who see Trwere obstinately bent on accomplishing that work, rusalem made feveral attempts; but it is faid, that all who endeavoured to lay the foundations perished by these flames, which at last obliged them entirely to abandon the work. Julian being mortally wounded in a battle with the Persians, it is said, that he then catched in his hand some of the blood which flowed from his wound; and throwing it towards heaven, cried, "Thou Galilean haft conquered." But notwithstanding this popular report, Theodoret relates, that Iulian differen vered a different disposition; and employed his last moments in converfing with Maximus the philosopher, on the dignity of the foul. He died the following night, aged 32. For a particular account of his reign and exploits, fee (Hiflory of) Constantinople, no 7.

No prince was ever more differently reprefented by different authors; on which account it is difficult to form a true judgment of his real character It musthowever, be acknowledged; that he was learned. liberal, temperate, brave, vigilant, and a lover of iuflice : but, on the other hand, he had apoflatifed to Paganifm; was an enemy to the Christian religion: and was, in fact, a perfecutor, though not of the most fanguinary class. We have feveral of his discourses or orations; fome of his letters; a treatife intitled Mi-Jopogon, which is a fatire on the inhabitants of Antioch ; and fome other pieces, all written in an elegant ftyle. They were published in Greek and Latin by father Petau in 1630 in quarto; and of which

Tullus Tuly.

Spanheimius gave a fine edition in folio in 1606. His melt famous work was that composed against the Christians, of which there are some fragments in Cyril's refutation of it.

FULIAN Period, in chronology, a period fo called, as

being adapted to the Julian year.

It is made to commence before the creation of the world. Its principal advantage lies here, that the fame years of the cycles of the fun, moon, and indiction, of which three cycles it was made to confift by Joseph Scaliger in 1580, belonging to any year of this period, will never fall together again till after the expiration of 7980 years. There is taken for the first year of this period that which hath the first of the cycle of the fun, the first of the cycle of the moon, and the first of the indiction cycle, and fo reckon-

The first year of the Christian era is always, in our fystems of chronology, the 4714th of the Julian

period.

To find what year of the Julian period any given year of Christ answers to: To the given year of Christ add 4713, because so many years of the Julian period were expired A. D. 1; and the fum gives the year of the Julian period fought.

On the contrary, having the year of the Julian period given, to find what year of Christ answers thereto: From the year of the Julian period given fubtract 4713, and the remainder will be the year fought.

JULIAN (St), a harbour on the fouth of Patagonia,

in South America, where ships usually touch that are bound to the fouth feas. S. Lat. 48. 15.

JULIERS, a duchy in the circle of Westphalia, in Germany, feated between the rivers Maefe and Rhine, and bounded by Pruffian Guelderland on the north, by the electorate of Triers on the fouth, by the electorate of Cologne on the east, and by the Netherlands on the west. It is about 60 miles long, and 30 broad; and is a very plentiful country, abounding in cattle, corn, and fine meadows, and is well supplied with wood; but it is most remarkable for a fine breed smooth. It is met with under stones, and in the of horses, and woad for dying, which is gathered here earth. 2. The fabulofus is of an ashen colour, smooth, in abundance. The chief towns are Juliers, Aix-la-Chapelle, Duren, Munfter-Eifel, Bedbur, Wefinburgh, and Lasteren. It is subject to the elector Palatine, with the confent of the kings of Prussia and Poland.

JULIERS, a city, capital of the duchy of Juliers in Westphalia; some think this city was founded by Julius Cæfar or Julia Agrippina; but this is much quepalace of the ancient dukes, and a spacious piazza. nobly endowed by feveral dukes of Juliers. The town species is but poorly inhabited, though they have a fine wool-

JULIO ROMANO. See ROMANO.

JULIUS CÆSAR. See CÆSAR. Tulius II. (Julian de la Rovere), pope, remarkable for his warlike disposition, and his political negociations: by the latter, he engaged the principal powers of Europe to league with him against the republic of Venice, called the league of Cambray, fignified in 1508. The Venetians having purchased peace by the cession of part of Romania, Julius turned his arms against Louis XII, king of France, and appeared in person, armed cap a pee, at the siege of Mirandola; which place he took by affault in 1511. But proceeding to excommunicate Louis, the king wifely turned his own weapons against him, by calling a general council at Pifa; at which the pope refufing to appear. was declared to be suspended from the holy see; and Louis, in his turn, excommunicated the pope, who died foon after in 1512. He built the famous church of Sr Peter at Rome, and was a patron of the polite arts.

Julius Vicus (anc. gee;), a town of the Nemetes in Gallia Belgica; fituated between the Tres Tabernae and Noviomagus. Now Germer/beim, a town of the Lower Palatinate, on the west side of the

Rhine. E. Long. 8. 15. Lat. 49, 12. FULIUS Pollum. See POLLUX.

IULUS, a fon of Afcanius, born in Lavinium. In the fucceffion to the kingdom of Alba, Æneas Sylvius, the fon of Æneas and Lavinia, was preferred to him.

He was, however, made chief prieft

IULUS, in zoology; a genus of infects of the order aptera. The feet are very numerous, being on each fide twice as many as the fegments of the body: the antennæ are moniliform; there are two articulated palpi; and the body is of a femicylindrical form. 1. The terrestris is a small species, having on each fide 100 very fhort closely fet feet. The body is cylindrically round, confilling of fifty fegments, each of which gives rife to two pair of feet; by which means the feet fland two and two by the fide of each other, fo that between every two there is a little more fpace. Its colour is blackifh, and the animal is very and fometimes has two longitudinal bands of a duncolour upon its back. The body is composed of about fixty fegments, which appear double; one part of the fegment being quite smooth, the other charged with longitudinal striæ very close-set together, which causes the cylindric body of the insect to appear interfected alternately with fmooth and firiated fegments. Each fegment gives rife to two pair of feet, which flioned by others, because it is not mentioned before makes 240, or 120 feet on each side. These feet are Antoninus's Itinerary and Theodofius's Tables. The flender, flort, and white. The antennæ are very flort, town is small but well fortified, and neatly built; the and confift of five rings. The infect, when touched, houses are of brick, and the freets broad and regular. rolls itself up into a spiral; fo that its feet are inwards, The citadel is large and very strong, containing a but yet turned towards the ground. It is found together with the preceding one, to which it bears a re-In the suburbs there is a monastery of Carthusians, semblance, though it is much larger. There are other

JULY, the seventh month of the year; during len manufactory in this country, and likewife another which the fun enters the fign Leo. The word is deof linen. It was taken by prince Maurice of Nassau rived from the Latin Julius, the furname of C. Cæsar in 1610, and by the Spaniards in 1622. It is feated the dictator, who was born in it. Mark Antony find on the river Roer, in E. Long. 6. 35. N. Lat. 50. 55. gave this month the name July, which before was called Quintilius, as being the fifth month of the year in

the old Roman kalendar established by Romulus, which the Maese, where they sometimes arrive at the height began in the month of March. For the same reason, August was called Sextilis; and September, October, November, and December, still retain the name of their first rank.

Due fequitur, numero turba notata fuo. Ovid. Fast. On the 19th day of this month the dog-days are commonly supposed to begin; when, according to Hippocrates and Pliny, the fea boils, wine turns four, dogs go mad, the bile is increased and irritated, and all animals decline and languish.

FULT-Flowers. See DIANTHUS.

IUMIEGE, a town of Normandy in France, and in the territory of Caux, with a celebrated Benedictine abbey. It is feated on the river Seine, in E.

Long. 0. 55. N. Lat. 49. 25.
JUNCI LAPIDEI, in natural history, the name given by authors to a species of fossile coral, of the tubularia kind, and composed of a congeries of small tubules, which are ufully round and striated within. See Plate CC

IUNCTURE, any joint or clofing of two bodies.

See JOINT.

~ Tuty

Juncus.

JUNCTURE, in cratory, is a part of composition, particularly recommended by Quintilian, and denotes fuch an attention to the nature of the vowels, confonants, and fyllables, in the connection of words, with regard to their found, as will render the pronunciation most easy and pleasant, and best promote the harmony of the fentence. Thus the coalition of two vowels, occasioning an hollow and obscure found, and likewife of fome confonants, rendering it harsh and rough, should be avoided: nor should the same syllable be repeated at the beginning and end of words, because the found becomes hereby harsh and unpleasant. The following verse in Virgil's Æneid is an example of

Arma virumque cano, Troja qui primus ab oris.

JUNCUS, the RUSH, in botany: A genus of the monogynia order belonging to the hexandria class of plants; and in the natural method ranking under the 5th order, Tripelatoidea. The calyx is hexaphyllous; there is no corolla; the capfule is unilocular. There are many species which are universally known, being very troublesome weeds, and difficult to be eradicated. The pith of two kinds, called the conglomeratus and effusus, or round-headed and fost rushes, are See Ruft- used for wicks to lamps and rush-lights*. The conglomeratus, and aculus or marine rush, are planted with great care on the banks of the fea in Holland, in order to prevent the water from washing away the earth; which would otherwise be removed every tide, if it were not for the roots of those rushes, which fasten very deep in the ground, and mat themselves near the furface in fuch a manner as to hold the earth closely together. Therefore, whenever the inhabitants perceive that the roots of these rushes are deftroyed, they are very affiduous in repairing them. In the fummer time when the rushes are fully grown, they are cut and tied up in bundles, which are dried, and afterwards carried into the larger towns and cities, where they are wrought into balkets, and feveral other useful things, which are frequently sent into England. These forts do not grow so ftrong in this country as on Nº 170.

of four feet and upwards. A species of rush termed juncus odoratus, " sweet Juniperus

rush, or camel's hay," is fometimes brought to us from Turkey and Arabia, tied up in bundles about a foot long. 'The stalk, in shape and colour, somewhat refembles a barley-ftraw; it is full of fungous pith like that of our common rushes: the leaves are like those of wheat, and furround the stalk with several coats, as in the reed. The flowers are of a carnation colour, ftriped with a lighter purple. The whole plant, when in perfection, has a hot, bitterifh, not unpleafant, aromatic tafte, and a very fragrant fmell: by long keeping it lofes greatly its aromatic flavour. Distilled with water, it yields a considerable quantity of an effential oil. It was formerly often used in medicine as an aromatic, and in obstructions of the viscera, &c. but is very little employed at prefent.

JUNE, the fixth month of the year, during which the fun enters the fign of Cancer. The word comes from the Latin Junius, which some derive à Junone. Ovid, in the 6th of his Fasti, makes the goddels fay,

Junius à nostro nomine nomen habet. Others rather derive it à junioribus, this being for young

people as the month of May was for old ones.

Junius est juvenum; qui fuit antè senum. In this month is the fummer folftice.

JUNGERMANNIA, in botany: A genus of the natural order of algæ, belonging to the cryptogamia class of plants. The male flower is pedanculated, and naked; the anthera quadrivalved; the female flower is feffile, naked, with roundish feeds. There are 29 species, all natives of Britain, growing in woods, shady places, by the fides of ditches, &c. Many of them are beautiful objects for the microscope.

JUNGIA, in botany: A genus of the polygamia fegregatæ order, belonging to the syngenesia class of plants; the common receptacle is chaffy; the perianthium three-flowered; the florets tubular, two-lipped; the exterior lip ligulate; the interior one bipartite.

JUNIPERUS, the JUNIPER TREE: A genus of the monodelphia order, belonging to the monœcia class of plants; and in the natural method ranking under the 51st order, Conifera. The male amentum is a calyx of scales; there is no corolla; three stamina: the female calyx tripartite; there are three petals; and as many styles; the berry is trispermous, and equal by means of three tubercles of the indurated calyx adhering to it.

Species. 1. The communis, or common juniper, grows naturally in many parts of Britain upon dry barren commons, where it feldom rifes above the height of a low shrub. Mr Evelyn affures us, that " the juniper, though naturally of the growth of England, is very little known in many parts of the country: for it grows naturally only in dry, chalky, or fandy land; and, where the foil is opposite to this, the plant is rarely found. Those who have been used to see it in its wild state, on fandy barren commons, &c. will have little inducement to plant it; as there they will fee it procumbent, feldom showing a tendency to aspire : but when planted in a good foil, it will rife to the height of 15 or 16 feet, and produce numerous branches from

Wights.

Juniperus, the bottom to the top, forming a well-looking bushy ing crowded, the stem-leaves threefold, the branch- Juniperus, plant. These branches are exceeding tough, and co- leaves fourfold. vered with a smooth bark of a reddish colour, having Culture. The propagation of all the junipers is by

a tinge of purple. The leaves are narrow and sharppointed, growing by threes on the branches: their upper furface has a greyish streak down the middle; but their under furface is of a fine green colour, and they garnish the shrub in great plenty. The flowers are small, and of a yellowish colour. They are succeeded by the berries, which are of a bluish colour when ripe." Of this species there is a variety called Swedish juniper, which grows 10 or 12 feet high, very branchy the whole length, with the branches growing more erect, and leaves, flowers, and fruit, like the former. But Mr Miller affirms the Swedish juniper to be a distinct species. A prostrate and very dwarfish variety is mentioned by Mr Lightfoot, under the name of dwarf Alpine juniper. It is frequently found in the mountains in the Highlands of Scotland, and has broader and thicker leaves than the former; the berries are also larger, or more oval than soherical, 2. The oxycedrus, or Spanish juniper, rises from 10 to 15 feet high, closely branched from bottom to top; having fhort, awl-shaped, spreading leaves by threes, and small diocicus flowers, fucceeded by large reddifh brown berries. 3. The thurifera, or blue berried Spanish juniper, grows 20 feet high or more, branching in a conic form, with acute imbricated leaves growing by fours, and finall diocious flowers, fucceeded by large blue flowers. 4. The Virginiana, or Virginia cedar, grows 30 or 40 feet high, branching from bottom to top in a conic manner, fmall leaves by threes adhering at their base; the younger ones imbricated, and the old ones spreading; with diccious flowers, succeeded by fmall blue berries 5. The Lycia, Lycian cedar, or olibanum tree, grows 20 feet high, branching erect; garnished with small obtuse oval leaves, every-where imbricated; having directious flowers, fucceeded by large oval brown berries. It is a native of Spain and Italy. 6. The Phanicia, or Phenician cedar, grows about 20 feet high, branching pyramidally; adorned with ternate and imbricated obtuse leaves; and dicecious flowers, fucceeded by fmall yellowish berries. It is a native of Portugal. 7. The Bermudiana, or Bermudian cedar, grows 20 or 30 feet high, has fmall acute leaves by threes below, the upper ones awlshaped, acute, and decurrent, by pairs or fours, spreading outward, and diccious flowers, fucceeded by purplish berries. It is a native of Bermudas. 8. The Sabina, or favin tree; of which there are the following varieties, viz. fpreading, upright, and variegated favin .. The first grows three or four feet high, with horizontal and very fpreading branches; with short, pointed, decurrent, erect, opposite leaves; and dicecious flowers, fucceeded by bluish berries, but very rarely producing either flowers or fruit. The fecond grows eight or ten feet high, with upright branches, dark-green leaves like the former, and diccious flowers, fucceeded by plenty of berries. The third has the ends of many of the shoots and young branches variegated with white, and the leaves finely striped; fo that it makes a beautiful appearance. There are two other species; the Barbadenfis, with leaves all imbricated fourways, the younger ones ovate, the elder acute; and the Chinensis, with leaves decurrent imbricate-expand. The Laplanders, as we are told by Linnæus, drink Vol. IX. Part II.

feed, and of the favins by layers and cuttings; but these last may also be raised from the berries, if they can be procured. They may all be fowed in beds of common light earth; except the cedar of Bermudas. which must be fowed in pots, to have shelter in winter. When the hardy kinds have had two or three years growth in the feed bed, they may be planted out in autumn or in fpring, in nurfery-rows two feet afunder, there to remain till of due fize for final transplantation into the shrubbery. The Bermudas cedar must be sheltered under a frame for the first year or two: when they must be separated into small pots, to be sheltered also in winter for three or four years, till they have acquired fome fize and strength; then turned out into pots in the full ground, where they are to remain in a warm fituation; though a shelter of mats for the first winter or two during hard frosts will be of great fervice. The feafon for transplanting all the forts is either in autumn, October, or November, or in March. and early in April.

Uses, &c. Juniper-berries have a strong, not disa-greeable smell; and a warm, pungent, sweet taste; which, if they are long chewed, or previously well bruised, is followed by a bitterish one. The pungency feems to refide in the bark; the fweet in the juice; the aromatic flavour in oily vesicles spread through the fubstance of the pulp, and distinguishable even by the eye; and the bitter in the feeds. The fresh berries yield, on expression, a rich, sweet, honey-like aromatic juice; if previously pounded so as to break the feeds, the juice proves tart and bitter .- These berries are useful carminatives and stomachies: for these purposes a spirituous water and essential oil are prepared from them, and they are also ingredients in various medicines. The liquor remaining after the distillation of the oil paffed through a strainer, and gently exhaled to the confistence of a rob, proves likewife a medicine of great utility, and in many cases is perhaps preferable to the oil or the berry itself. Hoffman is expressly of this opinion, and recommends the rob of juniper in debility of the stomach and intestines; and fays it is particularly ferviceable to old people who are fubject to these disorders, or labour under a difficulty with regard to the urinary fecretion. This rob is of a dark brownish-yellow colour, a balfamic fweet taste, with a little of the bitter, more or less according as the feeds in the berry have been more or less bruised. But perhaps one of the best forms under which they can be used is that of a simple watery infusion. This, either by itself or with the addition of a small quantity of gin, is a very ufeful drink for hydropic patients. An infusion of the tops has also been advantageously employed in the fame manner. The Swedes prepare an extract from the berries, probably of the nature of the rob above mentioned, which some eat for breakfast. In Germany the berries are bruifed and put into the fauce made use of for a wild boar; and are frequently also eaten with other pork, to give it a wild-boar flavour. In Carniola, and fome other diffricts, the inhabitants make a kind of wine of them steeped in water : but it is difficult to prevent this liquor from growing four.

infulions

Thrushes and grous feed on the berries, and diffeminate the feed in their dung. It is remarkable that the berries of the juniper are two years in ripening. They fometimes appear in an uncommon form; the leaves of the cup grow double the usual fize, approaching, but not clofing; and the three petals fit exactly clofe, fo as to keep the air from the tipule juniperi which inhabit them. - The whole plant has a strong aromatic smell. The wood when burnt emits a fragrant odour like incense. It is of a reddish colour, very hard and durable; and when large enough, is used in marquetry and veneering, and in making cups, cabinets, &c. Grafs will not grow beneath juniper, but this tree itself is faid to be destroyed by the meadow-oat. The oil of juniper mixed with that of nuts makes an excellent varnish for pictures, wood work, and preserving iron from rufting. The refin powdered and rubbed into paper prevents the ink from finking through it. for which it is frequently used under the name of POUNCE .- The charcoal made from this wood endures longer than any other, infomuch that live embers are faid to have been found in the ashes after being a year covered .- For the properties of fome other species, fee the articles SANDARACH (Gum), and OLIBA-NUM

IUNIUS (Adrian), one of the most learned men of the age in which he lived, was born at Horn in Holland in 1511. He travelled into all parts of Europe, and practifed physic with reputation in England; where, among other works, he composed a Greek and Latin Lexicon, to which he added above 6500 words; an Epithalamium on the marriage of queen Mary with king Philip of Spain; and Animadversa & de Coma Commentarius, which is the most applauded of

all his works. He died in 1575.

Junius (Francis), professor of divinity at Leyden, was born at Bourges in 1545, of a noble family, and fludied fome time at Lyons. Bartholomew Aneau, who was principal of the college in that city, gave him excellent instructions with regard to the right method of studying. He was remarkable for being proof against all temptations to lewduess; but a libertine so far overpowered him by his fophistry, that he made him an atheist: however, he foon returned to his first faith; and, averse as he was to unlawful love, he had no aversion to matrimony, but was married no less than four times. He was employed in public affairs by Henry IV.; and at last was invited to Leyden to be professor of divinity, which employment he difcharged with honour, till he was inatched away by the plague in 1602. Du Pin fays, he was a learned and judicious critic. He wrote, in conjunction with Emmanuel Tremellius, a Latin version of the Hebrew text of the Bible. He also published Commentaries on a great part of the Holy Scriptures; and many other works, all in Latin.

JUNIUS (Francis), or Francis du Jon, the fon of the preceding, was born at Heidelberg in 1589. He at first designed to devote himself to a military life; but after the truce concluded in 1609, he applied himfelf entirely to study. He came to England in 1620, and lived 30 years in the earl of Arundel's family. He was greatly efteemed not only for his profound erudition, but also for the purity of his manners; and was

Junius, infusions of the juniper berries as we do tea and coffee. fo passionately fond of the study of the northern languages, that, being informed there were fome villages in Friefland where the ancient language of the Saxons was preserved, he went and lived two years in that country. He returned to England in 1675; and after spending a year at Oxford, retired to Windsor, in order to visit Vossius, at whose house he died in 1677. The university of Oxford, to which he bequeathed his manuscripts, erected a very handsome monument to his memory. He wrote, 1. De Pictura Veterum, which is admired by all the learned; the best edition of it is that of Rotterdam in 1694. He published the same work at London in English. 2. An explication of the old Gothic manuscript, called the Silver one, because the four Gofpels are there written in filver Gothic letters : this was published with notes by Thomas Mareschal. or Marshal. 3. A large Commentary on the Harmony of the four Gospels by Tatian, which is still in manuscript. 4. A Glossary in five languages, in which he explains the origin of the Northern languages; published at Oxford in 1745, in solio, by Mr Edward

JUNK, in fea-language, a name given to any remnants or pieces of old cable, which is usually cut intofmall portions, for the purpose of making points, matts,

gaskets, sennit; &c.

JUNO, in pagan worship, was the fifter and wife of Jupiter, and the goddess of kingdoms and riches; and also styled the queen of beaven: she presided over marriage and child birth, and was reprefented as the daughter of Saturn and Rhea. She married Juniter: but was not the most complaifant wife : for, according to Homer, that god was fometimes obliged to make use of all his authority to keep her in due subjection; and the same author observes, that on her entering into a conspiracy against him, he punished her by suspending her in the air with two anvils fastened to her feet, and golden manacles on her hands, which all the other deities looked on without a poffibility of helping her. However, her jealoufy made her frequently find opportunities of interrupting her hufband in the course of his amours; and prompted her to punish with unrelenting fury Europa, Semele, Io, Latona, and the reft of his mistresses. Jupiter himself having conceived without any commerce with a female, Juno, in revenge, conceived Vulcan by the wind, Mars by touching a flower pointed out to her by the goddess Flora, and Hebe by eating greedily of lettuces.

Juno, as the queen of heaven, preserved great state: her usual attendants were Terror and Boldness, Castor, Pollux, and 14 nymphs; but her most faithful attendant was the beautiful Iris, or the rainbow. Homer describes her in a chariot adorned with precious stones, the wheels of which were of ebony, and which was drawn by horses with reins of gold. But she is more commonly painted drawn by peacocks. She was reprefented in her temple at Corinth, feated on a throne, with a crown on her head, a pomegranate in one hand, and in the other a fceptre with a cuckoo on its top.

This statue was of gold and ivory.

Some mythologists suppose that Juno signifies the air: others, that she was the Egyptian Isis; who being represented under various figures, was by the Greeks and Romans represented as so many distinct deities.

Tunonalia. Janiter.

See Ele

in honour of Juno. It was instituted on account of certain prodigies that happened in Italy, and was celebrated by matrons. In the folemnity two white cows were led from the temple of Apollo into the city thro' the gate called Carmentalis, and two images of Juno. made of cypress, were born in procession. Then marched 27 girls, habited in long robes, finging an hymn to the goddess; then came the Decemviri, crowned with laurel, in vestments edged with purple. This pompous company, going through the Vicus Jugarius, had a dance in the great field of Rome; from thence they proceeded through the Forum Boarium to the temple of Juno, where the victims were facrificed by the Decemviri, and the cypress images were left standing. This festival is not mentioned in the fasti of O. vid, but is fully described by Livy, lib. 7. dec. 3. The hymn used upon the occasion was composed by Livius the poet.

JUNTO, in matters of government, denotes a felect council for taking cognizance of affairs of great confe-

quence, which require fecrecy.

In Spain and Portugal, it fignifies much the fame with convention, affembly, or board among us: thus we meet with the junto of the three estates, of commerce, of tobacco, &c. See BOARD, &c.

IVORY, in natural history, &c. a hard, folid, and firm fubstance, of a white colour, and capable of a very good polish. It is the tusk of the elephant *; and is hollow from the base to a certain height, the cavity being filled up with a compact medullary fubilance, feeming to have a great number of glands in it. It is observed, that the Ceylon ivory, and that of the island of Achem, do not become yellow in the wearing, as all other ivory does; for this reason the teeth of thele places bear a largerprice than those of the coast of Guinea, Hardening, Softening, and Staining, of Ivory. See

Bones and Horns.

JUPITER, the supreme god of the ancient pagans. The theologists, according to Cicero, reckoned up three Jupiters; the first and second of whom were born in Arcadia; of these two, the one sprang from Æther, the other from Colus. The third Jupiter was the fon of Saturn, and born in Crete, where they pretended to flow his fepulchre. Cicero in other places speaks of several Jupiters who reigned in other places peaks of reversily upiters, by whom the poets and divines understand the supreme god, was the son of Saturn king of Crete. He would have been devoured by his father as foon as born, had not his mother Rhea substituted a stone instead of the child. which Saturn immediately fwallowed. Saturn took this method to deftroy all his male children, because it had been foretold by Cœlus and Terra, that one of his fons should deprive him of his kingdom. Jupiter. being thus faved from his father's jaws, was brought up by the Curetes in a den on mount Ida. Virgil tells us, that he was fed by the bees; out of gratitude for which, he changed them from an iron to a golden colour. Some fay, that his nurses were Amalthæa and Meliffa, who gave him goats milk and honey; and others, that Amalthæa was the name of the goat which nourished him, and which, as a reward for her great fervices, was changed into a confellation. According to others, he was fed by wild pigeons, who brought

IUNONALIA, a festival observed by the Romans him ambrosia from Oceanus; and by an eagle, who Jupitee. carried nectar in his beak from a fteep rock : for which he rewarded the former, by making them the foretellers of winter and fummer; and the last by gi-, ving him immortality, and making him his thunderbearer. When grown up, he drove his father out of heaven, and divided the empire of the world with his brothers. For himself, he had heaven and earth. Neptune had the fea and waters; and Pluto hell. The Titans undertook to destroy Jupiter, as he had done his father. These Titans were giants, the sons of Titan and the Earth. They declared war against Jupiter, and heaped mountains upon mountains, in order to scale heaven : but their efforts were unsuccess-Jupiter overthrew them with his thunder, and flut them up under the waters and mountains, from which they were not able to get out.

Jupiter had feveral wives: the first of whom, named Metis, he is faid to have devoured when big with child, by which he himself became pregnant; and Minerva issued out of his head, completely armed and fully grown. His fecond was Themis; the name of his third is not known; his fourth was the celebrated Juno, whom he deceived under the form of a cuckoo, which to shun the violence of a storm fled for shelter to her lap. He was the father of the Muses and Graces; and had a prodigious number of children by his miftreffes. He metamorphofed himfelf into a fatyr to enjoy Antiope; into a bull, to carry off Europa; into a fwan, to abuse Leda; into a shower of gold, to corrupt Danae; and into feveral other forms to gratify his passions. He had Bacchus by Semele, Diana and Apollo by Latona, and was the father of Mercury

and the other gods.

The heathens in general believed that there was but one fupreme God: but when they confidered this one great being as influencing the affairs of the world. they gave him as many different names; and hence proceeded their variety of nominal gods. When he thundered or lightned, they called him Jupiter; when he calmed the fea, Neptune; when he guided their councils, Minerva; and when he gave them ftrength in battle, Mars. In process of time they used different representations of this Jupiter, &c and considered them, vulgarly at leaft, as fo many different perfons, They afterward regarded each of them in different views : e. g. The Jupiter that showered down bleslings, was called the Kind Jupiter; and when punishing, the Terrible Jupiter. There was also one Jupiter for Europe, and another for Africa; and in Europe, there was one great Jupiter who was the particular friend of the Athenians, and another who was the special protector of the Romans: nay, there was fcarce a town or hamlet perhaps, in Italy, that had not a Jupiter of its own; and the Jupiter of Terracina or Jupiter Anxur, represented in medals as young and beardless, with rays round his head, more refembled Apollo than the great Jupiter at the Capitol. In this way Jupiter at length had temples and different characters almost every where: at Carthage, he was called Ammon; in Egypt, Serapis; at Athens, the great Jupiter was the Olympian Jupiter; and at Rome the greatest Jupiter was the Capitoline Jupiter, who was the guardian and benefactor of the Romans, and whom they called the "best and greatest Jupiter;" Jupiter optimus

maximus.

404

Jupiter. maximus. The figure of this Jupiter was represented in his chief temple on the Capitoline hill, as fitting on a curule chair, with the fulmen or thunder, or rather lightning, in one hand, and a fceptre in the other. This fulmen in the figures of the old artifts was always adapted to the character under which they were to represent Jupiter. If his appearance was to be mild and calm, they gave him the conic fulmen or bundle of flames wreathed close together, held down in his hand : When punishing, he holds up the same figure, with two transverse darts of lightning, sometimes with wings added to each fide of it, to denote its fwiftness; this was called by the poets the threeforked bolt of Jove: and when he was going to do fome exemplary execution, they put in his hand a handful of flames, all let loofe in their utmost fury ; and fometimes filled both his hands with flames. The fuperiority of Jupiter was principally manifested in that air of majesty which the ancient artists endeavoured to express in his countenance; particular attention was paid to the head of hair, the eye-brows, and the beard. There are feveral heads of the mild Jupiter on ancient feals; where his face has a mixture of dignity and eafe in it, admirably described by Virgil, Æn. i. v. 256. The statues of the Terrible Jupiter were generally of black marble, as those of the former were of white: the one fitting with an air of tranquillity; the other standing, more or less disturbed. The face of the one is pacific and ferene; of the other angry or clouded. On the heads of the one the hair is regular and composed; in the other it is so discomposed, that it falls half-way down the forehead. The face of the Jupiter Tonans resembles that of the Terrible Jupiter; he is reprefented on gems and medals as holding up the triple bolt in his right hand, and flanding in a chariot, which feems to be whirled on impetuoufly by four horfes. Thus he is also described by the poets. Ovid. Deian. Herc. v. 28. Horace lib. i. od. 4. v. 8. Jupiter, as the intelligence prefiding over a fingle planet, is represented only in a chariot and pair: on all other occafions, if reprefented in a chariot, he is always drawn by four horfes. Jupiter is well known as the chief ruler of the air, whose particular province was to direct the rains, the thunders, and the lightnings. As the difpenser of rain, he was called Jupiter Pluvius: under which character he is exhibited feated in the clouds, holding up his right hand, or extending his arms almost in a straight line each way, and pouring a stream of hail and rain from his right hand upon the earth; whilft the fulmen is held down in his left. The wings that are given him relate to his character of prefiding over the air; his hair and beard in the Antonine pillar are all fpread down by the rain, which defcends in a sheet from him, and falls for the refreshment of the Romans; whilft their enemies are reprefented as ftruck with the lightnings, and lying dead at their feet.

Some confider a great part of the fable of Jupiter to include the history of Noah and his three sons; and that Saturn is Noah, who faw all mankind perish in the waters of the deluge; and who, in some fort, swallowed them up, by not receiving them into the ark. Jupiter is Ham; Neptune Japheth; and Shem, Pluto.

The Titans, it is thought, represent the old giants, who built the tower of Babel, and whose pride an

prefumption God had confounded, by changing their Jupiter, language, and pouring out the spirit of discord and division among them. The name of Jupiter, or Jovis Pater, is thought to be derived from Jehovah, pronounced with the Latin termination Jovis instead of Jova; and in medals we meet with Fovis in the nominative, as well as oblique cases: for example Jovis cuftos, Jovis propugnator, Jovis stator. To the name Jovis was added pater; and afterwards instead of " Jovis pater", Jupiter was used by abbreviation.

The name Jupiter was not known to the Hebrews till the reign of Alexander the Great, and the kings his fuccesfors. Antiochus Epiphanes commanded the idol of Jupiter Olympius to be placed in the temple at Jerusalem; and that of Jupiter the defender of ftrangers in the temple on mount Gerizim. 2 Macc. vi. 2. While St Paul and St Barnabas were at Lyftra, they were taken for gods, because they cured one who had been lame from his birth, and that by an expression only: St Paul was taken for Mercury, by reason of his eloquence; and St Barnabas for Jupiter (Acts xiv. 11, 12.), on account probably of his good mein.

JUPITER, 4, in astronomy, one of the superior planets, remarkable for its brightness; and which by its proper motion feems to revolve round the earth in about twelve years. See Astronomy-Index.

JURA, one of the Hebrides, or Western Islands of Scotland, lying opposite to Knapdale in Argyleshire, is supposed to be about 34 miles long and 10 broad. It is the most rugged of all the Hebrides; and is composed chiefly of vast mountains, naked, and without a poffibility of cultivation. Some of the fouth and western fides only are improveable, and in good feafons as much bear and oats are raifed as will maintain the inhabitants; though by the distillation, as Mr Pennant fuppofes, of their grain, they fometimes want. Bear produces four or five fold, and oats three fold. Sloes are the only fruits of the island. An acid for punch is here made from the berries of the mountain-ash; and a kind of spirit is also distilled from them. Necessity hath instructed the inhabitants in the use of native dyes. Thus the juice of the tops of heath boiled fupplies them with a yellow; the roots of the white water-lily with a dark-brown; those of the yellow water iris with a black; and the galium verum, ru of the islanders, with a very fine red, not inferior to madder. On the hills is some pasture for cattle; and the produce, when Mr Pennant vifited the ifland, amounted to about 300 or 400 head of black cattle, fold annually at 31. each to graziers who come for them; about 100 horses also fold annually; a few sheep with sleeces of a most excellent quality, and great numbers of goats. The other animals of Jura are about 100 flags; though these must formerly have been much more numerous, as the original name of the island was Deir-ay, or the ifle of deer, fo called by the Norwegians on account of the abundance of deer found in it. Here also Mr Pennant had fome obscure account of a worm that, in a less pernicious degree, refembles the FURIA infernalis of Linnæus. The fillan, a little worm of Jura, fmall as a thread, and not an inch in length, infinuates itself under the skin, causes a redness and great pain, flies swift. ly from place to place; but is cured by a poultice of cheefe and honey. Of the mountains of Jura, those from their shape called the paps, are the most remark. able. There are only three very large ones; the biggett, called Beinn-an-oir, or the mountain of gold, lies farthed to the north; the fecond is called Beinn-sheunta, or the ballowed mountain; and the third, Beinn-a-chaolois, or the mountain of the found, is the least of the three, Mr Pennant ascended the first with great labour and difficulty. It is composed of vast stones, covered with moffes near the base; but all above bare and unconnected with each other. The whole, he fays, feems a cairn, the work of the fons of Saturn. The grandeur of the prospect from the top abundantly made amends for the fatigue of ascending the mountain. Jura itself afforded a stupendous scene of rock, varied with innumerable little lakes. From the west fide of the hill ran a narrow stripe of rock terminating in the sea, and called the flide of the old hag. To the fouth appeared Ilay extended like a map beneath his feet; and beyond that the north of Ireland; to the east two other islands, Cantyre, Arran, and the frith of Clyde bounded by Ayrihire; an amazing tract of mountains to the northeast as far as Ben-lomond; Skarba finished the northern view; and over the western ocean were scattered Colonfay and Oranfay, Mull, Iona, and its neighbouring ifles; and still further, the long extents of Tirey and Col, just apparent. The other paps are feen very diflinctly, but all of them inferior in height. Mr Banks and his friends mounted that to the fouth, and found the height to be 2359 feet; but this is far overtopped by Beinn-an-oir. The stones of this mountain are white, a few red, quartzy, and composed of small grains; but fome are breciated or filled with cryftalline kernels of an amethystine colour. The other stones of the island are, a cinereous slate, veined with red, and used here as a white-stone; a micaceous sand-stone; and between the fmall isles and Arfin, a micaceous quartzy rock flone. On the west fide of the island there is an anchoring-place called Whitfarlan : towards the north end is a bay called Da'l yaul; and on the fame coast is formed another riding-place for vessels among feveral fmall islands. Between the north end of Jura and the small isle of Skarba, there is a famous whirlpool, called Cory Vrekan, from Brecan, fon to a king of Denmark, who perished in this gulph. His body being cast ashore on the north fide of Jura, was buried in a cave, and his grave is still distinguished by a tombstone and altar. In this vortex, which extends about a mile in breadth, the fea begins to boil and ferment with the tide of flood, increasing gradually to a number of whirlpools, which, in the form of pyramids, fpout up the water with a great noise, as high as the mast of a small vessel, agitated into such a foam as makes the fea appear white even at the distance of two leagues. About half flood the violence begins to decrease, and continues to do fo till about half an hour after high-water: then it boils as before, till within an hour of low-water, when the smallest fishing boat may cross it without danger.

Jura is furnified with many rivulets and fprings of excellent water, and the air is remarkably healthy; its falobity being increased by the high fituation, perpetually fanned by breezes. It is, however, but il-peopled; and did not contain above 700 or 800 inhabitants at the time it was visited by Mi Pennant. The women are profise, and very often bear twins. The

inhabitants live to a great age, and are liable to few diftempers. Men of 90 can work; and three was then living a woman of 80, who could run down a fleep. The inhabitants are all Proteinants, but addicted to fome fuperfittions. The parish is fuppoled to be the largest in Great Britain, and the duty the most dangerous and troublefome: it consists of Jura, Oranfay, Colonfay, Skarba, and feveral little isles divided by narrow and dangerous founds; forming a length of not lefs than 60 miles; supplied by only one minister and an affiliata.

The very old clans of Jura are the Mac.itoups and the Mac.raines: but it feems to have changed mafters more than once. In 1549, Donald of Cantyre, Macguillayne of Doward, Mac.guillayne of Kinloch-büy, and Mac.duffie of Colonfay, were the proprictors: Mac.leau of Mull had allo a share in 1586. At prefent it belongs to the duke of Arzyle, Mr Macnell of

Colonfay, and Mr Campbell of Shawfield.

JURA is also the name of a chain of mountains in Switzerland, beginning in the canton of Zurich, extending from thence along the Rhine into the canton and bishopric of Basle, stretching into the canton of Soleura and the principality of Neuchatel, and branching out towards the Pays de Vaud ; feparating that county from Frenche Comte and Burgundy, and continued beyond the Genevan territories as far as the Rhone. Many elevated valleys are formed by different parts of this chain in the country of the Pays de Vaud; among which one of the most remarkable is the valley of the lake of Joux, on the top of that part of the chain named Mount Joux. It contains feveral populous viklages, and is beautifully diverlified with wood, arable land, and pasture. It is watered by two lakes; the largest of which is that of Joux already mentioned. This has one shore of a high rock covered with wood; the opposite banks forming a gentle ascent, fertile and well cultivated; behind which is a ridge covered with pines, beech, and oak wood. The fmaller lake, named Brenet, is bordered with fine corn-fields and villages; and the stream which iffues from it is lost in a gulf named Entonnoir, or the Funnel, where the people have placed feveral mills which are turned by the force of the falling current. The river Orbe iffues from the other fide of the mountain, about two miles from this place; and probably owes its origin to the fubterraneous stream just mentioned. The largest lake is supplied by a rivulet which iffues from the bottom of a rock. and lofes itself in it. The valley contains about 3000 inhabitants, remarkable for their industry. Some are watch-makers; but the greatest number employ themfelves in polishing crystals, granites, and marcasites. The country is much infested with bears and wolves, In afcending to this place there is a very extensive profpect of great part of the Pays de Vaud, the lake of Geneva, and that of Neuchatel, which from that high point of view appear to be nearly on a level; though M. de Luc found the latter to be 159 feet above the level of the lake of Geneva.

JURATS, JURATI, magistrates in the nature of ALDERMEN, for the government of feveral corporations. Thus we meet with the mayor and jurats of Maidstone, Rye, Winchelsea, &c.—So also Jerfey has a bailist and twelve jurats, or sworn affiliants, to govern the signal.

IVREA, an ancient and flrong town of Italy, in Piedmont, and capital of Canavez, with a ftrong fort, a bifliop's fee, the title of a marquifate, and an aucient castle. It is subject to the king of Sardinia, and seated on the river Doria between two hills, in E. Long.

7. 48. N. Lat. 45. 12.

JURIEU (Peter), an eminent French Protestant divine, called ironically by the papilts the Goliath of the Protestants, was born in 1637. He was educated in England under his maternal uncle Peter du Moulin, and took orders in the English church; but returning to fucceed his father as paftor of a reformed congregation at Mer in the diocefe of Blois, he was made professor of divinity and Hebrew at Sedan, where he acquired great reputation. This univerfity being taken from the Protestants, a professorship of divinity was founded for him at Rotterdam; and he was also appointed minister of the Walloon church in the same town. Being now in a place of liberty, he gave full fcope to an imagination naturally warm, and applied himself to study the book of Revelation, of which he fancied he had by a kind of infpiration discovered the true meaning; a notion that led him to many enthusiaftical conjectures. He was moreover fo unfortunate as to quarrel with his best friends for opposing his vifionary opinions, which produced violent difputes between him and Messirs Bayle and de Beauval. He died in 1713; and left a great number of esteemed works behind him.

JURIN (Dr James), a diftinguished perfon, who cultivated medicine and mathematics with equal fuccefs. He was fecretary of the Royal Society in London, as well as prefident of the College of Phylicians there. He had great disputes with Michelloti upon the moment of running-waters, with Robins upon diflinct vision, and with the partizans of Leibnitz upon moving bodies A treatife of his "upon Vifion" is printed in Smith's "Optics." He died in 1750.

JURISCONSULTUS (ICtus,) among the Romans, was a perfon learned in the law; a mafter of the Roman jurifprudence; who was confulted on the interpretation of the laws and customs, and on the difficult points in law-fuits. The fifteen books of the Digefts were compiled wholly from the answers or reports of the ancient jurifconfulti. Tribonianus, in destroying the 2000 volumes from whence the code and Digest were taken, has deprived the public of a world of things which would have given them light into the arcient office of the jurisconfulti. We should scarce have known any thing beyond their bare names, had not Pomponius, who lived in the fecond century, taken care to preserve some circumitances of their office.

The Roman jurisconfulti feem to have been the same with our chamber counfellors, who arrived at the honour of being confulted through age and experience, but never pleaded at the bar. Their pleading advocates or lawyers never became jurifconfulti. See An-

In the times of the commonwealth, the advocati had by much the more honourable employment, as being in the ready way to attain the highest preferments. They then despised the jurisconsulti, calling them in to which a lesser yard, ropes, and fails, are affixed. derition formularii and legulei, as having invented certain forms and monofyllables, in order to give their cassion.

But in process of time they became so much esteemed, that they were called prudentes and fapientes, and the emperors appointed the judges to follow their advice. Augustus advanced them to be public officers of the empire; fo that they were no longer confined to the petty counfels of private perfons .- Bern. Rutilius has written the lives of the most famous jurisconfulti who have lived within these 2000 years.

JURISDICTION, a power or authority, which a man has to do justice in cases of complaint made before him. There are two kinds of jurifdiction, the

one ecclefiastical, the other secular.

Secular FURISDICTION, belongs to the king and his juffices or delegates. The courts and judges at Weltminfter have jurifdiction all over England, and are not rettrained to any county or place; but all other courts are confined to their particular jurifdictions, which if they exceed, whatever they do is erroneous. There are three forts of inferior jurifdictions; the first is tenere placita, to hold pleas, and the plaintiff may fue either there or in the king's courts. Another is the conufance of pleas, where a right is invested in the lord of the franchife to hold pleas; and he is the only perfon that can take advantage of it, by claiming his franchife. The third fort is an exempt jurifdiction, as where the king grants to fome city, that the inhabitants shall be fued within their city and not elsewhere : though there is no jurifdiction that can withftand a certiorari to the fuperior courts.

Ecclefiaftical JURISDICTION belongs to bishops and

their deputies.

Bishops, &c. have two kinds of jurisdiction; the one internal, which is exercifed over the confcience in things purely spiritual; and this they are supposed to hold immediately of God. The other is contentious, which is a privilege fome

princes have given them in terminating disputes be-

tween ecclefialtics and laymen.

JURISPRUDENCE, the science of what is just or unjust; or the knowlege of laws, rights, customs, flatutes, &c. necessary for the administration of justice. See LAW.

IUROR, JURATOR, in a legal fenfe, is one of those twenty four or twelve men who are fworn to deliver truth upon fuch evidence as shall be given them touching any matter in question. The punishment of petty jurors attainted of giving a verdict contrary to evidence, willingly, is very fevere.

JURY, a certain number of men fworn to enquire into and try a matter of fact, and to declare the truth upon fuch evidence as shall appear before them.

Turies are, in these kingdoms, the supreme judges in all courts and in all causes in which either the life, property, or reputation, of any man is concerned : this is the diftinguishing privilege of every Briton, and one of the most glorious advantages of our constitution : for as every one is tried by his peers, the meanest subject is as fafe and as free as the greatest. See the article TRIAL.

Yuar Mast, whatever is set up in room of a mast that has been loft in a florm or an engagement, and

JUS CORONE. See HEREDITART Right, and Suc-

Yos Deliberandi, in Scots law, that right which an fome derived from the French jouffe, of the Latin juxta, whether he will represent his predecessor.

Tus Devolutum, in Scots law, the right of the church, of prefenting a minister to a vacant parish, in case the patron shall neglect to use that right within the time

limited by law Jus Mariti. in Scots law, the right the husband acources to his wife's moveable effate, in virtue of the

Jus Relide, in Scots law, the right the wife has in the goods in communion, in case of the previous de-

ceale of the husband. Jus Preventionis, in Scots law, the preferable right of jurifdiction acquired by a court, in any cause to

which other courts are equally competent, by having exercised the first act of jurisdiction.

Jus Civile, amongst the Romans, fignified no more than the interpretation given by the learned, of the laws of the twelve tables, though the phrase now extends to the whole fyltem of the Roman laws.

Jus Civitatis, fignifies freedom of the city of Rome, which intitled those persons who had obtained it to most of the privileges of Roman citizens-yet it differs from Jus Quiritium, which extended to all the advantages which a free native of Rome was intitled tothe difference is much the fame as betwixt denization and naturalization with us.

Fus Honorarium, was a name given to those Roman laws which were made up of edicts of the supreme

magistrates, particularly the prators.

Tus Imaginis, was the right of using pictures and flatues amongst the Romans, and had some resemblance to the right of bearing a coat of arms amongst us. This honour was allowed to none but those whose anceltors or themselves had borne some curule office, that is, had been Curule Ædile, Cenfor, Pretor, or Conful.

The use of statues, &c. which the Jus Imaginis gave, was the exhibiting them in funeral processions, &c.

See INAGE.

Jus Papirianum, was the laws of Romulus, Numa, and other kings of Rome, collected into a body by Sextus Papirius, who lived in the time of Tarquin the

Proud, which accounts for the name.

Jus Trium Liberorum was a privilege granted to fuch persons in the city of Rome as had three children, by which they were exempted from all troublefome offices. The same exemption was granted to any perfons who lived in other parts of Italy, having four children; and those that lived in the provinces, provided they had five (or as fome fay feven) children, were intitled to the fame immunities. This was good policy, and tended to the population of the empire. For a further account of these privileges, See CHIL-

JUSSICA, in botany: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 17th order, Calycanthema. The calyx is quadripartite or quinquepartite superior; there are four or five petals; the capfule quadrilocular or quinquelocular, oblong, opening at the angles; the feeds are numerous and small.

JUST, a sportive kind of combat on horseback, man against man, armed with lances. The word is by

heir has by law of deliberating for a certain time because the combatants fought near one another. Salmafius derives it from the modern Greek zouffra, or rather There, which is used in this sense by Nicephorus Gregorius. Others derive it from julia, which in the corrupt age of the Latin tongue was used for this exercise, by reason it was supposed a more just and equal combat than the tournament.

> The difference between justs and tournaments confifts in this, that the latter is the genus, of which the former is only a species. Tournaments included all kinds of military fports and engagements made out of gallantry and diversion : Justs were those particular combats where the parties were near each other, and engaged with lance and fword. Add, that the tournament was frequently performed by a number of cavaliers, who fought in a body: The just was a fingle combat of one man against another .- Though the justs were usually made in tournaments after a general rencounter of all the cavaliers, yet they were fometimes fingly, and independent of any tournament. See Tour-NAMENT.

He who appeared for the first time at a just, forfeited his helm or casque unless he had forfeited before at

a tournament.

JUSTEL (Christopher), a learned counfellor, and fecretary to the French king, was born at Paris in 1580, and applied bimfelf to the fludy of ecclefiaftical history. He maintained a correspondence with the most learned men of his time, as archbishop Usher, Sir Henry Spelmen, Blondel, &c. till his death, which happened in 1649. He wrote, I. The code of the canons of the church universal, and the councils of Africa, with notes. 2. A genealogical history of the house of Auvergne. And, 3. Collections of Greek and Latin canons, from feveral manufcripts, which formed the Bibliotheca juris canonici veteris, published in 2 vols folio, by William Voet and our author's

JUSTEL (Henry), fon of the foregoing, was born at Paris in 1620. He became fecretary and counfellor to the king ; and was as diftinguished for his own learning as remarkable for encouraging it in others. He came to London in 1681, on the perfecution of the Protestants; and was made keeper of the royal library at St James's: which office he held till his death in 1603, when he was succeeded by the famous Dr Bentley. He wrote feveral books, the titles of which may be feen in the catalogue of the Bodleian library.

JUSTICE, in a moral fense, is one of the four cardinal virtues, which gives every person his due.

Civilians diftinguish justice into two kinds; communicative and distributive. The former establishes fair dealing in the mutual commerce between man and man; and includes fincerity in our discourse, and integrity in our dealings. The effect of fincerity is mutual confidence, so necessary among the members of the same community; and this mutual confidence is fullained and preferved by the integrity of our conduct.

Distributive justice is that by which the differences of mankind are decided, according to the rules of equity. The former is the justice of private individuals ;

the latter of princes and magistrates.

Fidelity and truth are the foundation of justice. As

ture, to be fo to the utmost of our ability is the glory

The following examples of this virtue are extracted from various authors.

1. Among the feveral virtues of Ariffides, that for which he was most renowned was justice; because this virtue is of most general use, its benefits extending to a greater number of persons, as it is the foundation, and in a manner the foul, of every public office and employment. Hence it was that Aritides, though in low circumstances, and of mean extraction, obtained the glorious furname of the Fuft; a title, fays Plutarch, truly royal, or rather truly divine : but of which princes are feldom ambitious, because generally ignorant of its beauty and excellency. They choose rather to be called the conquerors of cities and the thunderbolts of war, preferring the vain honour of pompous titles, which convey no other idea than violence and flaughter, to the folid glory of those expreffive of goodness and virtue. How much Aristides de. ferved the title given him, will appear in the following instances; though it ought to be observed, that he acquired it not by one or two particular actions, but by the whole tener of his conduct.

Themistocles having conceived the design of supplanting the Lacedemonians, and of taking the government of Greece out of their hands, in order to put it into those of the Athenians, kept his eye and his thoughts continually fixed upon that great project; and as he was not very nice or scrupulous in the choice of his measures, whatever tended towards the accomplishing of the end he had in view he looked upon as

fuft and lawful.

On a certain day then he declared in a full affembly of the people, that he had a very important defign to propose; but that he could not communicate it to the people, because its success required it should be carried on with the greatest secrecy : he therefore defired they would appoint a person to whom he might explain himself upon the matter in question. Aristides was unanimoufly fixed upon by the whole affembly, who referred themselves entirely to his opinion of the affair; fo great a confidence had they both in his probity and prudence. Themistocles, therefore, having taken him aside, told him that the design he had conceived was to burn the fleet belonging to the rest of the Grecian flates, which then lay in a neighbouring port; and by this means Athens would certainly become mistress of all Greece. Ariftides hereupon returned to the affembly, and only declared to them that indeed nothing could be more advantageous to the commonwealth than Themistocles's project, but that at the same time nothing in the world could be more unjust. All the people unanimously ordained that Themistocles should entirely defift from his project.

There is not perhaps in all history a fact more worthy of admiration than this. It is not a company of philosophers (to whom it costs nothing to establish fine maxims and fublime notions of morality in the school) who determine on this occasion that the consideration of profit and advantage ought never to prevail in preference to what is honest and just; but the whole people who are highly interested in the proposal made to Nº 171.

Juftice. to be perfectly just is an attribute of the Divine Na- them, that are convinced it is of the greatest import- Justice. ance to the welfare of the state, and who, however, reject it with unanimous confent, and without a moment's hefitation; and for this only reason, that it is contrary to justice. How black and perfidious, on the other hand, was the defign which Themistocles proposed to them, of burning the fleet of their Grecian confederates at a time of entire peace, folely to aggrandize the power of the Athenians! Had he an hundred times the merit ascribed to him, this fingle action would be fufficient to fully all his glory; for it is the heart, that is to fay, integrity and probity, which conflitutes and diftinguishes true merit.

2. The government of Greece having paffed from

Sparta to the Athenians, it was thought proper under this new government to lodge in the island of Delos the common treasure of Greece; to fix new regulations with regard to the public money; and to lay fuch a tax as might be regulated according to the revenue of each city and state, in order that the expences being equally borne by the feveral individuals who composed the body of the allies, no one might have reason to murmur. The difficulty was to find a person of so honest and incorrupt a mind, as to discharge faithfully an employment of fo delicate and dangerous a kind, the due administration of which for nearly concerned the public welfare. All the allies cast their eyes on Aristides; accordingly they invested him with full powers, and appointed him to levy a tax on each of them, relying entirely on his wifdom and justice. The citizens had no cause to repent their choice. He presided over the treasury with the sidelity and difinterestedness of a man who looks upon it as a capital crime to embezzle the smallest portion of another's possessions, with the care and activity of a father of a family in the management of his own estate, and with the caution and integrity of a person who confiders the public moneys as facred. In fine, he fucceeded in what is equally difficult and extraordinary, viz to acquire the love of all in an office in which he who escapes the public odium gains a great point. Such is the glorious character which Seneca gives of a person charged with an employment of almost the same kind, and the noblest eulogium that can be given to fuch as administer public revenues. It is the exact picture of Aritides. He discovered so much probity and wisdom in the exercise of this office, that no man complained; and those times were considered ever after as the golden age; that is, the period in which Greece had attained its highest pitch of virtue and happiness.

While he was treasurer general of the republic, he made it appear that his predecessors in that office had cheated the state of vast sums of money, and among the rest Themistocles in particular; for this great man, with all his merit, was not irreproachable on that head; for which reason, when Aristides came to pass his account, Themistocles raised a mighty faction against him, accused him of having embezzled the public treasure, and prevailed so far as to have him condemned and fined. But the principal inhabitants, and the most virtuous part of the citizens, rising up against so unjust a sentence, not only the judgment was reversed and the fine remitted, but he was elected treasurer a-

gain for the year enfuing. He then feemed to repent of his former administration; and by showing himself more tractable and indulgent towards others, he found out the fecret of pleafing all that plundered the commonwealth: for as he neither reproved them nor narrowly inspected their accounts, all these plunderers, grown fat with spoil and rapine, now extolled Aristides to the skies. It would have been easy for him, as we perceive, to have enriched himself in a post of that nature, which feems, as it were, to invite a man to it by the many favourable opportunities it lays in his way; especially as he had to do with officers, who for their part were intent upon nothing but robbing the public, and would have been ready to conceal the frauds of the treasurer their mafter upon condition he did them the same favour. These very officers now made interest with the people to have him continued a third year in the fame employment : but when the time of election was come, just as they were will: but it is not possible that we should become hapon the point of electing Ariftides unanimoufly, he rofe up, and warmly reproved the Athenian people: "What (fays he), when I managed your treasure with all the fidelity and diligence an honest man is capable of, I met with the most cruel treatment, and the most mortifying returns; and now that I have abandoned it to the mercy of these robbers of the republic, I am an admirable man and the best of citizens! I cannot help declaring to you, that I am more ashamed of the honour you do me this day, than I was of the condemnation you passed against me this time twelvemonth; and with grief I find that it is more glorious with us to be complaifant to knaves than to fave the treasures of the republic." By this declaration he filenced the public plunderers and gained the efteem of all good men.

3. In the Universal History we meet with the following remarkable inflance of a fcrupulous regard to justice in a Persian king named Nouschirvan. Having been out a-hunting, and defirous of eating some of the venison in the field, several of his attendants went to a neighbouring village and took away a quantity of falt to feafon it. The king fuspecting how they had acted, ordered that they should immediately go and pay for it. Then turning to his attendants, he faid, "This is a fmall matter in itself, but a great one as it regards me : for a king ought ever to be just, because he is an example to his fubjects; and if he fwerves in trifles, they will become diffolute. If I cannot make all my people just in the smallest things, I can at least show them it is possible to be fo."

These examples, to which many more might be added, are highly pleafing to a fagacious and virtuous mind; but the fenfual and brutal part of mankind, who regard only the prefent moment, who fee no obalways ready to defert it when it exposes them to any and without expence to the parties. danger or threatens them with any lofs. From this 4. Ariftides being judge between two private per-

Vol. IX. Part II.

disposition of mind proceeds that avidity of wealth Justices and that habitual fraud which perpetually embroil civil fociety: from this fatal fource arifes that deluge of iniquity which has overflowed the world; from this preference of interest to honesty proceed every unjust litigation and every act of violence. And yet nothing is more certain than that " Whatever is unjust must, upon the whole, be difadvantageous;" which might be proved thus:

Nothing is advantageous or ufeful but that which has a tendency to render us happy: the highest advantage, or absolute utility, is complete happiness; and to this happiness, whatever is advantageous or useful is relative as to an ultimate end; and nothing that is not thus relative to happiness can properly be said to be advantageous or useful. But whatever is unjust, fo far from tending to promote, that it destroys our happiness; for whatever is unjust is contrary to the Divine py by refifting that will; because of this will our happiness is the immediate object. God is not a tyrant, proud of incontroulable power, who impofes capricious laws only as telts of our obedience, and to make us feel the weight of his yoke; all his precepts are lessons which teach us how to be happy. But it is the will of God that we should be just; from whence it sollows, that no true happiness can be acquired by those who are unjust. An action, therefore, which is contrary to the will of God, must be inconsistent with our true interest; and confequently, fo far from being useful or expedient, it must inevitably produce ruin and mifery. Injustice fometimes meets with the punishment it deserves in this world; but if it should escape here, it does not follow that it will for ever escape. It proves, on the contrary, that there is another world in which the fates of mankind will be impartially decided.

But to prevent the dreadful confusion which the mistaken notion of interest had introduced among mankind, it became necessary to have recourse to the innate principles of justice; to suspend the balance and display the sword, for the determination of differences and the punishment of guilt. This is the reason and origin of distributive justice, which became the necesfary appendage of fovereignty. Accordingly in ancient times, princes administered justice in person and without delay; but at length being embarraffed and oppressed by the multiplicity of business which increafed with their dominions, or diverted from their attention to civil government by the command of armies, certain laws were established with great folemnity to adjust and determine the differences which might arife among the members of the fame community, and to reprefs the infolence of those who dared to violate jects but those which fall under the cognizance of the public peace, by possessing them with the dread corporeal eye, and estimate the merit of every action either of corporeal punishment or infamy. The exeby the gain which it produces, have always confidered cution of these laws was put into the hands of suborjustice and utility as independent of each other. They dinate judges. These delegates of the sovereign power put utility in the balance against honesty every day; were called magistrates; and these are the persons by and never fail to incline the beam in favour of the for- whom justice is at this time administered, except in mer, if the supposed advantage is thought to be con- particular cases, in which the sovereign himself intersiderable. They have no regard to justice but as they feres. But by whomsoever this kind of justice is adseckon to gain by it, or at least not to lose; and are ministered, it ought to be done specially, impartially,

Justice. fons, one of them declared, that his adversary had one of those brutal minds which can be gratified with Justice. greatly injured Aristides. "Relate rather, good the violation of innocence and beauty, without the friend (faid he, interrupting him), what wrong he least pity, passion, or love for that with which they are fo much delighted.

hath done thee; for it is thy cause, not mine, that I now fit judge of."-Again: Being defired by Simonides, a poet of Chios, who had a cause to try before him, to ftretch a point in his favour, he replied, " As you would not be a good poet if your lines ran contrary to the just measures and rules of your art; fo I should neither be a good judge nor an honest man if I decided aught in opposition to law and justice." 5. Artabarzanes, an officer of Artaxerxes king of

Perfia, begged his majefty to confer a favour upon him; which if complied with would be an act of injustice. The king being informed that the promife of a confiderable fum of money was the only motive that induced the officer to make fo unreasonable a request, ordered his treasurer to give him thirty thousand dariufes, being a prefent of equal value with that which he was to have received. Giving him the order for the money, " Here, take (fays the king) this token of my friendship for you: a gift of this nature cannot make me poor; but complying with your request would make me poor indeed, for it would make

me unjust."

6. Cambyses king of Persia was remarkable for the feverity of his government and his inexorable regard to justice. This prince had a particular favourite whom he made a judge; and this judge reckoned himself fo fecure in the credit he had with his malter, that without any more ado causes were bought and fold in the courts of judicature as openly as provisions in the market. But when Cambyfes was informed of these proceedings, enraged to find his friendship so ungratefully abused, the honour of his government profituted, and the liberty and property of his fubjects facrificed to the avarice of his wretched minion, he ordered him to be feized and publicly degraded; after which he commanded his skin to be stripped over his ears, and the feat of judgment to be covered with it as a warning to others. At the fame time, to convince the world that this feverity proceeded only from the love of juffice, he permitted the fon to fucceed his father in the honours and office of prime minister.

7. When Charles duke of Burgundy, furnamed the Bold, reigned over spacious dominions, now fwallowed up by the power of France, he heaped many favours and honours upon Claudius Rynfault, a German, who had ferved him in his wars against the infults of his neighbours. The prince himself was a person of singular humanity and justice; and being prepoffessed in favour of Rynsault, upon the decease of the governor of the chief town of Zealand gave him that command. He was not long feated on that government before he cast his eyes upon Sapphira, a woman of exquisite beauty, the wife of Paul Danvelt, a wealthy merchant of the city, under his protection and government. Rynfault was a man of a warm constitution, and violent inclination to women. He knew what it was to enjoy the fatisfactions which are reaped from the poffession of beauty; but was an utter stranger to the decencies, honours, and delicacies, that attend the passion toward them in elegant minds. He could with his tongue utter a passion with which

Rynfault being refolved to accomplish his will on the wife of Danvelt, left no aits untried to get into a familiarity at her house; but she knew his character and difposition too well not to shun all occasions that might enfnare her into his conversation. The governor, despairing of success by ordinary means, apprehended and imprisoned her husband, under pretence of an information that he was guilty of a correspondence with the enemies of the duke to betray the town into their poffession. This design had its desired effect; and the wife of the unfortunate Danvelt, the day before that which was appointed for his execution, prefented herfelf in the hall of the governor's house, and as he paffed through the apartment threw herfelf at his feet, and holding his knees, befeeched his mercy. Rynfault beheld her with a diffembled fatisfaction; and affuming an air of thought and anthority, he bid her rife, and told her she must follow him to his clofet; and asking her whether she knew the hand of the letter he pulled out of his pocket? went from her, leaving this admonition aloud: " If you would fave your hufband, you must give me an account of all you know, without prevarication; for every body is fatisfied that he is too fond of you to be able to hide from you the names of the rest of the conspirators, or any other particulars whatfoever." He went to his closet, and foon after the lady was fent for to an audience. The fervant knew his distance when matters of flate were to be debated; and the governor. laving afide the air with which he had appeared in public, began to be the fupplicant, and to rally an affliction which it was in her power eafily to remove. She eafily perceived his intention; and, bathed in tears, began to deprecate fo wicked a defign. Luft, like ambition, takes all the faculties of the mind and body into its fervice and fubjection. Her becoming tears her honest anguish, the wringing of her hands, and the many changes of her pollure and figure in the vehemence of fpeaking, were but fo many attitudes in which he beheld her beauty, and farther incentives of his defire. All humanity was loft in that one appetite; and he fignified to her in fo many plain terms, that he was unhappy till he possessed her, and nothing less should be the price of her husband's life; and she must, before the following noon, pronounce the death or enlargement of Danvelt. After this notification, when he faw Sapphira enough diffracted to make the fubject of their discourse to common eyes appear different from what it was, he called his fervants to conduct her to the gate. Loaded with insupportable affliction, the immediately repairs to her husband, and having fignified to the gaolers that she had a propofal to make to her husband from the governor, the was left alone with him, revealed to him all that had paffed, and reprefented the endless conflict fhe was in between love to his perfon and fidelity to his bed. It is easy to imagine the sharp affliction this honest pair was in upon fuch an incident, in lives not used to any but ordinary occurrences. The man was bridled by shame from speaking what his fear his heart was wholly untouched. In short, he was prompted upon fo near an approach of death; but let

Inflice. fall words that fignified to her, he should not think character, a regard to justice was not the least. Of Justice. her polluted, though she had not confessed to him that the governor had violated her person, since he knew her will had no part in the action. She parted from him with this oblique permission, to save a life he had not resolution enough to relign for the safety of his honour.

The next morning the unhappy Sapphira attended the governor, and being led into a remote apartment, fubmitted to his defires. Rynfault commended her charms; claimed a familiarity after what had paffed between them; and with an air of gaiety, in the language of a gallant, bid her return and take her husband out of prison: but, continued he, my fair one must not be offended that I have taken care he should not be an interruption to our future affignations. These last words foreboded what she found when she came to the gaol, her husband executed by the order

It was remarkable, that the woman, who was full of tears and lamentations during the whole course of her affliction, uttered neither figh nor complaint, but stood fixed with grief at this confummation of her misfortunes. She betook herfelf to her abode; and, after having in folitude paid her devotions to Him who is the avenger of innocence, fhe repaired privately to court. Her person, and a certain grandeur of sorrow negligent of forms, gained her passage into the presence of the duke her fovereign. As foon as she came into the presence, she broke forth into the following words: "Behold, O mighty Charles, a wretch weary of life, though it has always been fpent with innocence and virtue. It is not in your power to redrefs my injuries, but it is to avenge them; and if the protection of the distressed, and the punishment of oppressors, is a task worthy of a prince, I bring the duke of Burgundy ample matter for doing honour to his own great name, and of wiping infamy off mine." When the had spoken this, she delivered to the duke a paper reciting her flory. He read it with all the emotion that indignation and pity could raife in a prince jealous of his honour in the behaviour of his officers and the prosperity

Upon an appointed day Rynfault was fent for to court, and in the presence of a sew of the council confronted by Sapphira. The prince asking, "Do you know that lady?" Rynfault, as foon as he could recover his furprife, told the duke he would marry her, if his highness would please to think that a repadiate execution of Rynfault.

8. One of the greatest of the Turkish princes was

this the following example is related by Mr Gibbon in his Decline and Fall of the Roman Empire .- As he fat in the divan, an unhappy subject bowed before the throne to accuse the insolence of a Turkish soldier who had driven him from his house and bed. " Suspend your clamours (faid Mahmud); inform me of his next vifit, and ourfelf in person will judge and punish the offender." The fultan followed his guide; invested the house with his guards; and extinguishing the torches, pronounced the death of the criminal, who had been feized in the act of rapine and adultery. After the execution of his fentence, the lights were rekindled, and Mahmud fell proftrate in prayer; then rifing from the ground, he demanded fome homely fare, which he devoured with the voraciousness of hunger. The poor man, whose injury he had avenged, was unable to suppress his aftonishment and curiofity; and the courteous monarch condescended to explain the motives of this fingular behaviour. " I had reason to fuspect that none except one of my fons could dare to perpetrate fuch an outrage; and I extinguished the lights, that my justice might be blind and inexorable. My prayer was a thankfgiving on the difcovery of the offender; and fo painful was my anxiety, that I had paffed three days without food fince the first moment of your complaint."

9. In Bourgoane's Travels in Spain, vol. iii. the following anecdote is given of Peter III. of Castile. A canon of the cathedral of Seville, affected in his drefs, and particularly in his shoes, could not find a workman to his liking. An unfortunate shoemaker, to whom he applied after quitting many others, having brought him a pair of shoes not made to please his tafte, the canon became furious, and feizing one of the tools of the shoemaker, gave him with it so many blows upon the head as laid him dead upon the floor. The unhappy man left a widow, four daughters, and a fon 14 years of age, the eldelt of the indigent family. They made their complaints to the chapter : the canon was profecuted and condemned not to appear in the choir for a year. The young shoemaker having attained to man's effate, was scarcely able to get a livelihood; and overwhelmed with wretchedness, fat down on the day of a procession at the door of the cathedral of Seville in the moment the procellion paffed by. Amongst the other canons he perceived the murderer of his father. At the fight of this man, filial affection, rage, and despair, got so far the better of ration. The duke feemed contented with this au- his reason, that he fell furiously upon the priest, and fwer, and flood by during the immediate folemniza- flabbed him to the heart. The young man was feized, tion of the ceremony. At the conclusion of it he convicted of the crime, and immediately condemned told Rynfault, "Thus far you have done as conftrain- to be quartered alive. Peter, whom we call the Cruel, ed by my authority: I shall not be satisfied of your and whom the Spaniards, with more reason, call the kind utage of her, without you fign a gift of your lover of juffice, was then at Seville. The affair came to whole effate to her after your deceale." To the per- his knowledge; and after learning the particulars, he formance of this also the duke was a witness. When determined to be himself the judge of the young shoethefe two acts were executed, the duke turning to maker. When he proceeded to give judgment, he the lady, told her, "It now remains for me to put first annulled the sentence just pronounced by the clergy; you in quiet pofferfion of what your husband has fo and after asking the young man what profession he bountifully bellowed on you;" and ordered the imme- was, "I forbid you (faid he) to make shoes for a year to come."

10. In Gladwin's History of Indostan, a singular Mamood, or Mahmud, the Gaznevide. His name is fact is related of the emperor Jehangir, under whose still venerable in the east; and of the noble parts of his father Akber the Mogul empire in Hindostan first ob-

was made of pure gold, and measured 30 yards, con- advantage of the subject. fifting of 60 links, weighing four maunds of Hindoftan (about 400 pounds avoirdupois). One end of the he is also called juffice in eyre of the forest. chain was fufpended from the royal baftion of the fortress of Agra, and the other fastened in the ground near the fide of the river. The intention of this extraordinary invention was, that if the officers of the courts of law were partial in their decifions, or dilatory in the administration of justice, the injured parties might come themselves to this chain; and making a noise by shaking the links of it, give notice that they were waiting to represent their grievauces to his maiestv."

JUSTICE is also an appellation given to a person deputed by the king to administer justice to his subjects, whose authority arises from his deputation, and not

by right of magistracy.

Of these justices there are various kinds in England; of general gaol-delivery is held eight times in the year.

tice of Great Britain, and is a lord by his office. His business is chiefly to hear and determine all pleas of the crown; that is, fuch as concern offences against the crown, dignity, and peace of the king; as treafons, felonies, &c. This officer was formerly not only chief justice, but also chief baron for the exchequer, and maller of the court of wards. He usually fat in the king's palace, and there executed that office, formerly performed per comitem palatii; he determined in that place all the differences happening between the barons and other great men. He had the prerogative of being viceregent of the kingdom whenever the king went beyond sea, and was usually chosen to that office out of the prime nobility; but his power was reoffice is now divided, and his title changed from capitalis Anglia justitiarius, to capitalis justitiarius ad placita, coram rege tenenda, or capitalis justitiarius banci regii.

JUSTICE of the Common Pleas, he who with his affiftants hears and determines all causes at the com- day; though for authority and manner of proceeding mon law; that is to fay, all civil causes between common persons, as well personal as real; and he is also a

lord by his office.

Fustice of the Forest, is a lord by his office, who has power and authority to determine offences committed in the king's forests, &c. which are not to be determined by any other court of justice. Of these there refts on this fide Trent, and the other beyond it.

By many ancient records, it appears to be a place of great honour and authority, and is never bestowed but on fome person of great distinction. The court where this justice fits is called the justice feat of the forest. held once every three years, for hearing and determining all trespasses within the forest, and all claims

tained any regular form. Jehangir succeeded him at of Charles I. before the earl of Holland. After the Justice. Agra on the 22d of October 1605; and the first or- restoration another was held for form fake before the der which he iffued on his accession to the throne was earl of Oxford; but fince the revolution in 1688, the for the construction of the golden chain of justice. It forest laws have fallen into total difuse, to the great

This is the only justice who may appoint a deputy :

JUSTICES of Affife, were fuch as were wont by special commission to be sent into this or that county to take affifes, for the eafe of the fubjects: For, whereas these actions pass always by jury, so many men might not without great damage and charge be brought up to London; and therefore justices, for this purpole, by commissions particularly authorised, were fent down to them. These continue to pass the circuit by two and two twice every year through all England, except the four northern counties, where they go only once, dispatching their several businesses by feveral commissions; for they have one commission to take affifes, another to deliver gaols, and another of oyer and terminer. In London and Middlefex a court

All the juftices of peace of any county wherein the Chief Fustice of the King's Bench, is the capital juf. affifes are held, are bound by law to attend them, or elfe are liable to a fine; in order to return recognizances, &c. and to affift the judges in fuch matters as lie within their knowledge and jurisdiction, and in which some of them have been probably concerned, by way of previous examination. See Assisss and

TURY.

FUSTICES in Eyre (juliciarii itinerantes, or errantes). were those who were anciently sent with commission into divers counties to hear fuch causes especially as were termed pleas of the crown; and that for the eate of the subject, who must else have been hurried to the courts of Westminster, if the cause were too high for the county-courts.

According to fome, these justices were fent once in duced by king Richard I. and king Edward I. His feven years; but others will have them to have been fent oftener. Camden fays, they were inflituted in the reign of king Henry II. A. D. 1184; but they appear to be of an older date.

They were somewhat like our justices of affise at this

very different.

FOSTICES of Gaol Delivery, those commissioned to hear and determine causes appertaining to such as for any offence are cast into prison. Justices of gaol-delivery are impowered by the common law to proceed upon indictments of felony, trespals, &c. and to order execution or reprieve; and they have power to difare two; whereof one has jurifdiction over all the fo- charge fuch prisoners as upon their trials shall be acquitted; also all such against whom, on proclamation made, no evidence appears to indict; which justices of over and terminer, &c. may not do. 2. Hawk. 24, 25. But these justices have nothing to do with any person not in the cultody of the prison except in some special cases; as if some of the accomplices to a felony may be in fuch prison and some of them out of of franchifes, liberties, and privileges, and all pleas and it, the justices may receive an appeal against those who eauses whatsoever therein arising. This court may fine are out of the prison as well as those who are in it : and imprison for offences within the forest, it being a which appeal, after the trial of such prisoners, shall be court of record; and therefore a writ of error lies from removed into B. R. and process iffue from them against hence to the court of king's bench. The last court the rest. But if those out of prison be omitted in the of juffice feat of any note was that held in the reign appeal, they can never be put into any other; because there

is now turned over to the jullices of affife.

JUSTICES of Nisi Prius are now the same with justices of affile. It is a common adjournment of a cause in the common pleas to put it off to fuch a day, Nifi prius justitarii venerint ad eas partes ad capiendas affisas : from which clause of adjournment they are called juffices of nisi prius, as well as justices of assis, on account of the

writ and actions they have to deal in. Fustices of Over and Terminer, were justices deputed on fome special occasions to hear and determine particular causes .- The commission of over and terminer is directed to certain persons upon any infurrection, heinous demeanour, or trespass committed, who must first enquire, by means of the grand jury or inquest, before they are empowered to hear and determine by the help of the petit jury. It was formerly held, that no judge or other lawyer could act in the commission of over and terminer, or in that of gaol-delivery, within the county where he was born or inhabited; but it was thought proper by 12 Geo. II. cap, 27. to allow

any man to be a justice of over and terminer and general gaol-delivery within any county of England. Justices of the Peace are persons of interest and credit, appointed by the king's commission to keep the

peace of the county where they live.

Of these some for special respect are made of the quorum, fo as no business of importance may be difpatched without the prefence or affent of them or one of them. However, every justice of peace hath a feparate power, and his office is to call before him, examine, iffue warrants for apprehending, and commit to prison, all thieves, murderers, wandering rogues; those that hold conspiracies, riots, and almost all delinquents which may occasion the breach of the peace and quiet of the subject; to commit to prison such as cannot find bail, and to fee them brought forth in due time to trial; and bind over the profecutors to the affifes. And if they neglect to certify examinations and informations to the next gaol-delivery, or do not bind over profecutors, they shall be fined. A justice may commit a person that doth a selony in his own view, without warrant; but if on the information of another, he must make a warrant under hand and seal for that purpofe. If complaint and oath be made before a justice of goods stolen, and the informer, suspecting that they are in a particular house, shows the cause of

Tuftice. there can be but one appeal for one felony. In this rity for keeping the peace in the king's bench or chan- Juffice. way the gaols are cleared, and all offenders tried, pu- cery, may have a fuperfedeas to the justices in the counnished, or delivered, in every year .- Their commission ty not to take security; and also by giving surety of the peace to any other justice. If one make an affault upon a justice of peace, he may apprehend the offender, and commit him to gaol till be finds furcties for the peace; and a juffice may record a forcible entry on his own poffession: in other cases be cannot judge in his own caufe. Contempts against justices are punishable by indictment and fine at the feftious. Initices shall not be regularly punished for any thing done by them in fessions as judges; and if a justice be tried for any thing done in his office, he may plead the general iffue, and give the special matter in evidence; and if a verdict is given for him, or the plaintiff be nonfuit, he shall have double costs; and such action shall only be laid in the county where the offence was committed. 7. Jac. cap. 5. 21 Jac. cap. 12. But if they are guilty of any misdemeanour in office, information lies against them in the king's bench, where they shall be punished by fine and imprisonment; and all persons who recover a verdict against a justice for any wilful or malicious injury, are intitled to double costs. By 24 Geo. II. cap. 44. no writ shall be fued out against any justice of peace, for any thing done by him in the execution of his office, until notice in writing shall be delivered to him one month before the fuing out of the same, containing the cause of action. &c. within which month he may tender amends; and if the tender be found fufficient, he shall have a verdict-&c. Nor shall any action be brought against a justice for any thing done in the execution of his office. unless commenced within fix months after the act committed.

A justice is to exercise his authority only within the county where he is appointed by his commission, not in any city which is a county of itself or town corporate, having their proper justices, &c. but in other towns and liberties he may. The power and office of juffices terminate in fix months after the demife of the crown, by an express writ of discharge under the great feal, by writ of fupersedeas, by a new commission, and by accession of the office of theriff or coroner.

The original of juttices of the peace is referred to the fourth year of Edward III. They were first called confervators, or wardens of the peace, elected by the county, upon a writ directed to the fheriff; but the power of appointing them was transferred by flatutes from the people to the king; and under this appellahis suspicion, the justice may grant a warrant to the tion appointed by I Edw. III cap: 16. Asterwards constable, &c. to search in the place suspected, to the statute 34 Edw. III. cap. I. gave them the power feize the goods and person in whose cuttody they are of trying felonies, and then they acquired the appellafound, and bring them before him or some other just tion of justices. They are appointed by the king's tice. The fearch on these warrants ought to be in special commission under the great seal, the form of the day-time, and doors may be broke open by con- which was fettled by all the judges, A. D. 1590; and stables to take the goods. Justices of peace may make the king may appoint as many as he shall think fit in and perfuade an agreement in petty quarrels and every county in England and Wales, though they are breaches of the peace, where the king is not intitled to a generally made at the differention of the lord chancellor, fine, though they may not compound offences or take by the king's leave. At first the number of justices money for making agreements. A juffice hath a dif- was not above two or three in a county, 18 Edw. III. cretionary power of binding to the good behaviour; and cap. 2. Then it was provided by 34 Edw. III. cap. 1. may require a recognizance, with a great penalty of one, that one lord, and three or four of the most worthy for his keeping of the peace, where the party bound is men in the county, with some learned in the law, should a dangerous person, and likely to break the peace, be made justices in every county. The number was and do much mischief; and for default of sureties he afterwards restrained first to fix, and then to eight, in may be committed to gaol. But a man giving fecu- every county, by 12 Ric. II. cap. 10. and 14 Ric. II.

fustice. cap. 11. But their number has greatly increased fince crown itself cannot now alter but by act of parliament. Justice. their first institution. As to their qualifications, the flauntes just cited direct them to be of the best repu- pendence of the judges in the superior courts, it is entation and most worthy men in the county; and the acted by the statute 13 W. III. c. 2. that their comflatute 13 Ric. II. cap. 7. orders them to be of the most sufficient knights, esquires, and gentlemen of the law; and by 2 Hen. V. stat. 1. cap. 4. and stat. 2. cap, 1, they must be resident in their several counties. And by 18 Hen. VI. cap. 11. no justice was to be put in commission, if he had not lands to the value of 201. per annum. It is now enacted by 5 Geo. II. cap. 11. that every justice shall have 100 l. per annum, clear of all deductions; of which he must make oath by 18 Geo. II. cap. 20. And if he acts without fuch qualification, he shall forfeit 100 l. It is also provided by 5 Geo. II. that no practifing attorney, folicitor, or proctor, shall be capable of acting as a justice of the

FUSTICES of Peace within Liberties, are justices of the peace who have the fame authority in cities or other corporate towns as the others have in counties; and their power is the fame; only that these have the affize of ale and beer, wood and victuals, &c. Justices of cities and corporations are not within the qualification act, 5 Geo. II. cap. 18.

Fountain of Justice, one of the characters or attri-

butes of the king. See PREROGATIVE.

By the fountain of justice the law does not mean the author or original, but only the distributor. Justice is not derived from the king, as from his free gift; but he is the fleward of the public, to difpense it to whom it is due. He is not the fpring, but the refervoir; from whence right and equity are conducted, by a thousand channels, to every individual. The original power of judicature, by the fundamental principles of fociety, is lodged in the fociety at large: but as it would be impracticable to render complete justice to every individual, by the people in their collective capacity, therefore every nation has committed that power to certain felect magistrates, who with more eafe and expedition can hear and determine complaints; and in England this authority has immemorially been exercifed by the king or his fubflitutes. He therefore has alone the right of erecting courts of judicature: for though the constitution of the kingdom hath entrufted him with the whole executive power of the laws, it is impossible, as well as improper, that he should personally carry into execution this great and extensive trult : it is consequently necessary that courts should be erected, to affift him in executing this power; and equally necessary, that, if erected, they should be erected by his authority. And hence it is, that all jurisdictions of courts are either mediately or immediately derived from the crown, their proceedings run generally in the king's name, they pass under his feal, and are executed by his officers.

It is probable, and almost certain, that in very early times, before our constitution arrived at its full per-

And in order to maintain both the dignity and indemissions shall be made (not, as formerly, durante beneplacito, but) quamdiu bene se gesserint, and their salaries afcertained and established; but that it may be lawful to remove them on the address of both houses of parliament. And now, by the noble improvements of that law in the statute of I Geo. III. c. 23. enacted at the earnest recommendation of the king himself from the throne, the judges are continued in their offices during their good behaviour, notwithstanding any demife of the crown (which was formerly held immediately to vacate their feats), and their full falaries are absolutely secured to them during the continuance of their commissions; his majesty having been pleased to declare, that " he looked upon the independence and uprightness of the judges, as effential to the impartial administration of justice; as one of the best securities of the rights and liberties of his fubjects; and as most conducive to the honour of the crown."

In criminal proceedings or profecutions for offences, it would ftill be a higher abfurdity, if the king perfonally fat in judgment; because in regard to these he appears in another capacity, that of profecutor. All offences are either against the king's peace or his crown and dignity; and are fo laid in every indictment. For though in their confequences they generally feem (except in the case of treason and a very few others) to be rather offences against the kingdom than the king; yet, as the public, which is an invisible body, has delegated all its power and rights, with regard to the execution of the laws, to one visible magistrate, all affronts to that power, and breaches of those rights, arc immediately offences against him, to whom they are fo delegated by the public. He is therefore the proper person to prosecute for all public offences and breaches of the peace, being the person injured in the eve of the law. And this notion was carried fo far in the old Gothic constitution (wherein the king was bound by his coronation oath to conferve the peace), that in case of any forcible injury offered to the person of a fellow-subject, the offender was accused of a kind of perjury, in having violated the king's coronation oath; dicebatur fregisse juramentum regis juratum. And hence also arises another branch of the prerogative, that of pardoning offences; for it is reasonable, that he only who is injured should have the power of forgiving. See PARDON.

In this diffinct and separate existence of the judicial power, in a peculiar body of men, nominated indeed, but not removeable at pleafure, by the crown, confifts one main prefervative of the public liberty; which cannot fubfift long in any state, unless the administration of common justice be in some degree separated both from the legislative and also from the executive power. Were it joined with the legislative, the life, fection, our kings in person often heard and deter- liberty, and property, of the subject would be in the mined causes between party and party. But at pre- hands of arbitrary judges, whole decisions would be fent, by the long and uniform usage of many ages, then regulated only by their own opinions, and not our kings have delegated their whole judicial power to by any fundamental principles of law; which, though the judges of their feveral courts; which are the grand legislators may depart from, yet judges are bound to depository of the fundamental laws of the kingdom, observe. Were it joined with the executive, this union and have gained a known and stated jurisdiction, re- might soon be an over-balance for the legislative. For gulated by certain and chablished rules, which the which reason, by the statute of 16 Car. I. c. 10. which

abolified the court of star-chamber, effectual care is layers and cuttings, and require the same treatment Justiciar taken to remove all judicial power out of the hands of with other tender exotics. the king's privy-council; who, as then was evident from recent inflances, might foon be inclined to pronounce that for law which was most agreeable to the prince or his officers. Nothing therefore is more to he avoided in a free conflictation, than uniting the provinces of a judge and a minister of state. And indeed, that the absolute power, claimed and exercised in a neighbouring nation, is more tolerable than that of the eaftern empires, is in a great measure owing to their having vefted the judicial power in their parliaments; a body separate and distinct from both the legislative and executive : and if ever that nation recovers its former liberty, it will owe it to the efforts of those af-femblies. In Turkey, where every thing is centered in the fultan or his ministers, despotic power is in its me-

A confequence of this prerogative is the legal ubiquity of the king. His majesty, in the eye of the law, is always prefent in all his courts, though he cannot personally distribute justice. His judges are the mirror by which the king's image is reflected. It is the regal office, and not the royal person, that is always prefent in court, always ready to undertake profecutions or pronounce judgment, for the benefit and protection of the subject. And from this ubiquity it follows, that the king can never be nonfuit; for a nonfuit is the defertion of the fuit or action by the nonappearance of the plaintive in court. For the fame reason also, in the forms of legal proceedings, the king is not faid to appear by his attorney, as other men do; for he always appears, in contemplation of

law, in his own proper perfon.

From the fame original, of the king's being the fountain of justice, we may also deduce the prerogative of iffuing proclamations, which is vested in the king alone. See PROCLAMATION.

TUSTICE-Seat. See FOREST Courts.

ridian, and wears a more dreadful aspect.

JUSTICIA, MALABAR-NUT: A genus of the monogynia order, belonging to the diandria class of plants; and in the natural method ranking under the 40th order, Personata. The corolla is ringent; the capfule bilocular, parting with an elastic spring at the heel; the stamina have only one anthera. There are 19 species, all of them natives of the East Indies, growing many feet high; fome adorned with fine large leaves, others with small narrow ones, and all of them with monopetalous ringent flowers. Only two fpecies are cultivated in our gardens, viz. the adhatoda or common Malabar-nut, and the hyffopifolia or fnap-tree. The first grows ten or twelve feet high, with a strong woody stem, branching out widely all around; having large, lanceolate, oval leaves, placed opposite; and from the ends of the branches thort forkes of white flowers, with dark fpots, having the helmet of the corolla concave. The fecond hath a shrubby stem branching from the bottom pyramidally three or four feet high; fpear-shaped, narrow,

JUSTICIAR, in the old Engish laws, an officer Justin. instituted by William the Conqueror, as the chief officer of state, who principally determined in all cases civil and criminal. He was called in Latin Capitalis Justiciarius totius Anglia. For JUSTICIAR in Scotland, See Law, no clvi, 10-12.

JUSTICIARY, or Court of JUSTICIARY, in Scotland.

See Law, no clvi. 10-12.

JUSTIFICATION, in law, fignifies a maintaining or showing a sufficient reason in court why the defendant did what he is called to answer. Pleas in justification mult fet forth fome special matter: thus, on being fued for a trespass, a person may justify it by proving, that the land is his own freehold; that he entered a house in order to appreliend a felon; or by virtue of a warrant, to levy a forfeiture, or in order to take a diffres; and in an affault, that he did it out of

JUSTIFICATION, in theology, that act of grace which renders a man just in the fight of God, and worthy of

eternal happiness. See THEOLOGY.

The Romanists and Reformed are extremely divided about the doctrine of justification; the latter contending for justification by faith alone, and the former by good works.

JUSTIN, a celebrated historian, lived, according to the most probable opinion, in the fecond century, under the reign of Antoninus Pius. He wrote, in elegant Latin, an abridgment of the history of Trogus Pompeius; comprehending the actions of almost all nations, from Ninus the founder of the Affyrian empire to the emperor Augustus. The original work, to the regret of the learned, is loft: this abridgment, being written in a police and elegant ftyle, was probably the reason why that age neglected the original. The best editions of Justin are, ad usum Delphini, in 4to; and cum notis variorum et Gronovii

JUSTIN (St), commonly called Justin Martyr, one of the earliest and most learned writers of the eastern church, was born at Ncapolis, the ancient Sechem of Palestine. His father Prifcus, a Gentile Greek, brought him up in his own religion, and had him educated in all the Grecian learning. To complete his fludies he travelled to Egypt; and followed the feet of Plato. with whose intellectual notions he was much pleased, But one day walking by the fea-fide, wrapt in contemplation, he was met by a grave ancient perfor of a venerable aspect; who, falling into discourse with him, turned the conversation by degrees from the excellence of Platonism to the superior perfection of Christianity; and reasoned so well, as to raise in him an ardent curiofity to inquire into the merits of that religion; in confequence of which inquiry, he was converted about the year 132. On his embracing that religion, he quitted neither the profession nor the habit of a philosopher : but a perfecution breaking entire leaves, growing opposite; and white flowers, out under Antoninus, he composed An Apology for the commonly by threes, from the fides of the branches; Christians; and afterwards prefented another to the fucceeded by capfules, which burth open with elastic emperor Marcus Aurelius, in which he vindicated the force for the discharge of the seeds; whence the name innocence and holiness of the Christian religion against of fnap-tree. Both species flower here in summer, but Crescens a Cynic philosopher, and other calumnianever produce any fruit. They are propagated by tors. He did honour to Christianity by his learning

Juffinian, and the purity of his manners; and fuffered martyrfill extant his Dialogue with Tryhpo, a Jew; two treatifes addressed to the Gentiles, and another on the unity of God. Other works are also ascribed to him. The heft editions of St Justin are those of Robert Stephens, in 1551 and 1571, in Greek and Latin: that of Morel, in Greck and Latin, in 1556; and that of Don Prudentius Marandus, a learned Benedictine, in 1742 in folio. His ftyle is plain, and void of all ornament.

JUSTINIAN I. for of Justin the elder, was made Cæfar and Augustus in 527, and foon after emperor. He conquered the Perfians by Belifarius his general, and exterminated the Vandals; regained Africa; fubdued the Goths in Italy; defeated the Moors; and reflored the Roman empire to its primitive glory. See (Hiftory of) Constantinople, no 93--- 97. and

ITALY, nº 12, &c.

The empire being now in the full enjoyment of a profound peace and tranquillity, Justinian made the best use of it, by collecting the immense variety and number of the Roman laws into one body. To this end, he felected ten of the most able lawyers in the empire; who, revifing the Gregorian, Theodofian, and Hermogenian codes, compiled one body, called Codex Justinianus. This may be called the statute law, as confifting of the rescripts of the emperors. But the reduction of the other part was a much more difficult talk: it was made up of the decisions of the judges and other magistrates, together with the authoritative opinions of the most eminent lawyers; all which lay feattered, without any order, in no less than 2000 volumes and upwards. These were reduced to the number of 50; but ten years were spent in the reduction. However, the defign was completed in the year 553, and the name of Digests or Pandetts given to it. Befides these, for the use chiefly of young students in the law to facilitate that study, Justinian ordered four books of inftitutes to be drawn up, containing an abstract or abridgement of the text of all the laws: and, laftly, the laws of modern date, posterior to that of the former, were thrown into one volume in the year 541, called the Novella, or New Code.

This emperor died in the year 565, aged 83, in the 30th of his reign, after having built a great number of churches; particularly the famous Sancta Sophia at Constantinople, which is esteemed a master-

piece of architecture.

IUSTINIANI (St Laurence), the first patriarch of Venice, was born there of a noble family in 1381. He was a very pious prelate, and died in 1485; he left feveral pieces of piety, which were printed together at Lyons in 1568, in one volume folio, with his life prefixed by his nephew. Clement VII. beatified him in 1524, and he was canonized by Alexander VIII. in 1600.

JUSTINIANI (Bernard), was born at Venice in 1408. He obtained the fenator's robe at the age of 10, ferved the republic in feveral embaffies, and was elected procurator of St Mark in 1474. He was a learned man, and wrote the Hiftory of Venice, with fome other works of confiderable merit; and died in 1498.

Nº 171.

JUSTINIANI (Augustin), bishop of Nebo, one of Justiniani the most learned men of his time, was descended from a branch of the fame noble family with the two foregoing; and was born at Genoa in 1480. He affifted at the fifth council of Lateran, where he opposed some articles of the concordat between France and the court of Rome. Francis I. of France made him his almoner; and he was for five years regius professor of Hebrew at Paris. He returned to Genoa in 1522, where he discharged all the duties of a good prelate; and learning and piety flourished in his diocese. He perished at sea in his passage from Genoa to Nebbio, in 1536. He composed several pieces; the most confiderable of which is, Pfalterium Hebraum, Gracum, Arabicum, et Chaldaum, cum tribus Latinis interpretationibus et glossis. This was the first pfalter of the kind printed; and there is also ascribed to the same prelate a translation of Maimonides's Moore Nevochim-

JUSTNESS, the exactness or regularity of any thing.

Justness is chiefly used in speaking of thought, language, and fentiments. The justness of a thought confifts in a certain precision or accuracy, by which every part of it is perfectly true, and pertinent to the subject. Justness of language confists in using proper and well chosen terms; in not faying either too much or too little. M. de Mere, who has written on justness of mind, distinguishes two kinds of justness; the one arifing from tafte and genius, the other from good fense or right reason. There are no certain rules to be laid down for the former, viz. to show the beauty and exactness in the turn or choice of a thought: the latter confilts in the just relation which things have to one another.

JUTES, the ancient inhabitants of Jutland in Den-

mark.

JUTLAND, a large peninfula, which makes the principal part of the kingdom of Denmark. It is bounded on the fouth-east by the duchy of Holftein. and is furrounded on the other fides by the German ocean and the Baltic fea. It is about 180 miles in length from north to fouth, and 50 in breadth from east to west. The air is very cold but wholesome: and the foil is fertile in corn and pastures, which feed a great number of beeves, that are fent to Germany, Holland, and elfewhere. This was anciently called the Cimbrian Cherfonesus, and is supposed to be the country from whence the Saxons came into England. It is divided into two parts, called North and South Julland: the latter is the duchy of Slefwick, and hes between North Jutland and the duchy of Holftein; and the duke of that name is in poffession of part of ir, whose capital town is Gottorp, for which reason the fovereign is called the duke of Holftein Gottorp.

JUVENAL (Decius Junius), the celebrated Roman fatyrift, was born about the beginning of the emperor Claudian's reign, at Aquinum in Campania. His father was probably a freed-man, who, being rich. gave him a liberal education, and, agreeably to the tafte of the times, bred him up to eloquence; in which he made a great progress, first under Fronto the grammarian, and afterwards, as is generally conjectured, under Quintilian; after which he attended the bar. and made a diftinguished figure there for many years by his eloquence. In the practice of this profession

Yuflice Tuxon.

he had improved his fortune and interest at Rome before he turned his thoughts to poetry, the very style of which, in his fatires, speaks a long habit of declamation; fuba@um redulent declamatorem, fay the critics. It is faid he was above 40 years of age when he recited his first essay to a small audience of his friends; but bei encouraged by their applause, he ventured publication: which reaching the ears of avourite at that time, though but Paris. I anyer, whom our fatyrist had feverely a panto... infulted, that minion made his complaint to the emperor; who fent him thereupon into banishment, under pretence of giving him the command of a cohort in the army, which was quartered at Pentapolis, a city upon the frontiers of Egypt and Libya.

After Domitian's death, our fatyrist returned to Rome, fufficiently cautioned not only against attacking the characters of those in power, under arbitrary princes, but against all personal reslections upon the great men then living; and therefore he thus wifely concludes the debate he is supposed to have maintained for a while with a friend on this head, in the first fatire, which feems to be the first that he wrote after

Experiar quid concedatur in illos Quorum Flaminia tegitur cinis atque Latina.

" I will try what liberties I may be allowed with those whose ashes lie under the Flaminian and Latin ways," along each fide of which the Romans of the first quality used to be buried .- It is believed that he lived till the reign of Adrian in 128. There are still extant 16 of his fatires, in which he discovers great wit, firength, and keennefs, in his language : but his flyle is not perfectly natural; and the obscenities with which these satires were filled render the reading of them dangerous to youth.

JUVENCUS (Caius Vecticus Aquilinus), one of the first of the Christian poets, was born of an illustrious family in Spain. About the year 320 he put tne life of Jesus Christ into Latin verse, of which he composed four books. In this work he followed almost word for word the text of the four evangelists: but his verses are written in a bad taste, and his La-

tin is not pure.

JUVENTAS, in mythology, the goddess who prefided over youth among the Romans. This goddess was long honoured in the Capitol, where Servius Tullius erected her statue. Near the chapel of Minerva there was the altar of Juventas, and upon this altar a picture of Proferpine. The Greeks called the goddefs of youth Hebe; but it has been generally fupposed that this was not the same with the Roman Tuwentas.

IUXON (Dr William), born at Chichester in 1682. was bred at Merchant Taylor's school, and from thence elected into St John's college Oxford, of which he became prefident. King Charles I. made him bishop of London; and in 1635 promoted him to the post of lord high treasurer of England. The whole nation, and especially the nobility, were greatly offended at this high office being given to a clergyman; but he behaved fo well in the administration, as foon put a stop to all the clamour raised against him. This place he held no longer than the 17th of May 1641, when married Dia the daughter of Deionius, to whom he

Vol. IX. Part II.

he prudently refigned the staff, to avoid the storm Juxtaposiwhich then threatened the court and the clergy. In the following February, an act passed depriving the bishops of their votes in parliament, and incapacitating them from any temporal jurisdiction. In these leading steps, as well as the total abolition of the episcopal order which followed, he was involved with his brethren; but neither as bishop nor as treasurer was a fingle accufation brought against him in the long parliament. During the civil wars, he refided at his palace at Fulham, where his meek, inoffensive, and genteel behaviour, notwithstanding his remaining steady in his loyalty to the king, procured him the vifits of the principal persons of the opposite party, and respect from all. In 1648, he attended on his majesty at the treaty in the ifle of Wight; and by his particular defire, waited upon him at Cotton-house, Westminster, the day after the commencement of his trial; during which he frequently vifited him in the office of a spiritual father; and his majefty declared he was the greatest comfort to him in that afflictive fituation. He likewife attended his majefly on the scaffold, where the king taking off his cloak and George, gave him the latter: after the execution, our pious bishop took care of the body, which he accompanied to the royal chapel at Windfor, and flood ready with the commonprayer book in his hands to perform the last ceremony for the king; but was prevented by Colonel Whichcot, governor of the caftle.-He continued in the quiet possession of Fulham-palace till the ensuing year 1649, when he was deprived, having been spared longer than any of his brethren. He then retired to his own estate in Gloucestershire, where he lived in privacy till the restoration, when he was presented to the fee of Canterbury; and in the little time he enjoyed it, expended in buildings and reparations at Lambeth-palace and Croyden-houfe near 15,0001. He died in 1663; having bequeathed 7000l. to St John's college, and to other charitable uses near 5000 l. He published a Sermon on Luke xviii. 31. and Some Confiderations upon the Act of Uniformity.

JUXTAPOSITION, is used by philosophers to denote that species of growth which is performed by the apposition of new matter to the surface or outside of old. In which fenfe it stands opposed to intuffusception; where the growth of a body is performed by the reception of a juice within it diffused through

IVY, in botany. See HEDERA.

IXIA, in botany: A genus of the monogynia order, belonging to the triandria class of plants; and in the natural method ranking under the 6th order, Enfate. The corolla is hexapetalous, patent, and equal; there are three fligmata a little upright and petalous. There are feveral species, confisting of herbaceous, tuberous, and bulbous-rooted flowery perennials, from one to two feet high, terminated by hexapetalous flowers of different colours. They are propagated by off-fets, which should be taken off in summer at the decay of the leaves: but as all the plants of this genus are natives of warm climates, few of them can bear the open air of this country in winter.

IXION, in fabulous history, king of the Lapithæ, 3 G

Ixora, Jynx.

Plate.

refused to give the cultomary nuptial presents. Deconius in revenge took from him his horses; when Ixion, dissembling his resemble the third him to a feat, and made him fall through a trap-door into a burning furnace, in which he was immediately confumed. Ixion being afterwards stung with remorse for his cruelty, raif mad; on which Jupiter, in compassion, not only forgave him, but took him up into heaven, where he had the impiety to endeawour to sorrupt Juno. Jupiter, to be the better assured of his guilt, formed a cloud in the resemblance of the goddess, upon which Ixion begat the centaurs: but boalting of his happiness, Jove hurded him down to Tartarus, where he lies fixed on a wheel-encompassed with serpents, which turns without ceasing.

IXORA, in botany: A genus of the monogynia order, belonging to the tetrandria class of plants, and in the natural method ranking under the 47th order, Stellate. The corolla is monopetalous, funnel-shaped, and long, superior; the stamina above the throat; the

berry tetraspermous.

JYNX, in ornithology, a genus of birds belonging to the order of picæ; the characters of which are, that the bill is flender, round, and pointed; the no-firils are concave and naked; the tongue is very long, very flender, cylindric, and terminated by a hard point; and the feet are formed for climbing. There is only one fpecies, wie. the torquilla. The colours of this bird are elegantly pencilled, though its plumage is marked with the plainest kinds; a lift of black and ferruginous trokes divides the top of the head and back; the fides of the head and neck are as coursed, beautifully traveried with fine lines of black and red-dish-brown; the quill-feathers are dusky, but each web

is marked with ruft-coloured fpots; the chin and breaft are of a light yellowish-brown, adorned with sharp-pointed bars of black; the tail consists of ten feathers, broad at their ends and weak, of a pale ashcolour, powdered with black and red, and marked with four equidiftant bars of black : the irides are of a yellowish colour .- The wry-neck, Mr Pennant apprehends, is a bird of passage, appearing with us in the fpring before the cuckoo. Its note is like that of the keftril, a quick-repeated fqueak; its eggs are white, with a very thin shell; it builds in the hollows of trees. making its neft of dry grass. It has a very whimfical way of turning and twifting its neck about, and bringing its head over its shoulders, whence it had its Latinname torquilla, and its English one of very neck : it has also the faculty of erecting the feathers of the head like those of the jay. It feeds on ants, which it very dexteroufly transfixes with the bony and sharp end of its tongue, and then draws them into its mouth; and while the female is fitting, the male has been observed to carry these insects to her. - We find this bird mentioned as an inhabitant throughout Europe, and of many parts of the old Continent. It is in Russia, Sweden, Lapland, Greece, Italy, Babylon, and Bengal; authorities for which Buffon mentions, and fays, that at the end of fummer this bird grows very fat, when it becomes excellent eating; for which reason fome have named it the Ortolan. The young ones, while in the neft, will hifs like to many fnakes; infomuch that many have been prevented plundering the old ones of their offspring, on supposition that they were advancing their hands on the brood of this loath. fome reptile.

K.

K, the tenth letter, and feventh confonant, of our trad expression of the breath through the mouth, together with a depression of the lower jaw and opening of the teeth.

Its found is much the fame with that of the hard c_i or qu: t and it is ufed, for the most part, only before e_i i, and m_i in the beginning of words; as ken_i $kill_i$, $knew_i$. &c. It ufed formerly to be always joined with e at the end of words, but is at perfect very properly omitted, at least in words derived from the Latin: thus, for publick, $mufick_i$, &c. we say, public, $mufic_i$ &c. However, in monofyllables, it is till retained, as $jauk_i$, block.

mock. &cc.

K is borrowed from the Greek kappa; and was but little used among the Latins: Prifesian looked on it as a superstuous letter; and says, it was never to be used except in words borrowed from the Greek. Dausquius, after Sallust, observes, that it was unknown to the ancient Romans.—Indeed we feldom find it in any Latin authors, excepting in the word kalends, where it sometimes stands in lieu of a e.—Carthage, however, is frequently splet on medals with a K; SALVIS AUGIETICAES.FEL.KART. and sometimes the letter Kalone shood for Carthage.—M. Berger hasobierved, that a capital K; on the reverse of the medals of the

emperors of Conflantinople, fignified Konflantinus; and on the Greek medals he will have it to fignify.

KOIAH ETPIA, "Coelefyria."

Quintilian tells us, that in his time some people had a miliaken notion, that wherever the letter c and a occurred at the beginning of a word, k ought to be used instead of the c. See C.

Lipfius observes, that K was a stigma anciently marked on the foreheads of criminals with a red-

The letter K has various fignifications in old charters and diplomas; for initance, KR. flood for chorus, KR. C. for cara civitas, KR.M. for carmon, KR. A.M. N. carus amicus nofter, K.S. chaos, K.T. capite tonfus, &c.

The French never use the letter k excepting in a few terms of art and proper names borrowed from other countries. Ablancourt, in his dialogue of the letters, brings in k complaining, that he has been often in a fair way to be bauished out of the French alphabet, and confined to the countries of the north.

K is also a numeral letter, fignifying 250, according to the verse;

K quoque ducentos & quinquaginta tenebit.

When it had a stroke at top, K, it stood for 250,000.

K on the French coinage denotes money coined at Bourdeaux.

KABA. See MECCA.

Kalendar.

KADESH, KADESH-BARNEA, OF EN-MISHPAT (anc. geog.), a city celebrated for feveral events. At Kadesh, Miriam the fister of Moses died (Numb. xx. 1.). Here it was that Mofes and Aaron, showing a diftrust in God's power when they fmote the rock at the waters of strife, were condemned to die, without the confolation of entering the promifed land (Numb. xxvii. 14.). The king of Kadesh was one of the princes killed by Joshua (xii. 22.). This city was given to the tribe of Judah, and was fituated about eight leagues from Hebron to the fouth.

Mr Wells is of opinion, that this Kadesh, which was fituated in the wilderness of Zin, was a different place from Kadesh-barnea in the wilderness of Paran

KADMONÆI, or CADMONÆI (anc. geog.), a people of Palestine, faid to dwell at the foot of mount Hermon; which lies east, and is the reason of the appellation, with respect to Libanus, Phoenicia, and the north parts of Palestine. Called also Hevai (Moses).

KÆMPERIA, ZEDOARY, in botany: A genus of the monogynia order, belonging to the monandria class of plants; and in the natural method ranking under the 8th order, Scitaminea. The corolla is fexpartite, with three of the fegments larger than the reft, patu-

lous: and one only bipartite.

Species. 1. The galanga, common galangal, or long zedoary, has tuberous, thick, oblong, fleshy .roots; crowned with oval, clofe-fitting leaves, by pairs, four or five inches long, without footflalks; and between them close-fitting white flowers, with purple bottoms, growing fingly. 2. The rotunda, or round zedoary, has thick, fleshy, swelling, roundish, clustering roots, fending up spear-shaped leaves, fix or eight inches long, near half as broad, on upright footflalks; and between them, immediately from the roots, rife whitish flowers, tinged with green, red, yellow, and purple, Both thefe are perennial in root; but the leaves rife annually in fpring, and decay in winter. They flower in fummer: each flower is of one petal, tubulous below, but plain above, and divided into fix parts; they continue three or four weeks in beauty, but are never succeeded by feeds in this country.

Culture. Both these plants must be potted in light rich mould, and always kept in the hot-house, giving in plenty of water in fummer, but more sparingly in winter. They are propagated by parting the roots in the fpring, just before they begin to push forth new

Uses. This plant is cultivated with great care by the inhabitants of Siam for the fake of its root; the use of which, fays Kempfer, is to remove obstructions of the hypochondria, to warm the stomach, discuss statulencies, and to strengthen the bowels and the whole nervous system. The root was formerly used in this country in bitter infusions; but is now laid aside, on account of its flavour being difagreeable.

KALENDAR, a distribution of time, accommodated to the uses of life; or a table or almanac, containing the order of days, weeks, months, featts, &c. happening throughout the year. See TIME, MONTH,

YEAR, &c.

K A It is called kalendar, from the word kalenda, ancient- Kalendar, ly wrote in large characters at the head of each month,

See KALENDS.

The days in kalendars were originally divided into ocloades, or eights; but afterwards, in imitation of the Jews, into hebdomades, or fevens; which cuftom, Scaliger observes, was not introduced among the Romans till after the time of Theodofius.

There are divers kalendars, according to the different forms of the year and distributions of time established in different countries. Hence the Roman, the Jewish, the Persian, the Julian, the Gregorian, &c. ka-

The ancient Roman kalendar is given by Ricciolus. Struvius, Danet, and others; by which we fee the order and number of the Roman holidays and work-days.

The three Christian kalendars are given by Wolfius

in his Elements of Chronology.

The Jewish kalendar was fixed by rabbi Hillel about the year 360, from which time the days of their year may be reduced to those of the Julian kalendar.

The Roman KALENDAR owed its origin to Romu-Ius; but it has undergone various reformations fince his time. That legislator distributed time into feveral periods, for the use of the people under his command! but as he was much better verfed in matters of war than of aftronomy, he only divided the year into ten months, making it begin in the fpring, on the first of March; imagining the fun made his courfe through all the feafons in 304 days.

Romulus's kalendar was reformed by Numa, who added two months more, January and February; placing them before March: fo that his year confifted of 355 days, and began on the first of January. He chose, however, in imitation of the Greeks, to make an intercalation of 45 days, which he divided into two parts; intercalating a month of 22 days at the end of each two years; and at the end of each two years more another of 23 days; which month, thus interpofed, he called Marcedonius, or the intercalary Fe-

But these intercalations being ill observed by the pontiffs, to whom Numa committed the care of them. occasioned great disorders in the constitution of the year; which Cæfar, as fovereign pontiff, endeavoured to remedy. To this end, he made choice of Sofigenes, a celebrated astronomer of those times; who found, that the dispensation of time in the kalendar could never be fettled on any fure footing without having regard to the annual course of the sun. Accordingly, as the fun's yearly course is performed in 365 days fix hours, he reduced the year to the fame number of days: the year of this correction of the kalendar was a year of confusion; they being obliged, in order to fwallow up the 65 days that had been imprudently added, and which occasioned the confusion. to add two months besides the Marcedonius, which chanced to fall out that year; fo that this year confifted of 15 months, or 445 days. This reformation was made in the year of Rome 708, 42 or 43 years before Christ.

The Roman kalendar, called also Julian kalendar, from itsreformer Julius, is disposed into quadriennial periods; whereof the first three years, which he called communes, confift of 365 days; and the fourth, biffextile, of 366;

3 G 2 by

a day or fomewhat less, for in 134 years an interca- and disposition whereof, see Epact. lary day is to be retrenched. On this account it was, that pope Gregory XIII. with the advice of Clavius and Ciaconius, appointed, that the hundredth year of each

century fhould have no biffextile, excepting in each fourth century: that is, a subtraction is made of three biffextile days in the space of four centuries; by reason of the 11 minutes wanting in the fix hours whereof the biffextile confifts.

The reformation of the kalendar, or the new Ayle, as we call it, commenced on the 4th of October 1582, when ten days were thrown out at once, fo many having been introduced into the computation fince the time of the council of Nice in 325, by the defect of

11 minutes.

Julian Christian KALENDAR, is that wherein the days of the week are determined by the letters A, B, C, D, E, F, G, by means of the folar cycle; and the new and full moons, especially the paschal full moon, with the feast of Easter, and the other moveable feasts depending thereon, by means of golden numbers, rightly disposed through the Julian year. See CYCLE, and GOLDEN Number.

In this kalendar, the vernal equinox is supposed to be fixed to the 21ft day of March; and the cycle of 19 years, or the golden numbers, conflantly to indicate the places of the new and full moons; yet both are erroneous. And hence arose a very great irregularity in the time of Easter. To show this error the more apparently, let us apply it to the year 1715. In this year, then, the vernal equinox falls on the 10th of March; and therefore comes too early by 11 days. The paschal full moon falls on the 7th of April; and therefore too late, with regard to the cycle, by three days: Easter, therefore, which should have been on the 10th of April, was that year on the 17th. The error here lies only in the metemptofis, or postposition of the moon, through the defect of the lunar cycle. If the full moon had fallen on the 11th of March, Easter would have fallen on the 13th of March; and therefore the error arifing from the anticipation of the equinox would have exceedingly augmented that ariling from the postposition. These errors, in course of time, were so multiplied, that the kalendar no longer exhibited any regular Easter. Pope Gregory XIII. therefore, by the advice of Aloysius Lilius, in 1582, threw 10 days out of the month of October, to restore the eq inox to its place, viz. the 21st of March; and thus introduced the form of the Gregorian year, with fuch a provision, as that the equinox should be constantly kept to the 21st of March. The new moons and full moons, by advice of the fame Lilius, were not to be indicated by golden numbers, but by epacts. The kalendar, however, was fill retained in Britain without this correction : whence there was a difference of 11 days between our sime and that of our neighbours. But by 24 Geo. II. c. 23. the Gregorian computation is established here, and accordingly took place in 1752.

Gregorian KALENDAR, is that which, by means of epacts, rightly disposed through the several months, determines the new and full moons, and the time of Eafler, with the moveable feafts depending thereon, in

the Gregorian year.

Julian, both in the form of the year, and in that epacts year into those of another; the differences in the se-

Kalendar, by reason of the fix hours, which in four years make are substituted in lieu of golden numbers; for the use Kalendar-

Though the Gregorian kalendar be preferable to the Julian, yet it is not without its defects (perhaps, as Tycho Brahe and Caffini imagine, it is impossible ever to bring the thing to a perfect justness). For, first, the Gregorian intercalation does not hinder, but that the equinox fometimes fucceeds the 21st of March as far as the 23d; and fometimes anticipates it, falling on the 10th; and the full moon, which falls on the 20th of March, is fometimes the pafchal; yet not fo accounted by the Gregorians. On the other hand, the Gregorians account the full moon of the 22d of March the paschal; which yet, falling before the equinox, is not paschal. In the first case, therefore, Easter is celebrated in an irregular month; in the latter, there are two Eafters in the fame ecclefiaftical year. In like manner, the cyclical computation being founded on mean fullmoons, which yet may precede or follow the true ones by fome hours, the paschal full-moon may fall on Saturday, which is yet referred by the cycle to Sunday : whence, in the first case, Easter is celebrated eight days later than it should be; in the other, it is celebrated on the very day of the full-moon, with the Jews and Quartodeciman heretics; contrary to the decree of the council of Nice. Scaliger and Calvifius show other faults in the Gregorian kalendar, arifing from the negligence and inadvertency of the authors; yet is this kalendar adhered to by the Romanists throughout Europe, &c. and used wherever the Roman breviary is used.

Refor ed, or Correlled KALENDAR, is that which, fetting aside all apparatus of golden numbers, epacts. and dominical letters, determines the equinox, with the pafchal full-moon, and the moveable fealts depending thereon, by aftronomical computation, according to the

Rudolphine Tables.

This kalendar was introduced among the Protestant flates of Germany in the year 1700, when 11 days were at once thrown out of the month of February; fo that in 1700 February had but 18 days: by this means. the corrected flyle agrees with the Gregorian. This alteration in the form of the year they admitted for a time; in expectation that, the real quantity of the tropical year being at length more accurately determined by observation, the Romanists would agree with them on fome more convenient intercalation.

Confirution of a KALENDAR, OI Almanac. 1. Compute the fun's and moon's place for each day of the year; or take them from ephemerides. 2. Find the dominical letter, and by means thereof distribute the kalendar into weeks. 3. Compute the time of Ea-fter, and thence fix the other moveable feafts. 4. Add the immoveable feafts, with the names of the martyrs. 5. To every day add the fun's and moon's place, with the rifing and fetting of each luminary; the length of day and night; the crepufcula, and the afpects of the planets. 6. Add in the proper places the chief phases of the moon, and the fun's entrance into the cardinalpoints; i. e. the folfices and equinoxes; together with the rifing and the fetting, especially heliacal, of the planets and chief fixed flars. See Astronomy.

The duration of the crepufcula, or the end of the evening and beginning of the morning twilight, together with the fun's rifing and fetting, and the length The Gregorian kalendar, therefore, differs from the of days, may be transferred from the kalendars of one

Kalendar, veral years being too small to be of any consideration declination, rising, setting, amplitude, &c. to a greater Kalendar in civil life.

Hence it appears, that the confiruction of a kalendar has nothing in it of mystery or difficulty, if tables of the heavenly motions be at hand.

Some divide kalendars or almanacs into public and private, perfect and imperfect; others into Heathen

and Christian. Public almanacs are those of a larger fize, usually hung up for common or family use; private are those of a smaller kind, to be carried about either in the hand, inscribed on a staff, or in the pocket; perfect, those which have the dominical letters as well as primes and fealts inscribed on them; imperfect, those which have only the primes and immoveable feafts. Till about the fourth century, they all carry the marks of heathen-

ism; from that age to the seventh, they are generally

divided between heathenism and Christianity. Almanacs are of fomewhat different composition, fome containing more points, others fewer. The effential part is the kalendar of months and days, with the rifing and fetting of the fun, age of the moon, &c. To these are added various parerga, astronomical, aftrological, meteorological, chronological, and even political, rural, medical, &c. as calculations, and accounts of eclipses, folar ingresses, aspects, and configurations of the heavenly bodies, lunations, heliocentrical and geocentrical motions of the planets, prognostics of the weather, and predictions of other events, tables of the planetary motions, the tides, terms interest, twi-

light, equation, kings, &c. Gelalean, or Jellalean KALENDAR, is a correction of the Perfian kalendar, made by order of fultan Gelaleddan, in the 467th year of the Hegira; of Christ

KALENDAR, is also applied to divers other composi-

tions respecting the 12 months of the year. In this fense, Spencer has given the shepherd's ka-

lendar; Evelyn and Miller the gardener's kalendar, &c. KALENDAR, is used for the catalogue or fasti anciently kept in each church of the faints both univerfal and those particularly honoured in each church; be confounded with martyrologies; for each church had its peculiar kalendar, whereas the martyrologies regarded the whole church in general, containing the martyrs and confessors of all the churches. From all the feveral kalendars were formed one martyrology : fo that martyrologies are posterior to kalendars.

KALENDAR, is also extended to an orderly table or

enumeration of persons or things.

Lord Bacon wishes for a kalendar of doubts. A late writer has given a kalendar of the persons who may

inherit estates in fee-fimple.

KALENDAR, Kalendarium, originally denoted, among the Romans, a book containing an account of moneys ary, the usual time when the Roman usurers let out Nones.

KALENDAR Months, the folar months, as they stand in the following verses:

in the kalendar, viz. January 31 days, &c.

Aftronomical KALENDAR, an instrument engraved upon copper-plates, printed on paper, and pasted on board, with a brass slider which carries a hair, and shows by inspection the sun's meridian altitude, right ascension, exactness than our common globes will show.

KALENDAR of Prisoners. See CALENDAR.

KALENDAR Brothers, a fort of devout fraternities, composed of ecclesiastics as well as laymen; whose chief business was to procure masses to be faid, and alms diftributed, for the fouls of fuch members as were deceased. They were also denominated kalend brothers, because they usually met on the kalends of each month, though in fome places only once a quarter.

Kalenda.

*KALENDARIUM FESTUM. The Christians retained much of the ceremony and wantonness of the kalends of January, which for many ages was held a feast, and celebrated by the clergy with great indecencies, under the names festum kalendarum, or hypodiaconorum, or fultorum, that is, " the feast of fools :" fometimes also libertas decembrica. The people met masked in the church; and in a ludicrous way proceeded to the election of a mock pope, or bishop, who exercised a jurisdiction over them suitable to the festivity of the occasion. Fathers, councils, and popes, long laboured to restrain this licence to little purpose. the feast of the kalends in use as low as the close of the 15th century

KALENDERS. See CALENDERS.

KALENDS, or CALENDS, in the Roman chronology, the first day of every month .- The word is formed from xaxew I call or proclaim; because, before the publication of the Roman fasti, it was one of the offices of the pontifices to watch the appearance of the new moon, and give notice thereof to the rex facrificulus : upon which a facrifice being offered, the pontiff fummoned the people together in the Capitol, and there with a loud voice proclaimed the number of kalends, or the day whereon the nones would be; which he did by repeating this formula as often as there were days of kalends, Calo Juno Novella. Whence the name calenda was given thereto, from calo, calare. This is the account given by Varro. Others derive the appellation hence, That the people being convened on this day, the pontifex called or proclaimed the feveral fealts or holidays in the month; a cultom which conwith their bishops, martyrs, &c. Kalendars are not to tinued no longer than the year of Rome 450, when C. Flavius, the curule ædile, ordered the fatti or kalendar to be fet up in public places, that every body might know the difference of times, and the return of the festivals.

The kalends were reckoned backwards, or in a retrograde order. Thus, v. g. the first of May being the kalends of May; the last or the 30th of April was the pridie kalendarum, or second of the kalends of May; the 29th of April, the third of the kalends, or before the kalends: and so back to the 13th, where the ides commence; which are likewife, numbered invertedly to the fifth, where the nones begin; which are numbered after the same manner to the first day of the at interest, which become due on the kalends of Janu month, which is the kalends of April. See IDES, and

The rules of computation by kalends are included.

Prima dies menfis cujusque est dicta kalendæ: Sex Maius nonas, October, Julius, & Mars; Quatuor at reliqui : habet idus quilibet octo. Inde dies reliquos omnes dic effe kalendas; Quas retro numerans dices a mense sequente.

Ka'ends To find the day of the kalends answering to any day of the month we are in ; fee how many days there are vet remaining of the month, and to that number add two: for example, suppose it the 22d day of April; it is then the 10th of the kalends of May. For April contains 30 days: and 22 taken from 30, there remains 8; to which two being added, the fum is 10. The reason of adding two is, because the last day of the month is called fecundo kalendas, the last but one tertio kalendas, &c.

The Roman writers themselves are at a loss for the reason of this absurd and whimsical manner of computing the days of the month: yet it is still kept up in the Roman chancery; and by fome authors, out of a vain affectation of learning, preferred to the common, more natural, and easy manner.

KALENDS, are also used in church-history to denote conferences anciently held by the clergy of each deanry, on the first day of every month, concerning their duty and conduct, especially in what related to the

imposition of penance.

KALENDS of January, in Roman antiquity, was a folemn festival conseerated to Juno and Janus; wherein the Romans offered vows and facrifices to thofe deities, and exchanged prefents among themselves as a token of friendship.

It was only a melancholy day to debtors, who were then obliged to pay their interests, &c. Hence Horace calls it trifles kalenda; Lib. i. Serm. Sat. 3.

KALI, in botany. See SALSOLA.

KALISH, a province of Lower Poland, with the title of a palatinate. It is bounded on the west by the palatinate of Bosnia, on the east by that of Syrad, on the north by Regal Prussia, and on the fouth by Silefia. Kalish is the capital town.

KALISH, a town of Lower Poland, and capital of a palatinate of the same name, where the Jesuits have a magnificent college. It is feated on the river Profna, in a morals, which renders it difficult of access.

E. Long. 18. o. N. Lat. 52. 20.

KALMIA, in botany: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 18th order, Bicornes. The calyx is quinquepartite; the corolla falverthaped, formed with five nectariferous horns on the under or outer fide; the capfule quinquelocular. Of

this genus there are two species, viz.

1. The latifolia, a most beautiful shrub, which rifes usually to the height of five or fix feet, and sometimes twice that height in its native places. The stems of some are as big as the fmall of a man's leg, though generally they are fmaller, and covered with a brown rough bark. The wood is very close grained, heavy, and hard like box. The limbs in general are crooked, and grow irregular; but are thick-clothed with stiff smooth leaves of a fhining bright green. The flowers grow in bunches on the tops of the branches to foot-stalks of three inches long: they are white, flained with purplish red, confifting of one leaf in form of a cup divided at the verge into five fections: in the middle is a ftylus and 12 ftamina; which, when the flower first opens, appear lying close to the fides of the cup at equal distances, their apices being lodged in ten little hollow cells, which being prominent on the outfide, appear as fo many little tubercles. The flowers are fucceeded by fmall round capfules; which when ripe open in five

parts, and discharge their small dust like seeds. This Kalmis, plant is a native of Carolina, Virginia, and other parts Kalmuca, of the northern continent of America; yet are not common, but are found only in particular places : they grow on rocks hanging over rivulets and running fireams, and on the fides of barren hills. They bloffom in May, and continue in flower the greatest part of the fummer. The noxious qualities of this elegant plant lessen that esteem which its beauty claims: for although deer feed on its green leaves with impunity, yet when cattle and sheep, by severe winters deprived of better food, feed on the leaves of these plants, a great many of them die annually.

2. The angultifolia, rifes to the height of about 16 feet, producing ever-green leaves in shape like the lauro-cerasus, but small, and of a shining dark green. The flowers grow in clusters, the buds of which appear in autumn wrapped up in a conic fealy perianthium, on which is lodged a vifcous matter, which protects them from the severe cold in winter. These buds dilating in the following spring, break forth into twenty or more monopetalous flowers divided into five fegments, and fet fingly on pedicles half an inch long. These flowers, when blown, appear white; but on a near view are of a faint bluish-colour, which as the flower decays grow paler. One of the five petals is longer and more concave than the rest, and is blended with purple, green, and yellow specks, being a viscous matter on the extremities of very fine hairs. The convex fide of the fame petal is also speckled with vellowish green. The pointal rises from the centre of the flower, and has its head adorned with fearlet, and furrounded by 10 stamina, whereof three are long and feven short, whose farina issues out at a small round hole at its top. This elegant tree adorns the western and remote parts of Pennsylvania, always growing in the most sterile foil, or on the rocky declivities of hills and river banks, in spady moist places.

KALMUCS, a tribe of Tartars, called also Eluths, inhabiting the larger half of what the Europeans call Western Tartary. Their territory extends from the Caspian sea, and the river Yaik or Ural, in 72 degrees of longitude from Ferro, to mount Altay, in 110 degrees, and from the 40th to the 52d degree of north latitude; whence it may be computed about 1930 miles in length from west to east, and in breadth from north to fouth about 650 miles where broadeft. It is bounded on the north by Russia and Siberia, from which it is separated by a chain of mountains; on the east by mount Altay; on the fouth by the countries of Karazm and the two Bukharias, from which it is also separated partly by a chain of mountains and partly by fome rivers. See TARTARY.

Of the Kalmuc Tartars the following curious account is given by professor Pallas. They are in general, tays he, of a middle fize, and it is even rare to fee among them a perfon that is tall; the women especially are of low stature, and have very agreeable features. Their limbs are neatly turned, and very few have any defects contracted in infancy. Their education being left folely to nature, procures for them a well formed body and found conflictution. The only defect which is common among them is their having the thighs and legs fomewhat bent. A fat person is hardly ever to be met with; the richest and most distinguished, though they lead a life fufficiently indolent, and enjoy abun-

almues dance of every thing they defire, are never exceffively corpulent. Their skin is pretty fair, especially when young; but it is the cultom of the lower fort to allow their male children to go quite naked both in the heat of the fun and in the fmoky atmosphere of their felt huts; the men too fleep naked, covered only with their drawers: and from thefe circumstances they acquire that yellowish brown colour which characterises them. The women, on the contrary, have a very delicate complexion; among those of a certain rank are found some with the most beautiful faces, the whiteness of which is fet off by the fine black of their hair; and in this as well as in their features they perfectly refemble the figures in Chinese paintings.

The physiconomy which distinguishes the Kalmucs is pretty generally known. Strangers are made to believe that it is frightfully deformed; and though indeed there are very ugly men to be found, yet in general their countenance has an openhels in it that befpeaks a mild, a frank, and focial disposition. In many it is of a roundish shape, and exceedingly agreeable; among the women fome would be thought beauties even in those European cities where the taste is most ferupulous. The characteristic features of a Kalmuc or Mongul countenance are the following: The interior angle of the eye is placed obliquely downwards towards the noie, and is acute and fleshy; the eye-brows are black, narrow, and much arched; the nofe is of a ftructure quite fingular, being generally flat and broken towards the forehead; the cheek bone is high, the head and face very round ; the eye is dark, the lips thick and flethy, the chin fhort, and the teeth exceeding white, continuing fo to old age; the ears are of an enormous fize. standing out from the head. These characters are more or less visible in each individual; but the person that poffesses them all in the highest degree is considered as the most beautifully formed.

Among all the Mongul nations, the men have much less beard than in our European countries, and among the Tartars it appears much later. The Kalmucs have most of it; and yet even with them the beard is very feanty and thin, and few have much hair on any other part of the body.

People that lead a pafforal life enjoy the bodily fenfes in the greatest perfection. The Kalmucs find the fubtilty of their fenfe of fmell very useful in their military expeditions, for by it they perceive at a diffance the fmoke of a fire or the smell of a camp. There are many of them who can tell by applying the nofe to the hole of a fox or any other quadruped if the animal be within or horses, the noise of an enemy, of a flock of sheep, or even of firayed cattle; they have only to firetch themfelves on the ground, and to apply their ear close to the turf. But nothing is more aftonishing than the acuteness of fight in most of the Kalmucs, and the extraordinary diffance at which they often perceive very minute objects, fuch as the dust raised by cattle or horfes, and this from places very little elevated; in immenfe level defarts, though the particular inequalities of the furface and the vapours which in fine weather are feen to undulate over the foil in great heats, confiderably increase the difficulty. They are also accustomed to alone.

These people possess many good qualities, which

give them a great superior ty over the wandering Tar- Kalmucs. tars. A certain natural fagacity, a focial disposition, hospitality, eageruess to oblige, fidelity to their chiefa, much curiofity, and a certain vivacity accompanied with good humour, which hardly ever fortakes even the most wretched among them, form the fair fide of their character. On the other hand, they are careless, fuperficial, and want true courage; befides, they are remarkable for credulity, distrust, and a natural inclination authorifed by cultom for drunkennels and debauchery, but especially for a great degree of cunning, which they too often practife. The disposition to indolence is common and natural, especially among the men, to all Afiatic nations, who lead a kind of life exempt from subjection and devoid of activity; but this is less to be perceived among the Kalmucs, on account of their natural vivacity, and does not prevent their endeavours to oblige. Those among them who exercife any little trade, or who are reduced by poverty to hire themselves to the Russians either for labour or for fishing, are very assidnous and indefatigable. They fleep but little, going to rest late and rifing with the fun. To fleep through the day, unless a perfon is drunk, is confidered by them as dishonourable. But their extreme dirtiness can neither be difguifed nor justified, and proceeds much more from their education, from the flovenlinefs attached to the profession of a herdsman, and from levity, than from laziness; for the Kalmuc women are indefatigable in whatever concerns domestic matters: and it is for this reason, as well as on the score of fensuality, that the Kirgifiens are eager to feize and carry them off whenever an opportunity prefents itself.

With regard to the intellectual faculties of the Kalmucs, notwithstanding their want of instruction and information, they poffels good natural parts, an excellent memory, and a firong defire to learn. They acquire the Ruffian language with great facility, and pronounce it well; in which last article they very much furpafs the Chinese. It would be very easy to civilize them, if their petulance and manner of life did not render it impracticable.

Although the Kalmucs are generally of a fanguine and cholcric temperament, they live more amicably together than one could expect in a people that lead fo independent a life. They feldom come to blows even over their cups, and their quarrels are hardly ever bloody. A murder very rarely happens, though their anger has fomething in it exceedingly fierce. It would feem that the morality of their religion, though exnot. They hear at a great distance the trampling of tremely idolatrous, has been able to moderate their natural disposition in this respect; for in confequence of their dogmas, with regard to the transmigration of fouls. every wanton murder either of men or beafts is thought a deadly fin.

The Kalmucs are exceedingly affable; and of fo focial a disposition, that it is rare for a traveller to perceive another even at the dillance of feveral miles without going to falute him, and to inquire into the object of his journey. When a troop of Kalmucs perceive any perfon at a diffance, it is customary for them to detach one of their number to the next eminence, from whence he makes a fignal with his cap for trace the print of a foot in these desarts by the fight the person to draw near. If this signal is not obeyed, the perfon is confidered as an enemy or a robber, and is often purfued as fuch. They enter willingly into friendKalmues. Thips: but these connections are not quite disinterest- that are most addicted to these practices; while the Kalmues. effential articles. A mere trifle, however, is sufficient they are never ungrateful as far as they are able. Adverfity cannot deprive them of courage nor alter their good humour. A Kalmuc will never beg if he were in the extremest misery, but rather endeavour to acquire a fubfiftence by cheating; and when no other way remains, he will hire himself to some rich individual of his nation, or to some Russian, either as a herdsman, a fisherman, or for any other fort of labour. Very few of the rich value themselves much upon their wealth : but those who do, show no contempt for the poor of their own nation; though the meaner fort pay their court very obsequiously to the rich, who are always furrounded with a swarm of idle dependants.

Nothing can be more prudent than that exercise of hospitality practifed by wardering nations: it is of the greatell advantage to those among them who travel across their desarts; and each individual who practifes it, may rely on reaping the benefit of it wherever he goes. A Kalmuc provided with a horfs, with arms and equipage, may ramble from one place to another for three months together, without taking with him either money or provisions. Wherever he comes he finds either distant relations or friends, to whom he is attached by the ties of hospitality, from whom he meets with the kindest reception, and is entertained in the best manner their circumstances afford. Perhaps he lodges in the first unknown cottage he finds upon his road : andifcarcely has he entered it, but his wants are Supplied with the most affectionate cordiality. Every ftranger, of whatfoever nation, never fails to be well received by a Kalmuc; and he may depend upon having his effects in the greatest security the moment he has put himself under the protection of his hoft : for to rob a guest is considered by the Kalmucs as the most abomin ble of all crimes.

Wien the mafter of the house fits down to meat in company with others of inferior rank, he begins indeed by ferving himfelf and his family, but whatever remains is distributed among the assistants. When they fmoke tobacco, the pipe circulates inceffantly from one to another. When any one receives a prefent either of meat or drink, he divides it faithfully with his companions, even though of inferior rank. But they are much more niggardly of their other effects, and especially of their cattle, and do not willingly give these away except when they hope to receive a suitable return : or if any relation has accidentally fuffered the loss of his flocks, he is fure to be most willingly affifted. Perhaps too it may be related as an article of their hospitality, that they abandon their wives to their friends with the greatest facility, and in general they are very little inclined to jealoufy.

Their robberies are never committed upon their equals, and even the greater part of the rapine exercifed on other tribes is founded on hatred or national quarrels; neither do they willingly attempt this by open force, but prefer the machinations of cunning, which are fo natural to them. It must also be confessed, that it is only those that live with princes, and in camps where these hold their courts, or their priests,

ed : for to give and to receive presents are with them common people, satisfied with the pleasures of the pastoral life, spend their days in innocent simplicity, to induce them to do you all manner of service; and and never attack the property of another till forced by necessity, or led by their superiors who show them the example.

The Kalmucs are very faithful to their lawful princes they endure every fort of oppression, and yet are with difficulty induced to revolt; but if they belong to a prince who has not become so by right of succession. they very eafily rebel. They honour old age. When young men travel with fuch as are older than themselves, they take upon them the whole care of the cattle as well as of the feaft. They are exceedingly prudent in matters that relate to their fovereign or their nation, or which are recommended to their direction by the priests, to whom they yield an unreser-

ved obedience. The moveable habitations of the Kalmucs are those felt huts with a conical roof in use among all the roaming Afiatics. The truly ingenious invention of these tents was undoubtedly conceived in the eastern parts of Asia, and most probably by the Mongul nations. As they can be entirely taken to pieces and folded in a small compass, they are very useful, and perfectly agree with the migratory life of these people, who are still ignorant of the use of carriages. The frame of these huts, and the felt they are covered with, though made as light as possible, yet are a suffi-cient load for a camel or two oxen. But the capacity of these huts, their warmth in winter, their strength in refifting tempetts and excluding rain, abundantly compenfate for this inconvenience. The wood endures many years; and though the felt begins to break into holes in the fecond year, the common people, who do not confider it as difgraceful to have them mended and patched, make them ferve a good deal longer. The huts are in general use from the prince down to the meanest Kalmuc, differing only in fize and in the embellishments within. In winter, they are warm even when heated with the dried excrements of their cattle. to which they are often obliged to have recourse for want of other combustibles in many places of the defarts which are deflitute of wood. In fummer they remove the felt to enjoy the fresh air.

The master of the tent has his bed placed opposite to the door behind the fire-place. The bedfleads are low and made of wood. The rich adorn their beds with curtains, and spread carpets of felt upon the ground. When a Kalmuc possesses an idol, he places it near the head of his bed, and fets before it feveral fmall confecrated cups full of water, milk, or other food. Before this fort of altar he fixes in the ground the trunk of a tree, on which he places a large iron basin destined to receive the libations of all the drink he makes use of in a day. On festivals the idol is decorated, the lamps are lighted, and perfumes burnt be-

The riches of the Kalmucs, and their whole means of fublistence, depend on their flocks, which many of them reckon by hundreds and even by tho. ands. man is thought capable of living on his possessions when he is mafter of ten cows with a bull, eight mares with a stallion. The animals they have in greatest abundance are horses, horned cattle, and sheep. Camels, which

Nº 171.

only the rich or the priests who possess any of them. Their horses are but small, too weak for the draught, and too wild; but they do not yield to any in fwiftpels, and support with ease the weight of a man. They may be made to gallop for feveral hours fucceffively without injury; and when necessity requires it, they can pass twice 24 hours without drinking. They have a little hoof, but very hard; and they may be used at all times without being shod. In this country the horses live and perpetuate themselves without any assidance from man. The Kalmucs castrate the greater part of their male foals, and at the same time slit their nostrils, that they may breathe more freely when they run. The fallions are never feparated from the mares. that there may always be plenty of milk. The stallions are leaders of the herd, and often wander at a diffance into the defarts at the head of their females, defending them from the wolves with the greatest intrepidity. The Kalmucs have the art of breaking a young horfe without using a bridle. They feize him before he is two years old by means of a noofe fixed to the end of a long pole; an inflrument they use in taking their riding horses which feed in the midst of the herd. They put no faddle at first on the colt they mean to break, but tie a firait girth round his body; by the help of which the horfeman can keep himfelf firm. When he is mounted, the horfe is abandoned to his fury : they allow him to run and agitate himfelf as much as he pleafes on the open plain till he is fatigued. The horfeman is folicitous only to keep himfelf faft : and when the horse begins to abate of his impetuosity, he nrges him again with the whip till his ftrength is almost gone : he is then faddled and bridled, and made to go for fome time at a moderate pace; after which

The horned cattle of the Kalmucs are of a beautiful Thape. They keep more bulls than are necessary for the cows, and employ a great number of them as beafts of burden for carrying their houses and their other furniture from place to place. They think a bull equal to 50 cows. Thefe and the mares give milk only while they fuckle their calves or their foals, which are accordingly kept close to the tents during the day, and only fuffered to fuck freely during the night; a practice which the Kalmucs pretend makes their cattle ftronger and more durable. They generally milk their mares three or four times a day, and for letimes every two hours when the herbage is abundant. The cows

are milked but twice a day.

The Kalmuc fleep are of the same species with those found in all Great Tartary, having large tails like a bag, exceedingly fat, and which furnish a fuet as foft as butter. They have also large pendant ears, and their head is much arched. Their wool is coarfe, and the cwes feldom have horns. One ram is sufficient for an hundred ewes. Little use is made of the milk. The wool is fit for nothing but to make felt for the tents. A great many theep die during winter, and a greater number still of the early lambs; the skins of which are wrought into those fine furs so much esteemed in Rusfia and foreign parts.

Camels belong only to the rich; for they are very dear, multiply very flowly, and are subject to many

Vol. IX. Part II.

Kalmues require time and pains to rear, cannot multiply much difeafes. The defarts of the Wolga, and almost all Kalmues. with them; they are befides too delicate; and it is those of the southern parts of Great Tartary, furnish excellent pasture for these animals; but they require not only much attention in winter, but they neaft be continually under the eye of the herdsmen; for notwithstanding the advantage of their stature, they are of all animals leaft able to defend themselves against the wolf. They are guarded with much care against the violence of the cold and the winds of winter: nevertheless many of them die of a confumption accompanied with a diarrhea, occasioned most probably by the moifture of their patture and of the feafon. This difeafe, for which no remedy has been found, makes them languish for fix months or more. They are in general fo delicate, that a flight wound or blow often prove fatal to them. Befides, no animal is fo much tormented with infects; and they often die in fummer of those they fwallow in eating the leaves of the oak and of the birch. The mela prascarabaus, which covers all the plants in many of those places where they feed, is generally fatal to them. In fpring, when they call their hair, and which falls at once from every part of their body, they are exposed to the bite of the spider scorpion, an animal very common in fouthern countries. The wound inflicted by this infect on the fkin thus naked is fo venomous, that the camel dies of it in less than eight days, fometimes in three. In winter, and especially after rutting time, which happens at the end of March, the camels become lean and weak; the bunch upon their back grows flabby, and hangs down upon the fide, nor does it recover its plumpness till fum-

Camels milk is thick, unctuous, and of a faltifb tafte, especially when the animals frequent pastures abounding with faline plants; and this last property makes the Kalmucs fond of it to tea. They make use of the hair for fluffing cushions, and for making ropes, packthread, and felt. It may be wrought into the most beautiful camlets, or into the finest and fostest cloths. The camels with two bunches are a very uneafy feat to the person who mounts them; their trot is fo heavy, and even their walk fo rude, that he receives

the most violent shocks at every step.

When a Kalmuc Horde intends to remove in fearch of fresh pasture, which in summer necessarily happens every four, fix, or eight days, people are in the first place dispatched to reconnoitre the best place for the khan or prince, for the lama, and for the huts containing the idols. These begin the march, and are followed by the whole troop, each choofing for himfelf the place he thinks most convenient. The camel that is loaded with the most precious furniture is decorated with little bells, the rest march in a string one behind another, and the bulls with burdens are driven on before. On these days the women and girls dress themfelves in their best clothes, and lay on abundance of paint. They have the charge, together with the boys, of leading the flocks and the beafts of burden; and on the road they beguile the tediousness of the journey with their fongs.

The Kalmucs are supplied by their flocks with milk. cheefe, butter, and flesh, which are the principal articles of their food. With regard to the laft, they are fo little squeamish, that they not only eat the flesh of their own discased cattle, but that of almost every fort Kalmucs of wild beaft, and the poor will even feed upon carion. cife of riding. Simple food, the free air which they Kamakura They eat, however, the roots and stalks of many plants; fuch as the bulbous rooted chervil and dandelion, &c.

which they use both boiled and raw.

Their ordinary drink is the milk of mares or cows; but the former is for feveral reasons preferred. This, when fresh, has indeed a very disagreeable taste of garlic: but befides that it is much thinner than cow-milk. it takes as it grows four a very agreeable vinous flavour; it yields neither cream nor curd, but furnishes a very wholefome refreshing beverage, which fensibly ine-briates when taken to excess. They never make use of new milk, and still less of milk or of water that have not been boiled. Their milk is boiled as foon as it is taken from the animal; when it is cold it is poured into a large leathern bag, in which there remains as much of the old milk as is fufficient to turn the new quantity four, for they never think of cleaning those bags; and as the infide is lined with a crust deposited by the caseous part of the milk and other impurities, it is easy to imagine that a nauseous finell must exhale from them. But this is precifely the circumstance in which the fecret confifts of communicating to the milk a vinous fermentation.

In fummer, and as often as the Kalmucs procure much milk from their flocks, they never fail to intoxicate themselves continually with the spirituous liquor which they know how to distil from it. Mares milk is the most spirituous; and the quantity meant to be distilled remains twenty-four hours in fummer, and three or four days in winter, in those corrupted bags we mentioned, to prepare it for the operation. The cream is left, but the butter which forms at top is taken off and referved for other purpofes. Cows milk yields one-thirtieth part, and mares milk one-fifteenth part, of spirit. This liquor is limpid and very watery, and confequently does not take fire, but is capable of being long kept in glass-bottles. The rich Kalmucs increase its strength by a second distillation.

These people are exceedingly fond of tea and tobac-The former is fo dear, as it comes to them from China by the way of Rushia, that the poor people fupply its place with various wild plants; fuch as a fpecies of liquorice, the feed of the sharp-leaved dock, the roots of wild angelica, and the feed of the Tarta-

rian maple.

The Kalmucs are excellent horsemen. Their arms are lances, bows, and arrows, poignards, and crooked fabres, though the rich have fire arms. They wear, when at war, coats of mail, which cost 50 horses, and their helmets are guilded at top. They are fond of falconry, and hunting of all forts is their principal amusement. Their passion for play, especially with those who play cards, is carried to as great excess among

them as in any other nation.

The greater part of their time is fpent in diversions; and however miserable their manner of life may feem to us, they are perfectly happy with it. They cannot endure for any time the air of a close room; and think our custom of living in houses insupportable. The greatest part of them, notwithstanding of the apparent unhealthiness of their way of life, arrive at a vigorous old age; their diseases are neither frequent nor dangerous. Men of 80 or 100 years old are not uncommon; and at that age they can ftill very well endure the exer-

conflantly breathe, a hardy vigorous conflitution, continual exercise without fevere labour, and a mind free from care, are the natural causes of their health and

longevity.

It is very remarkable, that a migratory people, whose manner of life feems fo congruous to the natural liberty of mankind, should have been subjected from time immemorial to the unlimited authority of an absolute sovereign. The Monguls of Afia afford the only inflance of it; for neither written records nor ancient tradition have preferved the fmallest trace of their ever having enjoyed a state of independence. On the contrary, they acknowledge that they have at all times been fubject to khans and princes, whose authority has been transmitted to them by succession, and is considered as a right perfectly established, sacred, and divine.

KAMAKURA, a famous island of Japan, about three miles in circumference, lying on the fouth coast of Niphon. It is here they confine their great men when they have committed any fauls. The coast of this island is so steep, that they are forced to be lifted

up by cranes.

KAMEEL, KAMEL, or Camel, a machine for lift-

ing ships. See CAMEL.

KAMINIECK, a very strong town of Poland, and capital of Podolia, with two caftles and a bishop's fee. It was taken by the Turks in 1672, who gave it back in 1600, after the treaty of Carlowitz. It is feated on a craggy rock, in E. Long. 27. 30. N. Lat.

KAMSIN, the name of a hot foutherly wind common in Egypt, of which we find the following description in Mr Volney's Travels .- These winds, favs he. are known in Egypt by the general name of winds of 50 days; not that they last 50 days without intermisfion, but because they prevail more frequently in the 50 days preceding and following the equinox. Travellers have mentioned them under the denomination of poisonous winds, or, more correctly, hot winds of the defart. Such in fact is their quality; and their heat is fometimes fo excessive, that it is difficult to form any idea of its violence without having experienced it; but it may be compared to the heat of a large oven at the moment of drawing out the bread. When these winds begin to blow, the atmosphere assumes an alarming aspect. The sky, at other times so clear in this climate, becomes dark and heavy; the fun loses his fplendor, and appears of a violet colour; the air is not cloudy, but grey and thick, and is in fact filled with an extremely fubtile dust, which penetrates every where. This wind, always light and rapid, is not at first remarkably hot, but it increases in heat in proportion as it continues. All animated bodies foon difcover it by the change it produces in them. The lungs, which a too rarefied air no longer expands, are contracted, and become painful. Respiration is short and difficult; the skin parched and dry, and the body confumed by an internal heat. In vain is recourse had to large draughts of water; nothing can reftore perspiration. In vain is coolness sought for; all bodies in which it is usual to find it deceive the hand that touches them. Marble, iron, water, notwithstanding the fun no longer appears, are hot. The streets are deserted, and the dead filence of night reigns every where.

Kamfin. The inhabitants of towns and villages shut themselves of the river Kovyma or Kolyma, lying in the frozen o Kamtchat-Kamtchat- up in their houses, and those of the defart in their tents or in wells dug in the earth, where they wait the termination of this destructive heat. It usually lasts three days, but if it exceeds that time it becomes infupportable. Wo to the traveller whom this wind furprifes remote from shelter; he must suffer all its horrible effects, which fometimes are mortal. danger is most imminent when it blows in fqualls; for then the rapidity of the wind increases the heat to such a degree as to cause fudden death. This death is a real fuffocation; the lungs being empty are convulfed, the circulation is difordered, and the whole mass of blood driven by the heart towards the head and breaft; whence the hæniorrhage at the nose and mouth which happens after death. This wind is especially destructive to perfons of a plethoric habit, and those in whom fatigue has descroyed the tone of the muscles and the veffels. The corple remains a long time warm, fwells, turns blue, and foon becomes putrid. These accidents are to be avoided by stopping the nose and mouth with handkerchiefs; an efficacious method likewife is that practifed by the camels. On this occasion these animals bury their nofes in the fand, and keep them there till the foughl is over. Another quality of this wind is its extreme aridity; which is fuch, that water fprinkled on the floor evaporates in a few minutes. By this extreme dryness it withers and flrips all the plants; and by exhaling too fuddenly the emanations from animal bodies, crifps the fkin, closes the pores, and causes that feverish heat which is the constant effect of suppressed perspiration.

KAMTCHATKA, KAMSCHATKA, or Kamchatka; a large peninfula on the north-eaftern part of Afia, lying between 51° and 62° of north latitude, and between 173° and 182° of east longitude from the isle of Ferro. It is bounded on the east and fouth by the fea of Kamtchatka, on the west by the seas of Ochotsk and Penshinsk, and on the north by the country of the

the Ruf-

This peninfula was not discovered by the Ruslians before the end of the last century. It is probable, however, that fome of that nation had visited Kamtchatka before the time above mentioned. For when Volodomir Atlassoff entered upon the conquest of this peninfula in 1697, he found that the inhabitants had already some knowledge of the Russians. A common tradition as yet prevails among them, that, long before the expedition of Atlasfoff, one Feodotoff and his companions had refided among them, and had intermarried with the natives; and they ftill show the place where the Russian habitations stood. None of the Ruffians remained when Atlaffoff first visited Kamtchatka. They are faid to have been held in great veneration, and almost deified by the natives; who at first imagined that no human power could hurt them, until they quarrelled among themselves, and the blood was feen to flow from the wounds which they gave each other; and foon after, upon a feparation taking place, they were all killed by the natives. -These Russians were thought to be the remains of a ship's crew who had sailed quite round the northeaftern promontory of Asia called Tschukutskoi-Noss. The account we have of this voyage is as tollows .-

In 1648, feven kotches or veffels failed from the mouth

cean in about 720 north latitude, and 1730 or 1740 eaft ka. longitude from Ferro, in order to penetrate into the eaftern ocean. Four of these were never more heard of; the remaining three were commanded by Simon Deshneff, Gerasim Ankudinosf, two chiess of the Coffacs, and Feodotoff Alexeeff, head of the Promythles nics or wandering Ruffians, who occasionally visited Siberia. Each veffel was probably manned with about 30 perfons. They met with no obstructions from the ice; but Ankudinoff's veffel was wrecked on the promontory above mentioned, and the crew were distributed on board the two remaining vessels. These two soon after lost fight of each other, and never afterwards rejoined. Deshness was driven about by tempestuous winds till October, when he was shipwrecked on the northern part of Kamtchatka. Here he was informed by a woman of Yakutsk, that Feodotoff and Gerasim had died of the scurvy; that part of the crew had been flain; and that a few had efcaped in fmall veffels, who had never afterwards been heard of; and these were probably the people who, as we have already mentioned, fettled among the Kamtchatkans.

As the inhabitants of this country were neither nu. Subdued by merous nor warlike, it required no great force to fub-them. due them; and in 1711 the whole peninfula was finally reduced under the dominion of the Ruffians .-For fome years this acquifition was of very little confequence to the crown, excepting the fmall tribute of furs exacted from the inhabitants. The Ruffians indeed occasionally hunted, in this peninfula, foxes, wolves, ermines, fables, and other animals, whose skins form an extensive article of commerce among the eaftern nations. But the fur-trade carried on from thence was very inconsiderable, until the series of islands mentioned in the next article 'were discovered; fince which time the quantities of furs brought from these islands have greatly increased the trade of Kamtchatka, and rendered it an important part of the Ruffian commerce.

The face of the country throughout the peninfula Country is chiefly mountainous. It produces in some parts described; birch, poplars, elders, willows, underwood, and berries of different forts. Greens and other vegetables are raifed with great facility; fuch as white cabbage, turnips, radifies, beet-root, carrots, and fome cucumbers. Agriculture is in a very low state, owing chiefly to the nature of the foil and the fevere hoarfrosts; for though fome trials have been made with respect to the cultivation of grain, and oats, barley, and rye, have been fown, yet no crop has ever been procured fufficient in quantity or quality to answer the trouble of raising it. Hemp, however, has of late years been cultivated with great fuccefs .- Every year a vessel belonging to the crown fails from Ochotsk to Kamtchatka laden with falt, provisions, corn, and Russian manufactures; and returns in June or July of the following year with skins and furs.

Many traces of volcanoes have been observed in this Volcanoes. peninfula; and there are fome mountains which are in a burning flate at prefent. The most considerable of these is situated near the middle of the peninsula, In 1762, a great noise was heard issuing from the infide of that mountain, and flames of fire were feen to

3 H 2

Kamtchat- burft from different parts. These stames were imme- gal Chinese language, as their terminations in ong Kantchate diately succeeded by a large stream of melted snowdrowned two natives who were there on a hunting party. The ashes and burning matters thrown from the mountain were spread over a surface of 300 verits. In 1767 was another discharge, but less considerable. Every night flames of fire were observed ftreaming from the mountain; and confiderable damage was done by the eruption which attended them. Since that year no flames have been feen; but the mountain emits a constant (make.

Manners.

matives.

&c. of the

Kamtchatka is divided by the Russians into four diftricts; and the government of the whole is dependent upon, and subject to, the inspection of the chancery of Ochotsk. The whole Russian force stationed in this peninfula amounts to no more than 300 men. present population of Kamtchatka is very small, amounting to fcarce 4000 fouls. Formerly the inhabitants were more numerous; but in 1768, the fmallpox carried off 5368 persons. There are now only about 700 males in the whole peninfina who are tributary, and few more than 100 in the neighbouring islands, called the Kuril Isles, who are subject to Russia. The fixed annual tribute confifts in 279 fables, 464 red foxes, 50 fea-otters with a dam, and 38 cub otters. All furs exported from Kamtchatka pay a duty of 10 per cent. to the crown; the tenth part of the cargoes bought from the neighbouring islands is also delivered into the customs.

The natives of Kamtchatka are as wild as the country itself. Some of them have no fixed habitations, but wander from place to place with their herds of rein-deer; others have fettled habitations, and refide upon the banks of the rivers and the shore of the Penschinska sea, living upon fish and sea-animals, and fuch herbs as grow upon the shore: the former dwell in huts covered with decr-fkins; the latter in places dug out of the earth; both in a very barbarous manner. Their dispositions and tempers are rough; and they are entirely ignorant of letters or religion. The natives are divided into three different people, namely, the Kamtchatkans, Koreki, and Kuriles. The Kamtchatkans live upon the fouth fide of the promontory of Kamtehatka: the Koreki inhabit the northern parts on the coast of the Penchinska sea, and round the eastern ocean almost to the river Anadir, whose mouth lies in that ocean almost in 68° N. Lat.: the Kuriles inhabit the islands in that sea, reaching as far as those of Japan. The Kamtchatkans have this particular cuftom, that they endeavour to give every thing a name in their language which may express the property of it; but if they do not understand the thing quite well themselves, then they take a name from fome foreign language, which perhaps has no relation to the thing itself; as, for example, they call a priest bogbog, because probably they hear him use the word borbog, "God;" bread they call brightatin aug fb, that is, Ruffian root; and thus of feveral other words to which their language is a stranger.

It appears probable, that the Kamtchatkans lived formerly in Mungalia beyond the river Amur, and made one people with the Mungals; which is farther confirmed by the following observations, such as the Kamtchatkan having feveral words common to the Mun-

ing, oang, chin, char ching, khii, khung; it would water, which flowed into the neighbouring valley, and be still a greater proof; if we could show several words and fentences the fame in both languages. The Kamtchatkans and Mungals also are both of a middling stature, are fwarthy, have black hair, a broad face, a fharp nofe, with the eyes failing in, eye-brows small and thin, a hanging belly, flender less and arms; they, are both remarkable for cowardice, boaking, and flavifhness, to people who use them hard, and for their oblinacy and contempt of those who treat them with gentlenefs.

M

Although in outward appearance they refemble the other inhabitants of Siberia, yet the Kamtchatkans differ in this, that their faces are not fo long as the other Siberians; their cheeks stand more out, their teeth are thick, their mouth large, their flature middling, and their shoulders broad, particularly those

people who inhabit the fea-coaft.

Before the Ruffian conquest, they lived in perfect freedom, having no chief, being subject to no law, nor paying any taxes; the old men, or those who were remarkable for their bravery, bearing the principal authority in their villages, though none had any right to

command or inflict punishment.

Their manner of living is flovenly to the last degree: they never wash their hands nor face, nor cut their nails; they eat out of the same dish with the dogs, which they never wash; they never comb their heads, but both men and women plait their hair in two locks, binding the ends with small ropes. When any hair flarts out, they few it with threads to make it lie close; by this means they have such a quantity of lice, that they can ferape them off by handfuls, and they are nafty anarch even to eat them. Those that have not p air fufficient, wear false locks, sometimes as much pounds, which makes their

heads look like a naveock.

They place their chief happiness in idleness, and fatisfying their natural lust and appetites; which incline them to finging, dancing, and relating of love-stories; and they think it more eligible to die than to lead a difagreeable life; which opiniou often leads them to felf-murder. This was fo common after the con- Kamtchate quest, that the Russians had great difficulty to put a kans incliftop to it. They have no notion of riches, fame, or ned to less honour; therefore covetoulnels, ambition, and pride, murder. are unknown among them. On the other hand, they are careless, luftful, and cruel: these vices occasion frequent quarrels and wars among them, fometimes with their neighbours, not from a defire of increasing their power, but from some other causes; such as the carrying off their provisions, or rather their girls, which is frequently practifed as the most summary method of procuring a wife. Their trade is almost entirely confined to procuring the immediate necessaries and conveniences of life. They fell the Koreki fables, fox and white dog-skins, dried mushrooms, and the like, in exchange for cloaths made of deer-skins and other hides. Their domestic trade confists in dogs, boats, diffies, troughs, nets, hemp, yarn, and provifions: and this kind of barter is carried on under a great show of friendship; for when one wants any thing that another has, he goes freely to vifit him, and without any ceremony makes known his wants, al-

Kamtchat- though perhaps he never had any acquaintance with him before : the hoft is obliged to behave according to the custom of the country, and give his guest what he has occasion for; but he may afterwards return the visit, and must be received in the same manner. They fill almost every place in heaven and earth with different fairits, and offer them facrifices upon every occafion. Some carry little idols about them, or have them placed in their dwellings; but with regard to God, they not only neglect to worship him, but in case of troubles and misfortunes they curfe and blafplieme

number aty.

It is very diverting to fee them attempt to reckon above ten: for having reckoned the fingers of both bove twen- hands, they clasp them together, which fignifies ten; then they begin with their toes, and count to twenty ; after which they are quite confounded, and cry, Metcha? that is, Where shall I take more? They reckon ten months in the year, fome of which are longer and fome fhorter; for they do not divide them by the changes of the moon, but by the order of particular occurrences that happen in those regions. They commonly divide our year into two, fo that winter is one year and fummer another: the fummer year begins in May, and the winter in November. They do not diftinguish the days by any particular appellation, nor form them into weeks or months, nor yet know how many days are in the month or year. They mark their epochs by fome remarkable thing or other; fuch as the arrival of the Russians, or the first expedition to Kamtchatka.

If any one kills another, he is to be killed by the relations of the person slain. They burn the hands of people who have been frequently caught in thefe; but for the first offence the thief must restore what he hath stolen, and live alone in folitude, without expecting the affiftance of others. They never have any difputes about their land or their huts, every one having land and water more than fufficient for his wants. They think themselves the happiest people in the world, and look upon the Ruffians who are fettled among them with contempt. However, this notion begins to change; for the old people who are confirmed in their cuftoms drop off; and the young ones being converted to the Christian religion, adopt the customs of the Ruffians, and despife the barbarity and superstition of their ancestors.

In every oftrog or large village, by order of her imperial majefty, is appointed a chief, who is fole judge in all causes except those of life and death ; and not only those chiefs, but even the common people, have their chapels for worthip. Schools are also erected in almost every village, to which the Kamtchatkans fend their children with great pleasure : by this means it is to be hoped that barbarity will be in a

fhort time rooted out from amongst them.

Under the name of oftrog, is understood every habitation confilling of one or more huts, all furrounded by an earthen wall or palifado .- The huts are built in the following manner: they dig a hole in the earth their huts. about five feet deep, the breadth and length proportioned to the number of people defigned to live in it. In the middle of this hole they plant four thick wooden pillars; over thefe they lay balks, upon which

they form the roof or ceiling, leaving in the middle a Kamtchitfquare opening which ferves them for a window and chimney; this they cover with grafs and earth, fo that the outward appearance is like a round hillock; but within they are an oblong square, with the fire in one of the long sides of the square: between the pillars round the walls of their huts they make benches, upon which each family lies feparately; but on that fide oppolite to the fire there are no benches, it being defigned for their kitchen furniture. in which they drefs their victuals for themselves and dogs. In those huts where there are no benches, there

are balks laid upon the floor, and covered with mats. They adorn the walls of their huts with mats made of grafs. They enter their huts by ladders, commonly placed near the fire-hearth; fo that, when they are heating their huts, the fleps of the ladder become for hot, and the fmoke fo thick, that it is almost imposfible for a ftranger to go up or down without being burnt, and even stifled to death; but the natives find no difficulty in it; and though they can only fix their toes on the steps of the ladder, they mount like squirrels; nor do the women hefitate to go through this fmoke with their children upon their fhoulders, though there is another opening through which the women are allowed to pass; but if any man pretend to do the fame, he would be laughed at. The Kamtchatkans live in these huts all the winter, after which they go into others called balagans: thefe ferve them not only to live in during the fummer, but also for magazines. They are made in the following manner: nine pillars, about two fathoms long, or more, are fixed in the ground, and bound together with balks laid over them, which they cover with rods, and over all lav grafs, fastening spars, and a round sharp roof at top, which they cover with bramble, and thatch with grass. They falten the lower ends of the fpars to the balks with ropes and thongs, and have a door on each fide, one directly opposite to the other. They make use of the fame kind of huts to keep their fish, &c. till winter comes on, when they can more eafily remove it; and this without any guard, only taking away the ladders. If these buildings were not so high, the wild bealts would undoubtedly plunder them; for notwithstanding all their precaution, the bears fometimes climb up and force their way into their magazines, especially in the harvest, when the fish and berries begin to grow

The fouthern Kamtchatkans commonly build their villages in thick woods and other places which are naturally strong, not less than 20 versts from the sea; and their fummer habitations are near the mouths of the rivers; but those who live upon the Penschinska fea and the eaftern ocean build their villages very near the shore. They look upon that river near which their village is fituated as the inheritance of their

In order to kindle fire, they use a board of dry Method of wood with round holes in the fides of it, and a small kindling round flick; this they rub in a hole till it takes fire . fire. and instead of tinder they use dry grass beat fost, These instruments are held in such esteem by the Kamtchatkans, that they are never without them, and they value them more than our fleels and flints; but they

Manner of building

Kamtchat- are exceffively fond of iron instruments, such as hatchets, knives, or needles; nav, at the first arrival of the Russians, a piece of broken iron was looked upon as a great prefent; and even now they receive it with thankfulness, finding use for the least fragment, either to point their arrows or make darts, which they do by hammering it out cold between two stones. As fome of them delight in war, the Russian merchants are forhid to fell them any warlike inftruments; but they are ingenious enough to make spears and arrows out of the iron pots and kettles which they buy; and they are fo dexterous, when the eye of a needle breaks, as to make a new eye, which they will repeat until nothing remains but the point.

Conftruction of

The Kamtchatkans make their boats of poplarwood; but the Kuriles not having any wood of their sheir boats. own, make use of what is thrown on shore by the sea, and is supposed to come from the coasts of Japan, China, or America. The northern inhabitants of Kamtchatka, the fettled Koreki and Tschukotskoi, for want of proper timber and plank, make their boats of the skins of sea-animals. They sew the pieces together with whales beards, and caulk them with mofs or nettles beat fmall. These boats hold two persons; one of which fits in the prow, and the other in the stern. They push them against the stream with poles, which is attended with great trouble: when the current is strong, they can scarcely advance two feet in ten minutes; notwithstanding which, they will carry these boats, fully loaded fometimes 20 verits, and when the stream is not very strong, even 30 or 40 verits. The larger boats carry 30 or 40 pood; when the goods are not very heavy, they lay them upon a float or bridge refting upon two boats joined toge-ther. They use this method in transporting their provisions down the stream, and also to and from the iflands

Their cloaths for the most part are made of the skins of deer, dogs, feveral fea and land animals, and even of the skins of birds, those of different animals being frequently joined in the same garment. They make the upper garment after two fashions; fometimes cutting the skirts all of an equal length, and fometimes leaving them long behind in form of a train, with wide fleeves of a length to come down below the knee, and a hood or caul behind, which in bad weather they put over their heads below their caps; the opening above is only large enough to let their heads pass: they sew the skins of dogs feet round this opening, with which they cover their faces in cold flormy weather; and round their skirts and sleeves they put a border of white dog-skin ; upon their backs they sew the small shreds of skins of different colours. They commonly wear two coats; the under coat swith the hair-fide inwards, the other fide being dyed with alder; and the upper with the hair outwards. For the upper garment they choose black, white, or speckled Ikins, the hair of which is most esteemed for the beauty of its colour.

Men and women without distinction use the abovementioned garments, their drefs only differing in their under-cloathing and in the covering of their feet and legs. The women have an under-garment, which they commonly wear at home in the house, confisting of a breeches and waiftcoat fewed together. The breeches

are wide like those of the Dutch skippers, and tie be-Kamtchatlow the knee; the waiftcoat is wide above, and drawn round with a string. The fummer habits are made of dreffed skins without hair: their winter-garment is made of deer or stone-ram skins with the hair on, The undress or household habit of the men is a girdle of leather with a bag before, and likewife a leathern apron to cover them behind; thefe girdles are fewed with hair of different colours. The Kamtchatkans used formerly to go a hunting and fishing during the fummer in this drefs; but now this fashion is changed. and they wear linen fhirts, which they buy from the

The covering of their feet and legs is made of fking of different forts: in the fummer-time, during the rains they wear the skins of seal with the hair outwards; but their most common covering is the skin of the legs of the rein-deer, and fometimes of the legs of other beafts, the shaggiest they can find, to preserve them against the cold. But the buskins which both the Cossacs and Kamtchatkans use in their finest dress, are made in the following manner: the fole is of white feal skin, the upper part of white fine leather, the hind quarters of white dog skin; what comes round the legs is of dressed leather or dyed seal-skin; the upper parts are embroidered. These buskins are so extraordinary, that if a bachelor is observed to wear them. he is immediately concluded to be upon a scheme of courtship.

They wear the fame fort of caps as the people of Yakutíki. In fummer they have a fort of hats of birch bark tied about their head. The Kuriles use in the fummer-time caps made of plaited grass. The womens head dress is the perukes that we formerly mentioned; and thefe were fo dear to them, that when they came to be Christians they were with difficulty prevailed upon to quit this dress for one more decent : however, at present, round the Russ settlements, all is entirely changed, the women wearing shirts, ruffles, waistcoats, caps, and ribbands; which change nobody now complains of except the very old people. The women do all their work in mittins; they formerly never washed their faces, but now they use both white and red paint : for white paint they make use of a rotten wood; and for red a fea plant, which they boil in feal's fat, and rubbing their cheeks with it, make them very red. They dress most in the winter time, especially when they either receive or pay vifits.

The common cloaths for a Kamtchatkan and his family will not cost him less than 100 rubbles; for the coarfest worsted stockings, which cost in Russia 20 kopeeks, cannot be bought here for less than a ruble ; and all other things are fold in the same proportion. The Kuriles are more able to buy good cloaths than the Kamtchatkans; for they can purchase for one seabeaver as much as the Kamtchatkans can for twenty foxes; and one beaver costs the Kuriles no more trouble than five foxes do the Kamtchatkans; for he must be a good hunter who catches more than ten foxes in the winter; and a Kurile thinks himself unlucky if he doth not catch three beavers in the feafon; befides which, great numbers are thrown upon the shore by

The Kamtchatkans divide their fish into fix parts : Their dieta the fides and tail are hung up to dry; the back and

Of their slothes.

nerally dried over the fire; the head is laid to four in pits, and then they eat it like falt fish, and esteem it much, though the flink is fuch that a stranger cannot bear it; the ribs and the flesh which remain upon them they hang up and dry, and afterwards pound for use; the larger bones they likewife dry for food for their dogs : in this manner all these different people prepare the yokola, which is the principal food, or, one may fay, household bread; and they eat it for the most part

Their fecond favourite food is caviar, or the roes of fish, which they prepare three different ways. They dry the roe whole in the air; or take it out of the fkin which invelopes it, and spreading it upon a bed of grafs, dry it before the fire; or, laftly, make rolls of it with the leaves of grass, which they also dry. They never take a journey or go to hunting without dry caviar; and if a Kamtchatkan has a pound of this, he can subsist without any other provision a great while: for every birch and alder tree furnishes him with bark, which with his dried caviar makes him an agreeable meal; but they cannot eat either feparately, for the caviar sticks like glue to the teeth ; and it is almost impossible to swallow the bark, chewed ever fo long by itself. There is still a fourth method, which both Kamtchatkans and Koreki use in preparing their caviar: the first having covered the bottom of a pit with grass, they throw the fresh caviar into it, and leave it there to grow four : the Koreki tie theirs in bags, and leave it to four; this is efteemed their most delicate dish.

There is a third fort of diet, called by the Kamtchatkans chupriki, which is prepared in this manner: in their huts, over the fire-place, they make a bridge of stakes, upon which they lay a heap of fish, which remains there until the hut becomes as warm as a bagnio. If there is no great thickness of fish, one fire ferves to dress it; but sometimes they are obliged to make two, three, or more fires. Fifh dreffed in this manner is half roafted, half smoaked, but has a very agreeable tafte, and may be reckoned the best of all the Kamtchatkan cookery: for the whole juice and fat is prepared with a gradual heat, and kept in by the Ikin, from which they may when done enough be eafily separated; and as soon as it is thus dressed, they take out the guts, and fpread the body upon a mat to dry : this they afterwards break small, and putting it into bags, carry it along with them for provifion, eating it like the yokola.

The Kamtchatkans have a dish which they esteem very much, called buigul: it is fift laid to grow four in pits; and though the fmell of it is intolerable, yet the Kamtchatkans efteem it a perfume. This fifth fometimes rots fo much in the pits, that they cannot take it out without ladles; in which case indeed they use it for feeding their dogs.

As for the flesh of land and the larger sea animals, they boil it in their troughs with several different herbs and roots; the broth they drink out of ladles and bowls, and the meat they take out upon boards, and eat in their hands. The whale and fea-horfe fat they also boil with roots.

Kamtchat- thinner part of the belly are prepared apart, and ge- tertainments, called felaga, which they make by pound. Kamtchating all forts of different roots and berries, with the addition of caviar, and whale and feal's fat.

Before the conquest, they feldom used any thing for drink but plain water, unless when they made merry; then they drank water which had flood fome time upon mushrooms. At prefent they drink spirits as fast as the Russians. After dinner they drink water: and when they go to bed at night, fet a veffel of water by them, with the addition of fnow or ice to keep it cold, and always drink it up before morning. In the winter-time, they amuse themselves frequently by throwing handfuls of fnow into their mouths; and the bridegrooms, who work with the fathers of their future brides, find it their hardest task to provide snow for the family in fummer-time; for they must bring it from the highest hills be the weather what it will. otherwife they would never be forgiven.

The Kamtchatkans commonly travel in fledges Method of

drawn by dogs. The animals used for this purpose travelling differ very little from the common house-dogs; they with dogs are of a middling fize, of various colours, though there feem to be more white, black, and grey, than of any other. In travelling, they make use of those that are caltrated, and generally yoke four to a fledge. They drive and direct their dogs with a crooked flick about four feet long, which they sometimes adorn with different coloured thongs; this is looked upon as a great piece of finery. They drive their fledge fitting upon their right fide, with their feet hanging down; for it would be looked upon as a difgrace for a man to fit down at the bottom of the fledge, or to make use of any person to drive him, nobody doing this but the women. It is very difficult to travel in these sledges; for unless a man keeps the exactest balance, he is liable every moment from the height and narrowness of them to be overturned: in a rugged road this would be very dangerous, as the dogs never ftop till they come to fome house, or are entangled by something upon the road; especially in going down steep hills, when they run with all their force, and are fearcely to be kept in; for which reason, in descending any great declivity, they unyoke all the dogs except one, and lead them foftly down. They likewife walk up hills; for it is as much as the dogs can do to drag up the sledge empty. After a deep fnow, be-fore it has been hardened by a frost, there is no travelling with dogs till a road be made, which is effected by a man going before upon fnow fnoes, whom they call brodovskika. The snow-shoes are made of two thin boards, separated in the middle, bound together at the ends, and with the fore part bent a little upwards. The brodovshika, having one of these shoes upon each foot, leaves the dogs and sledge, and going on clears the road for fome way; then returning, leads forward the dogs and fledge fo far as the road is made; a method which he must continue till he comes to some dwelling-house. This is very laborious; and it happens fo often, that no driver ever fets out without his fnow-shoes. When a storm of driven fnow furprises them, they are obliged with all haste to . feek the shelter of some wood, and stay there as long as the tempest lasts, which sometimes is a whole week. There is a principal dish at all their feasts and en- If they are a large company, they dig a place for themselves

Kantchat themselves under the snow, and cover the entry with which is known to the Russians. It is washed up by the Kantchate wood or brambles. Sometimes they hide themselves in caves or holes of the earth, wrapping themselves up in their furs; and when thus covered, they move or turn themselves with the greatest caution lest they should throw off the snow, for under that they lie as warm as in their common huts : they only require a breathing place; but their cloaths must not be tight or hard girt about them, for then the cold is infufferable. Another danger attending travellers is, that in the feverest frost feveral rivers are not quite frozen over : and as the roads for the most part lie close upon the rivers, the banks being very fleep, scarce a year paffes without many being drowned. A difagreeable circumstance also to those who travel in these parts, is their fometimes being obliged to pass through copfes, where they run the rilk of having their eyes feratched out or their limbs broken; for the dogs always run most violently in the worst roads, and, to free themfelves, very often overturn their driver. The best travelling is in the month of March or April, when the fnow is turned hard or frozen a little at top; however, there is full this inconvenience attending it, that fometimes travellers are obliged to lodge two or three nights in defert places; and it is difficult to prevail upon the Kamtchatkans to make a fire cither for warming themselves or dreffing victuals, as they and their dogs eat dried fish, and find themselves fo · warm wrapped in their furs, that they want no other heat; nay, all the people of this climate bear cold fo well, that they fleep in the open air as found as others in a warm bed, and awake next morning perfectly refreshed and alert. This feems to be so natural to all here, that fome of them have been feen to lie down with their backs uncovered against a fire, and not withstanding the fire has been burnt out long before morning, they continued to fleep on very comfortably, and without any inconvenience.

Islands in the Sea of KAMTCHATKA. So many of these have been discovered by the Russians, that the existence of almost a continued chain of islands between the continents of Asia and America is now rendered extremely probable. Many further difcoveries of great importance to fcience, however, remain yet to be made. The principal islands already known are the Kuril isles, which firetch fouthwest towards the coasts of China or Japan, and are almost uninhabited; those called Beering's, and Copper islands, the Aleutian isles, and Foxislands, or Lyfie Ofrova, lie almost directly east, fretching nearly to 230° of longitude east from Ferro. The first project of making discoveries in that tempestuous fea which lies between Kamtchatka and America was fet on foot by Peter the Great of Russia. Captains Beering and Tschirikoff were employed in the undertaking; the former of whom was shipwrecked and died on the island which is still called by his name. As this lies at no great distance from Kamtchatka, the inhabitants of the latter foon ventured over to it, as the feaotters and other animals of that kind were accustomed

to refort thither in great numbers. Mednoi Oftroff, or Copper-ifland, which lies in full fight of Beering's island, was next visited. This island has its name from the great quantity of copper with

Nº 171.

fea, and covers the shores in such abundance that many ships might be loaded with it. Perhaps an India trader might make a profitable voyage from thence to China, where this metal is in high demand. This copper is mostly in a metallic or malleable state, and many pieces feem as if they had formerly been in fufion. The island is not high; but has many hillocks, each of which has the appearance of having formerly been a volcano. With this kind of hillocks all the illands in the fea of Kamtchatka abound, infomuch that not a fingle island, though ever fo fmall, was found without one; and many of them confifted of nothing elfe. In fhort, all the chain of islands above mentioned may without any firetch of imagination be confidered as thrown up by fome late volcanoes. The apparent nowelty of every thing feems to justify this conjecture : nor can any objection be derived from the vegetable productions with which thefe islands abound; for the fummer after the lower diftrict of Zutphen in Holland was gained from the fea, it was covered over with wild mustard .- All these islands are subject to frequent and violent earthquakes, and abound in fulphur. We are not informed whether any lava is found upon them; but a party-coloured ftone as heavy as iron. probably a lava, is mentioned as being found there. From this account it is by no means improbable that the copper above mentioned has been melted in fome eruption.

Beering's island is fituated due east from Kamtchat-Beering's ka, in the 185th degree of longitude; and Copper-island the Aleuabout one degree more to the eastward, and in the la tian illes. titude of 54° north. The former is from 70 to 80 versts long, and stretches from north-west to south-east in the fame direction as Copper-island. The latter is about 50 versts in length. About 300 versts east-byfouth of Copper-island lie the Aleutian isles; of which Attak is the nearest: it is rather larger than Beering's island, and stretches from west to sonth-east. From thence about 20 versts eastwards is fituated Semitshi, extending from west to east; and near its extremity is another small island. To the fouth of the strait which feparates the two latter islands, and at the diltance of 40 versts from both of them, lies Shimiya in a fimilar position, and not above 25 verils in length. All these islands lie between 54 and 55 degrees of north lati-

The Fox islands are fituated east-north-east from the Fox islands, Aleutians: the nearest of these, Atchak, is about 800 versts distant; it lies in 56° north latitude, and extends from west-fouth west, towards east-north-east. It greatly refembles Copper-island, and is provided with a commodious harbour on the north. From thence all the other islands of this chain stretch in a direction towards north-east by east. The next to Atchak is Amlak, and about 15 versts distant : it is nearly of the fame fize, and has an harbour on its fouth fide. Next follows Saugagamak, at about the fame diffance, but fomewhat smaller; from thence is 50 versts to Amuchta, a fmall rocky island; and the latter to Yunaksan, another fmall island. About 20 versts from Yunaksan there i a cluster of five fmall islands, or rather mountains, Kigalgift, Kagamila, Tfigulac, Ulaga, and Tawhich the north east coast of it abounds, the only fide na Unok; and which are therefore called by the Ruf-

Copper

Kamtchat fians Pat Sopki, or the Five Mountains. Of thefe Tana Unok lies most to the north-east, towards which the western point of Umnak advances within the di-

flance of 20 verits.

Umnak stretches from fouth-west to north-east; it is 150 verfts in length, and has a very confiderable bay on the west end of the northern coast, in which there is a small island, or rock, called Adugak; and on the fouth fide Shemalga, another rock. The western point of Aghunalashka, or Unalashka, is separated from the east end of Umnak by a strait near 20 versts in breadth. The position of these two islands is similar ; but Aghunalashka is much the largest, and is above 200 verfts long. It is divided towards the northeast into three promontories, one of which runs out in a westerly direction, forming one side of a large bay on the north coast of the island : the second stretches out north-east, ends in three points, and is connected with the island by a small neck of land. The third, or most foutherly one, is separated from the last-mentioned promontory by a deep bay. Near Unalashka towards the east lies another small island called Shirkin. About 20 verils from the north-east promontory of Aghunalashka lie four islands: the first, Akutan, is about half as big as Umnak; a verit further is the fmall island Akun; a little beyond is Akunok; and laftly, Kigalga, which is the smallest of these four; and firetches with Akun and Akunok almost from north to Kigalga is fituated about the 61st degree of latitude. About 100 versts from thence lies an island called Unimak, upon which a Russian navigator (Captain Krenitzin) wintered; and beyond it the inhabitants faid there was a large tract of country called Alaska, of which they did not know the boundaries.

The Fox-islands are in general very rocky, without containing any remarkably high mountains: they are destitute of wood; but abound in rivulets and lakes, which are mostly without fish. The winter is much milder than in Siberia; the fnow feldom falls before the beginning of January, and continues on the ground till the end of March. There is a volcano in Amuchta, and fulphur is produced on another island; in some others are fprings hot enough to boil provisions. Sulphureous flames also are fometimes feen at night upon

the mountains of Unalashka and Akutan.

The Fox-islands are tolerably populous in proportion to their fize. The inhabitants are entirely free, and anhabitants. pay tribute to no one; they are of a middle stature, and live, both in fummer and winter, in holes dug in the earth. No figns of religion were found among them. Several persons indeed pass for forcerers, pretending to know things past and to come; and are accordingly held in high efteem, but without receiving any emolument. Filial duty and respect towards the aged are not held in estimation by these islanders. They are not, however, deficient in fidelity towards each other; they are of a lively and cheerful temper. though rather impetuous, and naturally prone to anger. In general, they do not observe any rules of decency; but follow all the calls of nature publicly and without the least referve. Their principal food confifts in fifh, and other fea-animals, small shell-fish, and fea-plants; their greatest delicacies are wild lilies and You. IX. Part II.

other roots, together with different kinds of berries, Kamtchat-When they have laid in a store of provisions, they eat at any time of the day without distinction; but in case of necessity, they are capable of fasting several days together. They feldom heat their dwellings : but when they are defirous of warming themselves, they light a bundle of hay, and stand over it; or else they fet fire to train-oil, which they pour into a hollow ftone. They feed their children when very young with the coarfest flesh, and for the most part raw. If an infant cries, the mother immediately carries it to the fea-fide, and, be it fummer or winter, holds it na-ked in the water until it is quiet. This custom, it is faid, is fo far from doing the children any harm, that it hardens them against the cold; and accordingly they go barefooted through the winter without the least inconvenience. They are also trained to bathe frequently in the fea; and it is an opinion generally received among the islanders, that by these means they are rendered bold and fortunate in fishing.

The men wear shirts made of the skins of cormorants, fea divers, and gulls; and in order to keep out the rain, they have upper garments of the bladders and other intestines of fea-lions, fea-calves, and whales, blown up and dried. They cut their hair in a circular form quite close to their ears; and shave also a round place on the top. The women, on the contrary, let the hair descend over the forehead as low as the eyebrows, and tie the remaining part in a knot upon the top of the head. They pierce the ears, and hang in then bits of coral, which they get from the Ruffians. Both fexes make holes in the griftles of their nofes, and in the under-lips, in which they thrust pieces of bone, and are very fond of fuch kind of ornaments. They mark also and colour their faces with different figures. They barter among one another fea-otters. fea bears, clothes made of birds skins and of dried intestines, skins of sea-lions and sea-calves for the coverings of their canoes, wooden masks, darts, thread made of finews and hair of reindeer.

Their household utenfils are square pitchers and large troughs, which they make out of the wood driven ashore by the sea. Their weapons are bows and arrows pointed with flint, and javelins of two yards in length, which they throw from a fmall board. Inflead of hatchets, they use crooked knives of flint or bone. Some iron knives, hatchets, and lances, were observed among them, which they had probably got by plun-

dering the Ruffians.

According to the reports of the oldest inhabitants of Umnak and Unalashka, they have never been engaged in any war, either amongst themselves or with their neighbours, except with the people of Alashka, the occasion of which was as follows. The fon of the toigon or chief of Umnak had a maimed hand; and some inhabitants of Alashka, who came to visit upon that island, fastened to his arm a drum, out of mockkery, and invited him to dance. The parents and relations of the boy were offended at this infult : hence a quarrel enfued; and from that time the people have lived in continual enmity, attacking and plundering each other by turns. According to the reports of the islanders, there are mountains upon Alashka, and woods of great extent at some distance from the coast. The na-3 I

&c. of the

Kaolin.

Kamtchat-tives wear clothes made of the fkins of reindeer, wolves. and foxes: and are not tributary to any of their neighbours. The inhabitants of the Fox-islands feem to have no knowledge of any country beyond Alashka, which is one of the most easterly islands yet discovered in these seas, and is probably not far distant from the

continent of America.

Feafts are very common among thefe illanders; and more particularly when the inhabitants of one island are vifited by those of the others. The men of the village meet their guests, beating drums, and preceded by the women who fing and dance. At the conclusion of the dance, the hofts invite them to partake of the feaffs; after which ceremony, the former return first to their dwellings, place mats in order, and ferve up their beilt provision. The guests next enter, take their places, and, after they are fatisfied, the diversions begin. First, the children dance and caper, at the same time making a noise with their small drums, while the owners of the huts of both fexes fing. Next, the men dance almost naked, tripping after one another, and beating drums of a larger fize: when these are weary, they are relieved by the women, who dance in their clothes, the men continuing in the mean time to fing and beat their drums. At last the fire is put out which had been kindled for the ceremony. The manner of obtaining fire is by rubbing two pieces of dry wood against each other, or most commonly by striking two flints together, and letting the sparks fall upon some sea-otter's hair mixed with fulphur. If any forcerer is prefent, it is then his turn to play his tricks in the dark; if not, the guests immediately retire to their huts, which are made, on that occasion, of their canoes and mats. The natives who have feveral wives do not with hold them from their guests; but where the owner of the hut has himfelf but one wife, he then makes the offer of a female fervant.

Their hunting feafon is principally from the end of October to the beginning of December; during which time they kill great numbers of young fea-bears for their clothing. They pass all December in feathings and diversions fimilar to those above mentioned: with this difference, however, that the men dance in woodenmasks, representing various sea-animals, and painted red, green, or black, with coarfe-coloured earths found

upon these islands.

During these feltivals, they visit each other from village to village, and from island to island. The feasts concluded, masks and drums are broken to pieces, or deposited in caverns among the rocks, and never afterwards made use of. In spring, they go out to kill old fea-bears, fea-lions, and whales. During fummer, and even in winter when it is calm, they row out to fea, and catch cod and other fish. Their hooks are of hone: and for lines they make use of a ftring made of a long tenacious fea-weed, which is fometimes found in those seas, near 160 yards in length.

Whenever they are wounded in any encounter, or bruifed by any accident, they apply a fort of yellow root to the wound, and fast for some time. When their head aches, they open a vein in that part with a stonelancet. When they want to glue the points of their arrows to the shafts, they strike their nose till it bleeds,

and ufe the blood as glue.

no judge. The following ceremonies are used in the burial of the dead. The bodies of poor people are wrapped up in their own clothes, or in mats; then, laid in a grave, and covered over with earth. The bodies of the rich are put, together with their clothes and arms, in a small boat made of the wood driven ashore by the sea: this boat is hung upon poles placed crosswife; and the body is thus left to rot in the open

The cultoms and manners of the inhabitants of the Aleutian ifles are nearly fimilar to those of the inhabitants of the Fox-islands. The former indeed are rendered tributary and entirely fubject to Ruffla; and most of them have a flight acquaintance with the Ruffian lauguage, which they have learned from the crews of the different veffels who have landed there.

KAN, or KHAN, the name of an officer in Persia. answering to that of governor in Europe.- There are kans of provinces, councries, and cities, who have diffe-

rent additions to diftinguish them.

KANGUROO. See DIDELPHIS. KANISCA, a very strong town of Lower Hungary, capital of the county of Selawar. It was taken by the Imperialifts in 1690. It is feated on the river

Drave, in E. Long. 17. 37. N. Lat. 46. 23. KAN-TCHEOU-FOU, a flourishing town of China, in the province of Kiang-fi. Its rivers, port, riches, and population, all contribute to attract frangers. A. day's journey from this city is a very rapid current, almost 20 leagues in length, which flows with great impetuolity over a number of feattered rocks that are level with the water. Travellers here are in great danger of being loft, unless they take care to be conducted by one of the pilots of the country; after this paffage. the river becomes twice as large as the Seine at Rouen: it is continually covered with loaded barks and other veifels under fail .- Near the walls of the city is a very long bridge, composed of 130 boats joined together by flrong iron chains. The cuftom house is upon this bridge, where a receiver constantly resides to visit all barks, and examine if they have paid the duties impofed on the commodities with which they are loaded, Two or three moveable boats are fo placed, that by their means the bridge can be opened or flut, to give or refuse a passage; and no barks are ever permitted to pass until they have been examined. In the territory belonging to this city, a great number of those valuable trees grow, from which varnish distils. Its district is extensive, and contains 12 cities of the third class.

KAOLIN, the name of an earth which is used as one of the two ingredients in oriental porcelain. Some of this earth was brought from China, and examined by Mr Reaumur. He found that it was perfectly infulible by fire, and believed that it is a talky earth; but Mr Macquer observes, that it is more probably of an argillaceous nature, from its forming a tenacious paste with the other ingredient called petuntfe, which has no tenacity. Mr Bomare fays, that by analyfing fome Chinese kaolin, he found it was a compound earth confifting of clay, to which it owed its tenacity a of calcareous earth, which gave it a meally appearance; of sparkling crystals of mica; and of small gravel, or particles of quartz-crystals. He says, that he has sound a fimilar earth upon a stratum of granite, and conjec-Murder is not punished among them; for they have tures that it may be a decomposed granite. This con-

Kaost- jecture is the more probable, as kaolins are frequently utmost exaggeration, but without any mention of the Kazeck chouk found in the neighbourhood of granites. See PORCE- 100,000 rupees. The baron, however, having got Katteeatte.

Subject to the Dutch. It was visited by Mr Ives in 1758. He found the fouth part of the island well to take possession of Kareck, whose inhabitants at that cultivated, with agreeable fields of corn, and produ- time amounted to no more than 100 poor fishermen. cing plenty of esculent vegetables. In the middle are very high hills abounding with a variety of shells. Some ment of the new colony; for he had but very few mafragments torn from their fides afforded an opportunity terials with him, and the government of Batavia was of observing an immense quantity of oysters, scallop, very slow in sending him the succours they had pro-cockle, and other shells. The common tree here is mised. He was therefore obliged to fend for workthe banian, but without those luxuriant shoots, which men from Persia and Arabia, with whose assistance he in some other places go downward and take root in built a small compact fort, strong enough to defend the ground. The lavender-cotton is also found here; itself against any of the country powers and any ships and the island abounds with fowl of various kinds. Pearl oysters are also found here, but lie at considerable India company. Nor was he content with putting depths. Mr Ives mentions one pearl of confiderable himself in a posture of desence, but even commenced fize, which had upon it a natural representation of hostilities against the Turks; and by detaining two the face of a human fetus in the early months of preg- veffels very richly laden, which happened to touch at

brother to one of that name fome time ago ambaffador at the court of London. Having left the Prussian service on some disguit, he entered into that of Ives visited him, he informs us, that surprising France. He afterwards went to the East Indies, progress had been made during the little time the and was appointed refident to the Dutch factory at Baffora. Here he became an object to the avarice he intended to make it a ftrong and wealthy place; and rapacity of the Turkish governors; who having got at the same time that he discovered his taste for literahim accused of capital crimes, he was at last glad to ture by advancing a sum of money for books and incompound with them for 50,000 rupees, the whole struments of various kinds, which were afterwards fum he was worth, belides giving directions how they might squeeze other 50,000 from his successor in of- quitted the service of the Dutch; and the island is fice (who in truth wished him turned out) and the again in possession of the sheick of Bundaric, to whom banian who did the business of the Dutch factory, and it formerly belonged. It is about five miles long and who had likewife been concerned in underland practices against him.

The new refident was overloved at his accession, but loft all patience when he found himfelf obliged to pay 30,000 rupees to the governor as a compliment on his entering into a post of such consequence. Nor had the banian much better reason to be satisfied, being obliged to pay down 20,000 rupees to make up the fum which was to fatisfy the rapacity of the go- comes the modern word churl.

Baron Kniphaufen failed from Baffora the very day after he was fet at liberty; but having landed on this See BAGDAD, no 49. illand, he, in conjunction with an Arabian sheick, formed the plan of the fettlement. He then carried a letter from the sheick to the governor and council of Batavia, in which the former proposed to give up the fovereignty of the island. Before fetting out for this place, however, the baron took care to difpatch a messenger across the desart to Constantinople. acquainting the Dutch ambaffador with the treatment he had received, and requesting liberty of the grand vizier for the Dutch to fettle at Kareck. The meffenger returned with a favourable answer before the to the Kattegatte the name of Sinus Codanus. Its baron came back from Batavia. The governor of Baffora, then, having attempted in vain to perfuade proaches the found; which begins with 16 fathoms. him to return to that place, wrote a letter of com- and near Copenhagen shallows to even four: The Ro-

intelligence of this proceeding, used such diligence that he got back to Batavia in the very ship which carried the letter. Being thus present on the spot to anfwer the charges brought against him, he acquitted KARECK, an island in the Persian Gulf, lately himself so well that his scheme was instantly approved of, and he was fent back with two ships and 50 men

Confiderable difficulties now occurred in the establishufually failing to India, excepting those of our East the island, he at last obliged the governor of Bassora This fettlement was founded by Baron Kniphaufen, to pay back the 100,000 rupees he had extorted, 30,000 of which he reftored to his fucceifor in office at Baffora, and 20,000 to the banian. When Mr baron had held the fovereignty of the island, and that punctually fent. After that time, however, the baron two in breadth; lying nearly in the middle of the Perfian Gulf, about feven leagues from each fide, and about 30 leagues from the mouth of Baffora river, where all thips bound to that port must call for pilots.

KARLE, a Saxon word used in our law, sometimes fimply for a man; and fometimes, with an addition, for a fervant or clown. Thus the Saxons call a feaman bufearli, and a domestic fervant bufearle. From hence

KARMATIANS, a fect of Mohammedans, who occasioned great disorders in the empire of the Arabs.

KASI'RIL, or KESTRIL. See FALCO.

KATTEGATTE, a noted fea lying between part of Jutland and the coast of Sweden, and towards the latter covered with a great number of isles. It is almost closed at the extremity by the low Danish islands of Sealand and Funen, which had in old times been (with Sweden) the feat of the Suiones. Between the first and the coast of Sweden is the famous found, the passage tributary to the Danes by thousands of ships. These islands were of old called Codonania, and gave greatest depth is 35 fathonis. It decreases as it applaint to Batavia, accusing the baron in terms of the man sleet, under the command of Germanicus, sailed, 3 I 2 accor-

Kauffbeuren Kedron. according to Pliny, round Germany, and even doubled the Cimbricum Promontorium, and arrived at the islands which fill the bottom of the Kattegatte : either by obfervation or information, the Romans were acquainted with 23. One they called Gleffaria, from its amber, a fosfil abundant to this day on part of the fouth fide of the Baltic. A Roman knight was employed by Nero's mafter of the gladiators to collect in these parts that precious production, by which he came perfeetly acquainted with this country.

KAUFFBEUREN, a free and imperial town of Germany, fituated in the river Wardach, in E. Long.

10. 53. N. Lat. 47. 57. KAY, QUAY, or Key. See KRY.

KAZY, in the East Indies, a Mahometan judge or magistrate; appointed originally by the court of Delhi to administer justice according to their written law; but particularly in matters relative to marriages, the fales of houses, and transgressions of the Koran. He attests or authenticates writings, which under his feal are admitted as the originals in proof.

KEBLA, an appellation given by the Mahometans to that part of the world where the temple of Mecca is fituated, towards which they are obliged to turn them-

selves when they pray.

KECKERMAN (Bartholomew), a native of Dantzick, and professor of philosophy there about the beginning of the 17th century, composed systems of almost all the sciences, in which he shows more method than genius. He died in 1609, fairly worn out at the age of 38 with mere scholastic drudgery.

KEDAR (anc. geog.), a district in the defart of the Saracens (fo called from Cedar, the fon of Ishmael, according to Jerome, who in another place fays that Kedar was uninhabitable), on the north of Arabia Felix. Kedareni, the people; who dwelt in tents like the other Scenites (Pfalm cxx.), were rich in cattle (Ifaiah lx.), of a fwarthy complexion (Canticles i.), and

excellent at the bow (Ifaiah xxi.)

KEDES (anc. geog.), a city of refuge and Levitical in the tribe of Naphthali, on the confines of Tyre and Galilee; (Josephus). Jerome calls it a facerdotal city, fituated on a mountain 20 miles from Tyre, near Paneas, and called Cidiffus, taken by the king of Affyria .- Another Kedes in the tribe of Islachar (I Chron. vii. 72.) which feems to be called Kifion (Joshua xix.)

KEDGE, a fmall anchor, used to keep a ship steady whilft she rides in a harbour or river, particularly at the turn of the tide, when she might otherwise drive over her principal anchor, and entangle the stock or flukes with her flack-cable, fo as to loofen it from the ground. This is accordingly prevented by a kedgerope that hinders her from approaching it. The Kedges are particularly useful in transporting a ship; i. e. removing her from one part of the harbour to another, by means of ropes which are fastened to these anchors. They are generally furnished with an iron flock, which is eafily displaced for the convenience of flowing them.

KEDRON, or CEBRON (anc. geog.), a town which, from the defeat and pursuit of the Syrians (I Mac. xvi.), appears to have stood on the road which led from the Higher India to Azotus: in this war it was burnt by the lews.

a brook, but Josephus a deep valley between Jerusalem and mount Olivet to the east; called also Kedron from Keelson. its blackness. A brook only in winter, or in rainy weather, aecording to Maundrel.

KEEL, the principal piece of timber in a ship, which is usually first laid on the blocks in building. If we compare the carcafe of a ship to the skeleton of the human body, the keel may be confidered as the backbone, and the timbers as the ribs. It therefore fupports and unites the whole fabric, fince the stem and ftern-post, which are elevated on its ends, are in some measure a continuation of the keel, and ferve to connect and inclose the extremities of the fides by tranfoms; as the keel forms and unites the bottom by tim-

The keel is generally composed of feveral thick pieces placed lengthways, which, after being scarfed together, are bolted, and clenched upon the upper fide. When these pieces cannot be procured large enough to afford a fufficient depth to the keel, there is a strong thick piece of timber bolted to the bottom thereof, called the false keel, which is also very useful in preserving the lower fide of the main keel. In our largest ships of war, the false keel is generally composed of two pieces, which are called the upper and the lower falle keels. See MIDSHIP- Frame.

The lowest plank in a ship's bottom, called the garboard-fireak, has its inner-edge let into a groove or channel cut longitudinally on the fide of the keel; the depth of this channel is therefore regulated by the thick-

ness of the garboard-streak.

KEEL is also a name given to a low flat-bottomed veffel, used in the river Tyne to bring the coals down from Newcastle and the adjacent parts, in order to load the

colliers for transportation. KEEL Hauling, a punishment inflicted for various offences in the Dutch navy. It is performed by plunging the delinquent repeatedly under the ship's bottom on one fide, and hoilting him up on the other. after having passed under the keel. The blocks or pullies by which he is fuspended are fastened to the opposite extremities of the main yard, and a weight of lead or iron is hung upon his legs, to fink him to a competent depth. By this apparatus he is drawn close up to the yard-arm, and thence let fall fuddenly into the fea, where, passing under the ship's bottom, he is hoisted up on the opposite side of the vessel. As this extraordinary fentence is executed with a ferenity of temper peculiar to the Dutch, the culprit is allowed fufficient intervals to recover the fense of pain, of which indeed he is frequently deprived during the operation. In truth, a temporary infensibility to his fufferings ought by no means to be conftrued into a difrespect of his judges, when we consider that this punishment is supposed to have peculiar propriety in the depth of winter, whilft the flakes of ice are floating on the fiream; and that it is continued tillthe culprit is almost suffocated for want of air, benumbed with the cold of the water, or stunned with. the blows his head receives by firiking the ship's

KEELSON, a piece of timber which may be properly defined the interior or counter-part of the keel; as it is laid upon the middle of the floor-timbers, im-KEDRON, or Cedron (anc. geog.), St John calls it mediately over the keel, and like it composed of se-

Keepes, veral pieces fearfed together. In order to fit with people on its top, and a greater number at its bottom Keeping. more fecurity upon the floor-timbers and crotches, it is notched about an inch and a half deep, opposite to each of those pieces, and thereby firmly scored down upon them to that depth, where it is fecured by fpike nails. The pieces of which it is formed are only half the breadth and thickness of those of the keel.

The keelfon ferves to bind and unite the floor-timbers to the keel. It is confined to the keel by long bolts. which, being driven from without through feveral of the timbers, are fore-locked or clenched upon rings on

the upper-fide of the keelfon.

KEEPER OF THE GREAT SEAL, is a lord by his office, and ftyled lord keeper of the great feal of Great Britain; he is always one of the privy-council. All grants, charters, and commissions of the king under the great feal, pass through the hands of the lord keeper; for without that feal many of those grants, &c. would be of no force; the king being, in the interpretation of the law, a corporation, and therefore paffes nothing but by the great feal, which is also faid to be the public faith of the kingdom, being in the highest esteem and reputation.

Whenever there is a lord-keeper, he is invested with the fame place, authority, pre-eminence, jurifdiction, or execution of laws, as the lord-chancellor of Great Britain is vefted with.

The lord-keeper is conflituted by the delivery of

the great feal, &c.

KEEPER of the Privy-feal, is also a lord by his office, through whose hands all grants, pardons, &c. pass before they come to the great seal; and even fome things pass his hands which do not pass the great feal at all. This officer is also one of the privycouncil, yet was anciently called clerk of the privy feal, His duty is to put the feal to no grant, &c. without a proper warrant; nor with warrant where it is against law, or inconvenient, but shall first acquaint the king

therewith.

KEEPING, in painting, denotes the representation of objects in the fame manner that they appear to the eye at different distances from it; for which the painter should have recourse to the rules of perspective. There are two instances in which the famous Raphael Urbin has transgreffed these rules: in one of his cartons, reprefenting the miraculous draught of fishes, the men in each of the two boats appear of full fize, the features of their faces being strongly marked; and the boats are reprefented fo fmall, and the men fo big, that any one of them appears fufficient to fink either of the boats by his own bare weight: and the fowls on the shore are also drawn so big, as to seem very near the eye of the observer, who could not possibly, in that cafe, diftinguish the features of the men in the distant boats. Or, supposing the observer to be in either of the boats, he could not fee the eyes or beaks of the fowls on the shore. The other instance occurs in his historical picture of our Saviour's transfiguration on the mount; where he is reprefented with those who were then with him, almost as large as the rest of his disciples at the foot of the mount, with the father and mother of the boy whom they brought to be cured; and the mother, though on her knees, is more than half as tall as the mount is high. So that the mount appears only of the fize of a little hay-rick, with a few

on the ground; in which case, a spectator at a little diftance could as well diftinguish the features of those at the top as of those on the ground. But upon any large eminence, deferving the name of a mount, that would be quite impossible.

KEIL, a very important fortress of Germany, feated on the banks of the Rhine, built by the French after a defign of marshal Vauban, for the defence of Strafburg. It was ceded to the empire in 1697, by the treaty of Ryswick. The French retook it in 1703, and it was reftored to the empire by the treaty of Re-

ftadt, E. Long. 7. 45. N. Lat. 48. 40. KEILL (Dr John), a celebrated aftronomer and

mathematician, was born at Edinburgh in 1671, and fludied in the university of that city. In 1604 he went to Oxford; where, being admitted of Baliol college, he began to read lectures according to the Newtonian fystem in his private chamber in that college. He is faid to have been the first who taught Sir Isaac Newton's principles by the experiments on which they are founded: and this, it feems, he did by an apparatus of instruments of his own providing, by which means he acquired a great reputation in the university. The first specimen he gave the public of his skill in mathematical and philotophical knowledge, was his Examination of Dr Burnet's theory of the earth, with Remarks on Mr Whiston's theory: and these theories being defended by their respective inventors, drew from Mr Keill An examination of the reflections on the theory of the earth, together with A defence of the remarks on Mr Whiston's new theory. In 1701, he published his celebrated treatife, intitled, Introductio ad veram playficam, which 'only contains 14 lectures; but in the following editions he added two more. This work has been translated into English, under the title of An introduction to natural philosophy. Afterwards, being made fellow of the Royal Society, he published, in the Philosophical Transactions, a paper, of the laws of attraction; and being offended at a passage in the Acta eruditorum of Leipfic, warmly vindicated against Mr Leibnitz Sir Isaac Newton's right to the honour of the first invention of his method of fluxions. In-1709 he went to New-England as treasurer of the Palatines. About the year 1711, feveral objections being urged against Sir Isaac Newton's philosophy, in support of Des Cartes's notions of a plenum, Mr Keill published a paper in the Philosophical Transactions on the rarity of matter, and the tenuity of its compo-But while he was engaged in this difpute, queen Anne was pleased to appoint him her decypherer; and he continued in that place under king George I. till the year 1716. He had also the degree of doctor of physic conferred on him by the university of Oxford in 1713. He died in 1721. He published, belides the works already mentioned, Introductio ad veram aftronomiam, which was translated into English by Dr Keill himself; and an edition of Commandinus's Euclid, with additions of his own.

Keill (James), M. D. an eminent physician, and brother of the former, was born in Scotland about the year 1673; and having travelled abroad, read lectures of anatomy with great applause in the universities of Oxford and Cambridge, by the latter of which he had the degree of doctor of physic conferred upon hing. Keifersberg In 1700 he set led at Northampton, where he had he made. In this manner the king and the marshal Keilington, Soith, confiderable practice as a physician; and died there of a cancer in the mouth in 1710. He published, 1. An English translation of Lemery's chemistry, 2. An account of animal fecretion, the quantity of blood in the human body, and muscular motion. 3. A treatise on anatomy. 4. Several pieces in the Philosophical Transactions.

KEISERSBERG, a town of Alface in France, and in the bailiwic of Haguenan, which has belonged to the French ever fince the year 1548. It is feated in a pleafant country, in E. Long. 7. 25. N. Lat.

KEISERSLAUERN, a town of Germany, in the Lower Palatinate, belonging to the elector Palatine : feated on the river Louter, in E. Long. 7. 51. N. Lat.

KEISERTOUL, a town of Switzerland, in the county of Baden, with a bridge over the Rhine, and a cattle. It belongs to the bishop of Constance, and is fituated in E. Long. 8 40. N. Lat. 47. 10.

KEISERWERT, a town of Germany in the circle of Westphalia, the diocese of Cologne, and the duchy of Berg; fubject to the elector Palatine. The fortifications are demolished. It is seated on the Rhine, in

E. Long. 6. 49. N. Lat. 51. 16. KEITH (James), field-marshal in the Prussian fervice, was the younger fon of William Keith, earl-marfhal of Scotland; and was born in 1696. He was defigned by his friends for the law; but his inclination led to aims, and the first occasion of drawing his sword was rather an unhappy one. When he was 18 years old the rebellion broke out in Scotland; and through the infligation of his mother, he joined James's party: he was wounded at the battle of Sheriff-muir, and made his escape to France. Here he applied himself to military fludies; and going to Madrid, he by the intereft of the duke of Liria obtained a commission in the Irish brigades, then commanded by the duke of Ormond. He afterwards attended the duke of Liria. when he went ambaffador to Muscovy; and being by him recommended to the czarina, was promoted to the rank of lieutenant-general, and invefted with the order of the black eagle. He diftinguished himself by his valour and conduct in the Russian service, and had no inconfiderable share in the revolution that raifed Elizabeth the daughter of Peter the Great to the throne: he also served in several embassies; but finding the honours of that country but a splendid kind of flavery, he left that court and entered the Prussian service. The king of Prussia made him field-marshal of the Prushan armies, and governor of Berlin; and diftinguished him so far by his confidence, as to travel in difguife with him over a great part of Germany, Poland, and Hungary. In bufiness, he made him his chief counfellor; in his diversions, his chief companion. The king was much pleafed with an amufement which the marshal invented in imitation of the game of chefs. The marshal ordered several thousand fmall statues of men in armour to be cast by a founder: thefe he would fet opposite to each other, and range them in battalia, in the same manner as if he had been drawing up an army; he would bring out a party from the wings or centre, and show the advantage or difadvantage resulting from the different draughts which

often amused themselves, and at the same time improved their military knowledge. This brave and experienced general, after many important fervices in the late wars of that illustrious monarch, was killed in the unfortunate affair of Hohkerchen in the year 1758.

The family of Keith was among the most ancient in Europe. In 1010 the Scots gained a complete victory over the Danes at Camus town in Angus; King Malcolm II. as a reward for the fignal bravery of a certain young nobleman who purfued and killed Camus the Danish general, bestowed on him several lands, particularly the barony of Keith in East Lothian, from which his posterity assumed their firname. The king also appointed him hereditary great marefchal of Scotland, which high office continued in his family till the year 1715, when the last earl engaged in the rebellion and forfeited his effate and honours; and thus ended the family of Marefehal, after ferving their country in a diftinguished capacity above 700

KELLINGTON, or KILKHAMPTON, a town of Cornwall in England, which fends two members to parliament. W. Long. 4. 38. N. Lat. 50. 36.

KELLS, a fair and pott-town of Ireland, in the county of Meath and province of Leinster, 31 miles from Dublin. It is a borough likewife, and returns two members to parliament; patron earl of Bective. This place gives title of viscount to the family of Cholmondeley. Near it is Headfort, the magnificent feat of Lord Bective. This town is pleasantly fituated on the river Blackwater, and has four fairs. It was anciently called Kenanus, and afterwards Kenlis. In former ages it was one of the most famous cities in the kingdom; and on the arrival of the English was walled and fortified with towers. In 1178 a castle was erected where the market place now is; and opposite to the castle was a cross of an entire stone, ornamented with bas-relief figures and many curious inscriptions in the ancient Irish character. Within a fmall diftance was the church of St Senan; and on the fouth of the churchyard is a round tower which measures 99 feet from the ground, the roof ending in a point; and near the top were four windows opposite to the cardinal points. There was a celebrated monaftery founded here in 550 for regular canons, and dedicated to the Virgin Mary. It owed its origin to St Columb, to whom the fite of the abbey was granted by Dermod Mac Carval, or Dermod the fon of Kervail king of Ireland. An epifcopal fee was afterwards erected here, which in the 13th century was united to that of Meath. A priory or hospital was also erected by Walter de Lacie, lord of Meath, in the reign of Richard I. for crofs-bearers or crouched friars following the order of St Augustin. There was likewife a perpetual chantry of three priefts or chaplains in the parish-church of St Columb in Kells to celebrate mass daily; one in the Rood chapel, another in St Mary's chapel, and a third in the chapel of St Cather rine the virgin.

KELLS is also the name of a village, being a post and fair town in the county of Kilkenny, 64 miles from Dublin. It is an ancient place, ficuated on Kings river; and was noted for a priory of Augustines, built and richly endowed by Geoffroy Fitz-Roberts, who

Kelly. came into this kingdom with Strongbow, The prior of this place had the title of lard spiritual, and as fuch fat in the house of peers before the Reformation; the rning only of this abbey now remain; a fynod was held in it anno 1152, when John Paparo, legate from Rome, made one of the number of bishops that were ronvened there at that time to fettle the affairs of the church. The prefent church is built in the Gothic manner. Fairs held 13th July.

There is a third place of the above name, fituated in the county of Antrim and province of Uliter, 89 miles from Dublin, near which are the ruins of a church: this place is but a fmall village, feated on a river of the same name, over which it has a bridge.

KELLY (Hugh), an author of confiderable repute, was born on the banks of Killarney lake in Ireland in 1739. His father, a gentleman of good family, having reduced his fortune by a feries of unforefeen misfortunes, was obliged to repair to Dublin that he might endeavour to support himself by his perfonal industry. A tolerable school education was all he could afford to his fon; who was bound an apprentice to a staymaker, and served the whole of his time with diligence and fidelity. At the expiration of his indentures, he fet out for London to procure a livelihood by his bufiness; where he encountered all the difficulties a person poor and without friends could be fubiect to on his first arrival in town. Happening, however, to become acquainted with an attorney, he was employed by him in copying and transcribing; an occupation which he profecuted with fo much affiduity, that he is faid to have earned about three guineas a- week, an income which, compared to his former gains, might be deemed affluent. Tired, however, of this drudgery, he foon after, about 1762, commenced author, and was intrusted with the management of the Lady's Museum, the Court Magazine, the Public Ledger, the Royal Chronicle, Owen's Weekly Post, and some other periodical publications, in which he wrote many original effays and pieces of poetry, which extended his reputation, and procured the means of subfiltence for himself, his wife to whom he was then lately married, and a growing family. For feveral years after this period, he continued writing upon a variety of fubjects, as the accidents of the times chanced to call for the affiftance of his pen; and as during this period politics were the chief objects of public attention, he employed himself in composing many pamphlets on the important questions then agitated, the greater part of which are now buried in oblivion. Among thefe, however, was a Vindication of Mr Pitt's Administration, which Lord Chesterfield makes honourable mention of in the fecond volume of his letters. In 4767, the Babler appeared in two pocket volumes, which had at first been inferted in Owen's Weekly Chronicle in fingle papers; as did the Memoirs of a Magdalene, under the title of Louisa Mildmay. About 1767 he was tempted by the fuccess of Churchill's Rosciad to write some strictures on the performers of either theatre, in two pamphlets, intitled The/pis, both which gave great offence to some of the principal persons at each house. The talents for fatire, which he displayed in this work, recommended him to the notice of Mr Garrick, who in the next year caused his first play of False Delicacy applause; and from this time he continued to write for the flage with profit and fuccefs, until the last period of his life. As his reputation increased, he began to turn his thoughts to fome mode of supporting his family less precarious than by writing, and for that purpole entered himfelf a member of the Middle Temple. After the regular steps had been taken, he was called to the bar in 1774, and his proficiency in the fludy of the law afforded promiting hopes that he might make a diffinguished figure in that profession. His feden. tary course of life had, however, by this time injured his health, and subjected him to much affliction. Early in 1777 an abscess formed in his fide, which after a few days illness put a period to his life. He was the author of fix plays befides that above-mentioned.

KELP, in the glass-trade, a term used for a fort of potashes made use of in many of the glass-works, particularly for the green glass. It is the calcined ashes of a plant called by the same name; and in some places, of fea-thongs or laces, a fort of thick-leaved fucus or fea-wrack *. This plant is thrown on the * See Fucus; rocks and shores in great abundance, and in the fummer months is raked together and dried as hay in the fun and wind, and afterwards burnt to the ashes called kelp. The process of making it is thus: The rocks. which are dry at low water, are the beds of great quantities of fea-weed; which is cut, carried to the beach, and dried: a hollow is dug in the ground three or four feet wide; round its margin are laid a row of ftones, on which the fea-weed is placed, and fet on fire within, and quantities of this fuel being continually heaped upon the circle, there is in the centre a perpetual flame, from which a liquid like melted metal drops into the hollow beneath : when it is full, as it commonly is ere the close of day, all heterogeneous matter being removed, the kelp is wrought with iron rakes, and brought to an uniform confiftence in a state of fusion. When cool, it confolidates into a heavy dark-coloured alkaline fubstance, which undergoes in the glass-houses a second vitrification, and assumes a perfect transparency; the progress by which thus a parcel of fea-weed, formerly the slimy bed of feals or dreary shelter of shell-fish, is converted into a crystal lustre for an assembly-rown, or a fet of glasses for his majefly's table, is a meta norphotis that might be a fubject for an entertaining tale.

KELSO, a town of Roxburghshire in Scotland. pleafantly fituated on the river Tweed, in W. Long. 1. 20. N. Lat. 55. 38. Of this town Mr Pennant gives the following description. It is built much after the manner of a Flemish town, with a square and town-house. It contains about 2700 fouls, has a very confiderable market, and great quantities of corn are fold here weekly by fample. The abbey of Tyronenfians was a vast pile, and, to judge by the remains, of venerable magnificence. The walls are ornamented with falfe round arches, interfecting each other. Such interfections form a true Gothic arch; and may as probably have given rife to that mode as the arched shades of avenues. The steeple of the church is a vast tower. This house was founded by David I. when earl of Cumberland. He first placed it at Selkirk. then removed it to Roxburgh, and finally, when he came to the crown, fixed it here in 1128. Its reveto be acted at Drury-Lane. It was received with great nues were in money above 2000 l. Scots a-year. The 20dds

Kempten.

Kempis abbot was allowed to wear a mitre and pontifical barony of Walburg. It is about 17 miles long and robes; to be exempt from episcopal jurisdiction, and permitted to be prefent at all general councils. The environs of Kelfo are very fine: the lands confift of gentle rifings, inclosed with hedges, and extremely fertile. They have much reason to boast of their profpects. From the Chalkheugh is a fine view of the forks of the rivers, Roxburgh-hill, Sir John Douglas's neat feat, and at a diftance Flenrus; and from Pinnicle-hill is feen a vaft extent of country, highly cultivated, watered with long reaches of the Tweed, well wooded on each margin. These borders ventured on cultivation much earlier than those on the west and east, and have made great progress in every species of rural economy. Turnips and cabbages for the use of cattle cover many large tracts; and potatoes appear in vaft fields. - Much wheat is raifed in the neighbourhood, part of which is fent up the frith of Forth, and part into England. The fleeces here are very fine. The wool is fent into Yorkshire, to Linlithgow, or into Aberdeenthire, for the stocking manufacture; and some is woven here into a cloth called plains, and fold into England to be dreffed. Here is alfo a confiderable manufacture of white leather, chiefly to supply the capital of Scotland. At Kelfo there is a fine stone bridge of fix arches over the Tweed near its confluence with the Teviot.

KEMPIS (Thomas à), a pious and learned regular canon, was born at the village of Kemp, in the diocefe of Cologn, in 1380; and took his name from that village. He performed his studies at Deventer, in the community of poor scholars established by Gerard Groot; and there made a great progress in the sciences. In 1300, he entered the monaftery of the regular canons of Mount St Agnes, near Zwol, of which his brother was prior. Thomas a Kempis there diffinguished himself by his eminent piety, his respect for his fuperiors, his charity to his brother canons, and his continual application to labour and prayer. He died in 1471, aged 70. The best editions of his works, which confift of fermons, spiritual treatifes, and lives of holy men, are those of Paris in 1649, and of Antwerp in 1607. The famous and well-known book De Imitatione Christi, which has been translated into almost all the languages of the world, though it has almost always been numbered among the works of Thomas à Kempis, is also found printed under the name of Gerson; and on the credit of some MSS. has been since ascribed to the abbot Gerson of the order of St Benedict. This has occasioned a violent dispute between the canons of St Augustine and the Benedictines: but while devout Christians find spiritual comfort in the work, the name of the writer is of small

KEMPTEN, a free and imperial town of Germany, in Lower Suabia, and in Algow, and also in the territory of the abbot of Kempten, who is a prince of the empire, and has a voice in the diet. The inliabitants are Protestants; and it has been feveral times taken, but has always recovered its liberty. It is feated on the river Iller. E. Long. 10. 33. N. Lat.

KEMPTEN, a territory in the circle of Suabia, in Nº 171.

Kempten and Kauffbeuren, which are imperial. KEN (Thomas), an eminent English bishop in the 17th century, was bred at Winchester school, whence he went to Oxford; and in 1669 was made a prebend of Winchester. In 1675, the year of the Jubilee, he travelled to Rome; and used to sav. He had reason to give God thanks for his travels, having returned more confirmed of the purity of the reformed religion than he was before. He was appointed by king Charles II. to attend the lord Dartmouth at the demolishing of Tangier; and at his return was made chaplain to his majesty, as he was some time after to the princess of Orange, then refiding in Holland. In 1685 he was confecrated bishop of Bath and Wells. The month following he attended king Charles II. at his death; and gave close attendance at the royal bed for three whole days and nights, watching proper intervals to fuggest pious and proper thoughts on fo ferious an oc-casion. In the following reign he zealously opposed the progress of Popery; and in June 1688, he, with five other bishops and the archbishop of Canterbury, was committed prisoner to the Tower of London for fubfcribing a petition to his majefty against the declaration of indulgence. Upon the Revolution, however, he refused to take the oaths to king William and Queen Mary, on which account he was deprived of his bishopric. Her Majesty queen Anne bestowed on him a yearly pension of 2001, to his death in 1710. He

published feveral pious books. His charity was fo great, that when he was bishop of Bath and Wells, having received a fine of 4000 l. he gave a great part of

it to the French Protestants.

KENDAL, a town of Westmoreland, seated in a valley, among hills, on the west side of the river Cam or Ken, over which there are two stone bridges, and one of wood which leads to the cattle now in ruins. It is a large handsome place; and has two long streets. which cross each other. The inhabitants have driven a trade with the cotton and woollen manufactory throughout England ever fince the reign of Edw. III. and particular laws were enacted for regulating Kendal cloaths as early as Richard II. and Henry IV. It is of note also for the manufactory of cottons, druggets, ferges, hats, worsted and yarn stockings, &c. Queen Elizabeth incorporated it with aldermen and burgesses; and king James I. with a mayor, recorder, town-clerk, 12 aldermen, 24 burgeffes or common councilmen, and 2 attornies. There are 7 companies here, who have each their hall, viz. merceis, sheermen, cordwainers, glovers, tanners, taylors, and pewterers. Here is an elegant town-hall lately repaired; and they enjoy a court of conscience granted by George III. for debts under 40s. It has a large beautiful church, which stands on the other side of the brook called Blindbeck, out of the liberty of the town: a large neat and handsome building 180 feet long and 99 broad, with 5 ailes each parted by a row of 8 pillars, and a strong square steeple. Near is Abbot's-hall, the residence of the abbot when this church belonged to an abbey diffolved by Henry VIII. In 1755, a new chapel was erected in the middle of Germany, between the bishopric of Augsburg and the the town, besides which there are 12 chapels of ease belonging

Kennel. belonging to it. The diffenters and quakers have meeting-houses. Here is a free grammar-school well endowed; and also a charity-school for 10 boys and 16 girls, who are all cloathed as well as taught. Eastward of the town, on the opposite side of the river on a hill, from whence is a fine prospect, thand the ruins of a castle, wherein was born Catherine Parr (the fixth wife of Henry VIII.) By the late inland navigation, it has communication with the rivers Mercy, Dee, Ribble, Oufe, Trent, Darwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles in the counties of Lincoln, Nottingham, York, Lancaster, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c. Here are kept the fessions of the peace for this part of the county called the barony of Kendal; and there is a very great market on Saturday, with all kinds of provisions and woollen-yarn, which the girls bring hither in large bundles. It has fairs on May 6, and November 8; and between them a great beaft-market every fortnight. The river here, which runs half through the town in a ftony channel, abounds with trout and falmon; and

> KENNEL, a term used indifferently for a puddle. a water-course in the streets, a house for a pack of hounds, and the pack or cry of hounds themselves.

on the banks of it live the dyers and tanners.

Mr Beckford, in his Effay on Hunting, is very particular in describing a kennel for hounds; and a kennel he thinks indifpenfably necessary for keeping those animals in proper health and order. " It is true (fays he) hounds may be kept in barns and stables; but those who keep them in fuch places can best inform you whether their hounds are capable of answering the purposes for which they are defigned. The fense of fmelling is fo exquifite in a hound, that I cannot but suppose that every flench is hurtful to it. Cleanliness is not only absolutely necessary to the nose of the hound, but also to the preservation of his health. Dogs are naturally cleanly; and feldom, if they can help it, dung where they lie. Air and fresh straw are necessary to keep them healthy. They are subject to the mange; a diforder to which poverty and naftiness will very much contribute. The kennel should be fituated on an eminence; its front ought to be to the eaft, and the courts round it ought to be wide and airy to admit the funbeams at any time of the day. It is proper that it should be neat without and clean within; and it is proper to be near the mafter's house, for obvious reasons. It ought to be made large enough at first, as any addition to it afterwards may spoil it in appearance at least." Two kennels, however, in our author's opinion, are abfolutely necessary to the well-being of hounds; " When there is but one (fays he), it is feldom fweet ; and when cleaned out, the hounds, particularly in winter, fuffer both while it is cleaning and afterwards as long as it remains wet."

When the feeder first comes to the kennel in a morning, he should let out the hounds into the outer court; and in bad weather, should open the door of the hunting kennel (that in which the hounds defigned to hunt next day are kept), least want of rest should incline them to go into it. The lodging room should then be cleaned out, the doors and windows of it opened, the litter shaken up, and the kennel made fweet and clean before the hounds return to it again .-

Vol. IX. Part II.

The floor of each lodging room should be bricked, and Kennel, floped on both fides to run to the centre, with a gut- Kennet. ter left to carry off the water, that when they are washed they may foon be dry. If water should remain through any fault in the floor, it must be carefully mopped up : for damps are always very prejudicial.

The kennel ought to have three doors; two in the front and one in the back ; the last to have a latticewindow in it with a wooden shutter, which is confantly to be kept closed when the hounds are in, except in fummer, when it should be left open all the day.

At the back of Mr Beckford's kennel is a house thatched and furzed up on the fides, big enough to contain at least a load of straw. Here should be a pit ready to receive the dung, and a gallows for the flesh. The gallows should have a thatched roof, and a circular board at the posts to prevent vermin from climbing up. He advises to inclose a piece of ground adjoining to the kennel for fuch dog-horfes as may be brought alive; it being fometimes dangerous to turn them out where other horses go, on account of the disorders with which they may be infected. In some kennels a stove is made use of; but where the feeder is a good one. Mr Beckford thinks that a mop properly used will render the stove unnecessary. "I have a little hay rick (fays he) in the grafs-yard, which I think is of use to keep the hounds clean and fine in their coats. You will frequently find them rubbing themselves against it. The shade of it is also useful to them in summer. If ticks at any time be troublesome in your kennel, let the walls of it be well washed; if that should not deftroy them, the walls must then be white-washed."

Befides the directions already given concerning the fituation of the kennel, our author recommends it to have a stream of water in its neighbourhood, or even running through it if possible. There should also be moveable flages on wheels for the hounds to lie on.

The foil ought at all events to be dry.

To KENNEL, a term applied by fox-hunters to a fox when he lies in his hole.

KENNET (Dr White), a learned English writer and bishop of Peterborough, in the 18th century, bred at St Edmund-hall, Oxford; where he foon diftinguished himfelf by his vigorous application to his studies, and by his translations of feveral books into English, and other pieces which he published. In 1695 our author published his Parochial Antiquities. A fermon preached by him on the 30th of January 1703 at Aldgate exposed him to great clamour. It was printed under the title of A compassionate inquiry into the causes of the civil war. In 1706, he published his Case of Impropriations, and two other tracts on the fame fubject. In 1706, he published the third volume of The Complete History of England (the two former volumes compiled by Mr Hughes). In 1700, he published A Vindication of the Church and Clergy of England from fome late reproaches rudely and unjuftly cast upon them; and A true Answer to Dr Sacheverel's Sermon. When the great point in Dr Sacheverel's trial, the change of the ministry, was gained, and very strange addresses were made upon it, there was to be an artful address from the bishop and clergy of London, and they who would not subscribe it were to be represented as enemies to the queen and the ministry. Dr Kennet fell under this imputation. He was exposed

Kennet, to great odium as a low church man, on account of Kennicott. his conduct and writings. When he was dean of Peterborough, a very uncommon method was taken to expose him by Dr Walton, rector of the church of White-chapel: for in the altar-piece of that church, which was intended for a reprefentation of Christ and his 12 apostles eating the passover and last supper, Judas the traitor was drawn fitting in an elbow-chair, dressed in a black garment, with a great deal of the air of Dr Kennet's face. It was generally said that the original sketch was for a bishop under Dr Walton's displeasure; but the painter being apprehensive of an action of Scandalum Magnatum, leave was given to drop the bishop, and make the dean. This giving general offence, upon the complaint of others (for Dr Kennet never faw it, or feemed to regard it), the bifhop of London ordered the picture to be taken down. In 1713, he prefented the fociety for propagating the gospel with a great number of books, suitable to their defign ; published his Bibliotheca Americana Primordia, and founded an antiquarian and historical library at Peterborough. In 1715, he published a fermon, intitled The Witchcraft of the prefent Rebellion, and afterward feveral other pieces. In 1717, he was engaged in a dispute with Dr William Nicholson, bishop of Carlifle, relating to fome alterations in the bishop of Bangor's famous fermon; and difliked the proceedings of the convocation against that bishop. Upon the death of Dr Cumberland bishop of Peterborough, he was promoted to that fee, to which he was confecrated in 1718. He fat in it more than ten years, and died in 1728. He was an excellent philologist, a good preacher, whether in English or Latin, and well versed in the histories and antiquities of our nation.

KENNET (Bafil), a learned English writer, and brother to the preceding, was educated in Corpus Christi college, in the university of Oxford, where he became fellow. In 1706, he went over chaplain to the English factory at Leghorn; where he met with great opposition from the Papifts, and was in danger from the inquisition. He died in the year 1714. He published Lives of the Greek Poets; the Roman Antiquities; a volume of Sermons preached at Leghorn; A translation into English of Puffendorf's Treatise of the Law of Nature and Nations. He was a man of most exemplary integrity, generofity, piety, and modefty. KENNICOTT (Dr Benjamin), well known in the

learned world for his elaborate edition of the Hebrew Bible and other valuable publications, was born at Totness in Devonshire in the year 1718. With the rank and character of his parents we are entirely unacquainted; but it is certain they were unable to fatisfy that thirst for knowledge which they could not but difcover in their fon. Some opportunities of early improvement must, however, have been afforded him, or (which we fometimes fee) the natural vigour of his mind must have superfeded the necessity of them. For in the year 1743, he wrote A Poem on the Recovery of the Hon. Mrs Eliz. Courtenay from her late dangerous Illness; and this probably recommended him to the notice of those gentlemen who afterwards fent him to Oxford and supported him there. In judging of this performance, they may be supposed to have confidered not fo much its intrinsic merit, as the circumstances under which it was produced. For though it might claim just praise as the fruit of youthful in-

poem it never rifes above mediocrity, and generally finks below it. But in whatever light these verses were confidered, the publication of them was foon followed by fuch contributions as procured for the author the advantages of an academical education. In the year 1744 he entered at Wadham college; nor was it long before he diftinguished himself in that particular branch of fludy in which he afterwards became fo eminent. His two differtations, On the Tree of Life, and The Oblations of Cain and Abel, came to a fecond edition fo early as the year 1747, and procured him the fingular honour of a bachelor's degree conferred on him gratis by the University a year before the statutable time. The differtations were gratefully dedicated to those benefactors whose liberality had opened his way to the University, or whose kindness had made it a feene not only of manly labour, but of honourable friendship. With fuch merit, and fuch support, he was a fuccefsful candidate for a fellowship of Exeter college, and foon after his admiffion into that fociety. he diltinguished himself by the publication of several occasional fermons. In the year 1753 he laid the foundation of that stupendous monument of learned industry, at which the wife and the good will gaze with admiration, when prejudice, and envy, and ingratitude, shall be dumb. This he did by publishing his first differtation, On the State of the Printed Hebrew Text, in which he proposed to overthrow the then prevailing notion of its absolute integrity. The first blow, indeed, had been struck long before, by Cappellus, in his Critica Sacra, published after his death by his fon, in 1650-a blow which Buxtorf, with all his abilities and dialectical skill, was unable to ward off. But Capellus having no opportunity of confulting MSS, though his arguments were supported by the authority of the Samaritan Pentateuch, of parallel paffages, and of the ancient vertions, could never absolutely prove his point. Indeed the general opinion was, that the Hebrew MSS. contained none, or at least very few and triffing variations from the printed text: and with respect to the Samaritan Pentateuch very different opinions were entertained. Those who held the Hebrew verity, of courfe condemned the Samaritan as corrupt in every place where it deviated from the Hebrew: and those who believed the Hebrew to be incorrect, did not think the Samaritan of fufficient authority to correct it. Belides, the Samaritan itself appeared to a very great advantage; for no Samaritan MSS, were then known, and the Pentateuch itself was condemned for those errors which ought rather to have been ascribed to the incorrectness of the editions. In this differtation, therefore, Dr Kennicott, proved that there were many Hebrew MSS. extant, which, though they had hitherto been generally fupposed to agree with each other, and with the Hebrew text, yet contained many and important various readings: and that from those various readings considerable authority was derived in support of the ancient versions. He announced the existence of fix Samaritan MSS. in Oxford only, by which many errors in the printed Samaritan might be removed; and he attempted to prove, that even from the Samaritan, as it was already printed, many passages in the Hebrew might undoubtedly be corrected. This work, as it was reasonable to expect, was examined with great feKannicott, verity both at home and abroad. In fome foreign uni- above 600 MSS, were collated, and that the whole verfities the belief of the Hebrew verity, on its being fuit fidei fociis, ut potius Helvetii theologi, et speciatim Ge- his death, he refigned his living in Cornwall, from nevenses, anno 1678, peculiari canone caverint, ne quis in ditione sua minister ecclesia recipiatur, nisi fateatur publice, textum Hebraum, ut hodie est in exemplaribus Masoreticis, quoad confonantes et vocales, divinum et authenticum effe, (Wolfii Biblioth. Heb. tom. ii. 27). And at home this doctrine of the corrupt state of the Hebrew text was opposed by Comings and Bate, two Hutchinsonians, with as much violence as if the whole truth of the revelation were at stake.

The next three or four years of Dr Kennicott's life were principally spent in fearthing out and examining Hebrew MSS, though he found leifure not only to preach, but to publish several occasional fermons. A. bout this time Dr Kennicott became one of the king's preachers at Whitehall; and in the year 1759 we find him vicar of Culham in Oxfordshire. In January 1760 he published his fecond differtation on the state of the Hebrew Text; in which, after vindicating the authority and antiquity of the Samaritan Pentateuch, he difarmed the advocates for the Hebrew verity of one of their most specious arguments. They had observed that the Chaldee Paraphrase having been made from Hebrew MSS. near the time of Christ, its general coincidence with the prefent Hebrew Text must evince the agreement of this last with the MSS. from which the paraphrase was taken. Dr Kennicott demonstrated the fallacy of this reasoning, by showing that the Chaldee Paraphrafe had been frequently corrupted, in order to reconcile it with the printed text; and thus the weapons of his antagonifts were fuccefsfully turned upon themselves. He appealed also to the writings of the Jews themselves on the subject of the Hebrew Text, and gave a compendious history of it from the close of the Hebrew canon down to the invention of printing, together with a description of 103 Hebrew MSS. which he had discovered in England, and an account of many others preserved in various parts of Euly called for by the most learned and enlightened of the friends of biblical criticism; and in this same year (1760) Dr Kennicott emitted his proposals for collating all the Hebrew MSS. prior to the invention of printing, that could be found in Great Britain and Ireland, and for procuring at the fame time as many collations of foreign MSS. of note, as the time and money he should receive would permit. His first subforibers were the learned and pious Archbishop Secker, and the delegates of the Oxford press, who with that liberality which has generally marked their character, gave him an annual fubscription of 40 l. In the first year the money received was about 500 guineas, in the the next it arose to 900, at which sum it continued stationary till the tenth year, when it amounted to

work occupied 20 years of Dr Kennicott's life, it must attacked by Capellus, had been infifted on as an arti- be owned that facred criticism is more indebted to him cle of faith-Ifa Capelli fententia adeo non approbata than to any scholar of any age. Within two years of confcientious motives, on account of his not having a profpect of ever again being able to vifit his parith. Although many good and confcientious men may justly think, in this case, that his professional labours carried on elsewhere might properly have intitled him to retain this preferment, and may apply this reasoning in other cases; yet a conduct so fignally difinterested deferves certainly to be admired and celebrated. Dr Kennicott died at Oxford, after a lingering illness, Sept. 18, 1782; and left a widow, who was fifter to the late Edward Chamberlayne, Efq; of the treasury. At the time of his death he was employed in printing Remarks on Select Paffages in the Old Testament; which were afterwards published, the volume having been completed from his papers.

KENO. See KINO.

KENRICK (William), an author of confiderable abilities, was the fon of a citizen of London, and brought up, it is faid, to a mechanical employment. This, however, he feems early to have abandoned; and to have devoted his talents to the cultivation of letters, by which he supported himself during the rest of a life which might be faid to have passed in a state of warfare, as he was feldom without an enemy to attack or to defend himself from. He was for some time student at Leyden, where he acquired the title of J. U. D. Not long after his return to England, he figured away as a poet in Epiftles Philosophical and Moral, 1759, addressed to Lorenzo; an avowed defence of intidelity, written whilft under confinement for debt, and with a declaration that he was " much lefs ambitious of the character of a poet than of a philofopher." From this period he became a writer by profession; and the Proteus shapes under which he appeared, it would be a fruitless attempt to trace. He was for a confiderable time a writer in The Monthly Review; but quarrelling with his principal, began rope. A collation of the Hebrew MSS. was now loud- a New Review of his own. When our great Lexicographer's edition of Shakespeare first appeared in 1765. it was followed in a fortnight by a pamphlet, intitled, " A Review of Dr Johnson's new Edition of Shake. fpeare, in which the ignorance or inattention of that editor is exposed, and the poet defended from the perfecution of his commentators, 1765." This pamphlet was followed by an Examination of it, and that by a Defence in 1766; in which year he produced his pleafant comedy of Falltaff's Wedding, at first intended to have been given to the public as an original play of Shakespeare retrieved from obscurity, and is, it must be acknowledged, a happy imitation of our great dramatic bard. With the celebrated English Roscius Dr Kenrick was at one time on terms of the ffrictett intimacy: but took occasion to quarrel with him in 1000. During the progress of the work the industry of print, in a mode too unmanly to be mentioned. In our author was rewarded by a canonry of Christ Church. politics also he made himself not a little conspicuous; He was also presented, though we know not exactly particularly in the dispute between his friends Wilkes when, to the valuable living of Mynhenyote, in Corn- and Horne. He was the original editor of The wall, on the nomination of the Chapter of Exeter. Morning Chronicle; whence being oufted for neglect, In 1776 the first volume was published, and in 1780 he set up a new one in opposition. He translated in the whole was completed. If now we confider that a very able manner the Emilius and the Eloifa of 3 K 2

by Milot (to injure, if possible, a translation of the fame work by Mrs Brooke); and produced several dramatic performances, together with an infinite variety of publications both original and translated. To him also the public are indebted for the collection (imperfect as it is) of The Poetical Works of Robert Lloyd, M. A. 1774, 2 vols 8vo. Dr Kenrick died June 9.

KENSINGTON, a village of Middlesex, on the western road from London, near 2 miles from Hide-Perk-Corner. It is extremely populous; and besides the palace, now neglected, contains many genteel houses, and several boarding-schools. The palace, which was the feat of the Lord Chancellor Finch afterwards Earl of Nottingham, was purchased by King William; who greatly improved it, and caused a royal road to be made to it, through St James's and Hide Parks, with lamp-posts erected at equal distances on each fide. Queen Mary enlarged the gardens. Her fifter Queen Ann improved what Mary had begun; and was so pleased with the place, that she frequently fupped during the fummer in the green-house, which is a very beautiful one: but Queen Caroline completed the defign by extending the gardens from the great road in Kenfington to Acton; by bringing what is forts, fo prudently disposed, and so well secured, were called the Serpentine-River into them; and by taking under the direction of a particular great officer, called in some acres out of Hide-Park, on which she caused a eafily turned round for shelter from the wind, since the British monarchs who governed here, after the Rodecayed. This mount is planted about with evergreens, and commands a fine view over the noble gardens, and the country fouth and west. They were originally defigned by Kent, and have lately been very much improved by Brown; and though they contain. no firiking beauties, which their flat fituation will not admit, yet they have many pleasing parts, and afford much delight to the inhabitants of London, particularly to those whose professions will not allow of frequent excursions to more distant places. These gardens, which are three miles and a half in compass, are kept in great order. The palace indeed has none of that grandeur which ought to appear in the residence of a British monarch; but the royal apartments are noble, and fome of the pictures good. It was at this place King William, Prince George of Denmark, Queen Ann, and King George II. died. The old church was pulled down in 1696, and a much better one built in its room. Part of this village, from the palace-gate to the Bell, is in the parish of St Margaret's, Westminster.

KENT, one of the counties of England, fituated at the fouth-east corner of the island, and from thence enjoying many advantages. The capacious æftuary of the Thames washes its northern parts, as the fea does the fouth-east; whence some with no great impropriety have styled it a peninfula. In point of extent, this is the fifth shire in South Britain, little less in its dimensions than the province of Holland; larger in fize than the duchy of Juliers in Germany; and almost exactly equal to that of Modena in Italy. Kent is, with great appearance of truth, supposed to be so ftyled from the ancient British word kant, signifying a corner, or, when applied to a country, an head land. It is certain, that the Romans bestowed the name of the reign of Henry VIII. The slat country is re-

Kenling- Rouffeau; the Elements of the History of England Cantium on the province, and on its most conspicuous promontory the north Foreland; and from the diffrict they inhabited, the people were called Cantii; which has prevailed even to our times, when Kent, and the the men of Kent, are the common appellatives. It is however probable, that these Cantii were not the original inhabitants, but a latter colony from the oppofite continent, established here, like the Belgæ, not long before the Roman invalion. At the time of Cefar's coming, this spacious and fertile region was divided into four principalities, or, as they are, according to the manners of those days, commonly called, kingdoms. It was his observation of these people, that Campbell's they were particularly diftinguished by their civility Political and politeness; a character which their descendants Survey. have preferved. When that wife people became masters of the fouthern parts of the island, this province received the most conspicuous marks of their attention. as appears from the flations which they fo prudently established, while their government flourished in its full vigour. The care they took of the ports on the fea-coast as foon as it came to be in danger, and the feveral fortreffes which they erected for the defence of their fubiects against the sudden attempts of barbarous invaders, are evidences of the fame kind. Thefe Littoris Saxonici Comes, i. e. the count of the Saxon mount to be erected, with a chair on it that could be shore; which office seems to have been preserved by mans quitted the ifle. The Saxon kings of Kent difcharged this trust in their legal capacity, from the middle of the fifth to the beginning of the ninth century. Under the northern princes, this post was again revived, though with a change of title, in the Lord Warden of the cinque Ports. Indeed, under all governments, the people of Kent have been especially confidered; as appears from their claim to the post of honour in our land-armies, and the privileges granted to their havens, in confideration of their undertaking the

> defence of our channel. As to the climate of this county, it varies according to the fituation of places. In the low flat lands, and especially in the marshes, the air is heavy, moift, and unhealthy; and yet not to fuch a degree as it has been sometimes represented; for, with a little care and caution, ftrangers, as well as natives, quickly reconcile their conflitutions to the temperature even of thefe parts, and live in them without much inconveniency or apparent danger. But, in reference to the rest of the country, the air is as thin, pure, and wholesome, as in any part of Britain. There is no region more happily or more beautifully diversified in regard to foil, fo that every kind thereof is, somewhere or other, to be met with in its bounds; and in no shire are any of these foils more fertile than they are in this. The Weald yields variety of fine timber, particularly of chefunt; the middle part has very rich arable land, annually bearing every species of grain in immense plenty, and these excellent in their several sorts. There are also many beautiful orchards, which produce a variety of fine fruits, and more especially apples and cherries, which were introduced here from Flanders by one Richard Harris, who was the king's fruiterer, in

Kent.

nowned for its meadows; and Rumney-marh has them that ingenuity and application for which they Kent hardly its equal. We may from this concile deferiphad been always diffinguished. These diligent and ac-Kentucky. tion very eafily collect, that the natural products of Kent are numerous, and of great value. In the bowels of the earth they find, in feveral places, a rough hard ferviceable stone for paving, which turns to some advantage; but not fo much as their exquifite fullersearth, rich marl, and fine chalk, which are there in abundance. If we except iron-ore, indeed, they have no mines; but there are prodigious heaps of copperas-flones thrown on the coast. The isle of Shepey, and all the adjacent shore as far as Reculver, is justly famous for its wheat. Thanet is in no less credit for its barley, or rather was fo; for now it produces, through the painful industry and skilful husbandry of its inhabitants, copious crops of good wheat as well as barley. Horses, black cattle, and sheep, they have in great numbers, and remarkable in point of fize; and hopgrounds in all parts of the county, which turn to very confiderable account. To which we may add, weld, or as fome call it dyers weed, which is a very profitable commodity, and of which there grows much in the neighbourbood of Canterbury; also madder, which is, or has been, occasionally cultivated. The rivers and fea-coasts abound with fish of different kinds. The excellency of its oysters on the eastern shore is celebrated by the Roman poets. Those of Feversham and Milton are not only in great esteem at the London market, but are likewife fent in great quantities

The many rich commodities produced in this coun-

ty, is the reason why most of our writers have reprefented it as in a manner void of manufactures; which, however, as appears upon a firict and impartial examination, is very far from being the cafe. Of iron works there were anciently many; and there are still fome, where kettles, bombs, bullets, cannon, and fuch like, are made. At Deptford Sir Nicholas Crifpe had in his life time a very famous copperas work; as, indeed, there that ingenious gentleman, one of the greatest improvers and one of the most public-spirited persons this nation ever bred, introduced several other inventions. Copperas was also formerly made, toge-. Philosoph. ther with brimstone, in the isle of Shepey *. But the original and for many ages the principal manufacture of this county was broad cloath of different colours, established chiefly at Cranbrook by King Edward III. who brought over Flemings to improve and perfect (the trade being introduced long before) his fubjects in that important art. At this and other places it flourished fo much, that even at the close of Queen Elifabeth's reign, and according to fome accounts much later, the best for home confumption, and the largest quantities for exportation, were wrought here; many fulling mills being erected upon almost every river, and the greatest plenty of excellent fullers-earth affording them fingular affiftance; infomuch that it is still a tradition, that the yeomanry of this county, for which it has been ever famous, were mostly the descendants of rich clothiers, who laid out the money acquired by their industry in the purchase of lands, which they transmitted, with their free and independant spirit, to their posterity. The duke of Alva's perfecution of the Protestants in the Low Countries drove a multitude of Walloons over hither, who brought with tive people fettled a manufactory of flannel or baize at Sandwich. By them the filk-looms were fet up at Canterbury, where they still subsist; and they also introduced the making of thread at Maidstone, where it yet remains, and merits more notice and encouragement than hitherto it has met with.

Upon the river Dart, at the confluence of which with the Thames stands the town of Dartford, was fet up, in the reign of Queen Elifabeth, the first mill for making white paper by Mr John Spilman, a German, upon whom, long after, King James conferred the honour of knighthood; but King Charles more fenfibly bestowed upon this Sir John Spilman a patent and a penfion of 200 l. a year, as a reward of his invention, and for the support of the manufacture. About the year 1590. Godfrey Box, a German, erected upon the fame river the first slitting-mill which was ever used for making iron-wire; and also the first battery-mill for making copper-plates. Other new inventions, requiring the affiftance of water, have been fet up on other streams; and a great variety of machines of this fort still subsist in different parts of this county. But these things are now so common, that it would be both tedious and ufeless to infift upon them. Amongst these, we may reckon the making gunpowder in several places. That manufacture, however, which is now the glory of this county, and indeed of Britain, is ship-building; more especially at the royal yards; as at Woolwich, which was fettled by Henry VIII. and fome confiderable ships built there. At prefent, there is not only a most complete establishment for the building and equipping men of war, a rope walk, foundery, and magazines; but also many private docks, in which prodigious bufiness is carried on, and multitudes of people are employed.

KENTISH-TOWN, a village of Middlesex, three miles north of London, near Hampstead, much improved of late by feveral handsome houses belonging to the citizens of London, &c. A new chapel has lately been erected here.

KENTUCKY, a province of North America, belonging at present to the state of Virginia, but proposed foon to be admitted into the union as an independent state. It is situated between 36° 30' and 39° 30' North Latitude, and 8° and 150 West Longitude ; being 250 miles in length, and 200 in breadth. It is bounded north-west by the river Ohio; west, by Cumberland river; fouth, by North Carolina; eaft, by Sandy river, and a line drawn due fouth from its fource till it strikes the northern boundary of North Carolina. Kentucky was originally divided into two counties, Lincoln and Jefferson. It has fince been fubdivided into feven, viz. Jefferson, Fayette, Bourbon, Mercer, Nelson, Maddison, Lincoln; and Lexington is the chief town.

The river Ohio washes the north-western side of Kentucky, in its whole extent. Its principal branches, which water this fertile tract of country, are Saudy, Licking, Kentucky, Salt, Green, and Cumberland rivers. These again branch into various directions, into rivulets of different magnitudes, fertilizing the country in all its parts. - There are five noted falt

Kentucky. forings or licks in this country, viz. the higher and lower established, besides several congregations where churches Kontucky.

The last of these licks, though in low order, has sup- other denominations. plied this country and Cumberland with falt at 20 shillings the bushel, Virginia currency; and some is exported to the Illinois country. The method of procuring water from these licks is by finking wells from 30 to 40 feet deep. The water drawn from these wells is more flrongly impregnated with falt than the water

from the fea.

This whole country, as far as has yet been difcovered, lies upon a bed of lime-stone, which in general is about fix feet below the furface, except in the valleys where the foil is much thinner. A tract of about 20 miles wide along the banks of the Ohio is hilly broken land, interspersed with many fertile spots. The rest of the country is agreeably uneven, gently ascendwill yield more and better tobacco .- The climate is and cold. Snow feldom falls deep or lies long. The winter, which begins about Christmas, is never longer than three months, and is commonly but two, and is fo mild as that cattle can fubfift without fodder.

It is impossible to ascertain with any degree of accuracy the prefent number of inhabitants, owing to the numerous accessions which are made almost every month. In 1783, in the county of Lincoln only, there were on the militia rolls 3570 men, chiefly emigrants from the lower parts of Virginia. In 1784 the num- dians at Wataga in March 1775, and then purchased her of inhabitants were reckoned at upwards of 30,000. from them the lands lying on the fouth fide of Ken-From the accounts of their attonishing increase fince, tucky river for goods at valuable rates, to the amount we may now fafely estimate them at 1,000,000. It is of 6000 l. specie. afferted that at least 20,000 migrated here in the year 1787. These people, collected from different states, of form a uniform and diftinguishing character. Among the fettlers there are many gentlemen of abilities, and many genteel families from feveral of the states, who give dignity and respectability to the settlement. They are in general more orderly perhaps than any people

who have fettled a new country.

> The legislature of Virginia have made provision for a college in Kentucky, and have endowed it with very confiderable landed funds. Schools are established in the feveral towns, and in general regularly and handfomely supported. They have a printing office, and publish a weekly gazette. They have erected a paper-mill, an oil mill, fulling mills, faw mills, and a great number of valuable grift mills. Their falt works are more than fufficient to fupply all the inhabitants at a low price. They make confiderable quantities of fugar from the fugar trees. Labourers, particularly

tradefmen, are exceedingly wanted here.

The first white man who discovered this province was one James M'Bride, in the year 1754. From ing and descending at no great distances. This counthis period it remained unexplored till about the year try in general is well timbered; and fuch is the variety 1767, when one John Finley and fome others, trading and beauty of the flowering shrubs and plants which with the Indians, fortunately travelled over the fertile grow spontaneously in it, that in the proper season the region now called Kentucky, then but known to the wilderness appears in blossom. The accounts of the Indians by the name of the Dark and Bloody Grounds, fertility of the foil in this country have in some in- and sometimes the Middle Ground. This country flances exceeded belief, and probably have been exag- greatly engaged Mr Finley's attention, and he comgerated. That some parts of Kentucky, particularly municated his discovery to Colonel Daniel Boon, and the high grounds, are remarkably good, all accounts a few more, who conceiving it to be an interesting obagree. The lands of the first rate are too rich for ject, agreed in the year 1769 to undertake a journey wheat, and will produce 50 and 60, and in some in- in order to explore it. After a long fatiguing march ostances it is affirmed 100 bushels of good corn an acre. ver a mountainous wilderness, in a wettward direction, In common the land will produce 30 bushels of wheat they at length arrived upon its borders; and from the or rve an acre. Barley, oats, cotton, flax, hemp, and top of an eminence, with joy and wonder descried the vegetables of all kinds common in this climate, yield beautiful landscape of Kentucky. Here they encampabundantly. The old Virginia planters fay, that if ed, and fome went to hunt provisions, which were the climate does not prove too moift, few foils known readily procured, there being plenty of game, while Colonel Boon and John Finley made a tour through healthy and delightful, fome few places in the neight the country, which they found far exceeding their exbourhood of ponds and low grounds excepted. The pectations; and returning to camp, informed their inhabitants do not experience the extremes of heat companions of their discoveries. But in spite of this promiting beginning, this company meeting with nothing but hardships and advertity, grew exceedingly disheartened, and was plundered, dispersed, and killed by the Indians, except Colonel Boon, who continued an inhabitant of the wilderness until the year 1771, when he returned home.

Colonel Henderson of North Carolina being informed of this country by Colonel Boon, he and fome other gentlemen held a treaty with the Cherokee In-

Soon after this purchase, the state of Virginia took the alarm, agreed to pay the money Colonel Donalddifferent manners, customs, religions, and political fon had contracted for, and then disputed Colonel fentiments, have not been long enough together to Henderson's right of purchase, as a private gentleman of another state in behalf of himself. However, for his eminent fervices to this country, and for having been instrumental in making so valuable an acquisition to Virginia, that state was pleased to reward him with a tract of land at the mouth of Green river, to the amount of 200,000 acres; and the state of North Carolina gave him the like quantity in Powel's Valley. fect in Kentucky. In 1789 they had 16 churches This region was formerly claimed by various tribes of Indians:

Rep'er. Indians : whose title, if they had any, originated in fuch a manner as to render it doubtful which ought to possess it. Hence this fertile spot became an object of contention, a theatre of war, from which it was properly denominated the Bloody Grounds. Their contentions not being likely to decide the right to any particular tribe, as foon as Mr Henderson and his friends proposed to purchase, the Indians agreed to fell; and notwithstanding the valuable consideration they received, have continued ever fince troublefome neighbours to the new fettlers.

The progress in improvements and cultivation which has been made in this country, almost exceeds belief. Eleven years ago Kentucky lay in forest, almost uninhabited but by wild beatts. Now, notwithstanding the united opposition of all the western Indians, she exhibits an extensive settlement, divided into seven large and populous counties, in which are a number of flourishing little towns, containing more inhabitants than are in Georgia, Delaware, or Rhode-Island states; and nearly or quite as many as in New Hamp-

KEPLER (John), one of the greatest astronomers of his age, was born at Wiel, in the country of Wirtemberg, in 1571. In the year 1595, he wrote an excellent book, which was printed at Tubingen the year following, under the title of Prodromus differtationum de proportione orbium calestium, deque causis calorum numeri, magnitudinis, motuumque periodicorum genuinis et propriis, &c. Tycho Brahe having fettled in Bohemia, and obtained from the emperor all forts of conveniencies for the perfecting of aftronomy, was fo paffionately defirous of having Kepler with him, and wrote fo many letters to him on that fubject, that he prevailed upon him to leave the university of Gratz, and remove into Bohemia with his family and library in the year 1600. Kepler in his journey was feized fo violently with the quartan ague, that he could not do Tycho Brahe all the fervices of which he was before capable. He was even a little disfatisfied with the refervedness which Tycho Brahe showed towards him; for the latter did not communicate to him all he knew; and as he died in 1601, he did not give time to Kepler to be very ufeful to him, or to receive any confiderable advantage under him. From that time Kepler enjoyed the title of Mathematician to the emperor all his life; and gained more and more reputation by his works. The emperor Rodolphus ordered him to finish the tables, of Tycho Brahe, which were to be called the Rodolphine Tables. Kepler applied himself to it vigorously: but unhappy are those learned men who depend upon the good-humour of the intendants of the finances. The treasurers were fo ill-affected toward our author, that he could not publish these tables till 1627. He died at Ratisbon, where he was foliciting the payment of the arrears of his penfion in 1630.

The principal works of this great aftronomer are, I. Prodromus differtationum above mentioned, to which he has also given the title of Mysterium Cosmographicum; which he efteemed more than any other of his works, and was for some time so charmed with it, that he faid he would not give up the honour of having invented what was contained in that book for the electorate of Saxony. 2. Harmonia mundi, with a defence of that

treatise. 3. De cometis, libri tres. 4. Epitome astro-Keratophy. nomie Copernicane. S. Alfronomia nova. 6. Chilias legarithmorum, Ec. 7. Nova flereometria dollorum vi-nariorum, Ec. 8. Dioptrice. 9. De vero natali anno Chrifti. 10. Ad Vitellionem Paralipomena, quibus Afronomia pars optica traditur, Sc. 11. Somnium Lunarifve Astronomia; in which he began to draw up that fystem of comparative astronomy which was afterwards purfued by Kircher, Huygens, and Gregory. Hisdeath happened while the work was printing; upon which James Bartfchius his fon-in-law undertook the care of the impression, but was also interrupted by death: and Lewis Kepler his fon, who was then a physician at Konigsberg in Prussia, was so much startled at these disasters, that it was with the utmost difficulty he could be prevailed upon to attempt to finish it, left it should prove fatal to him: he completed the task, however, without receiving any personal in-

KERATOPHYTUM, in natural history, a species of GORGONIA .- The keratophyta are called the frutices coralloides, or fea shrubs; and generally known among naturalists by the different appellations of litophyta, lithoxyla, and keratophyta; epithets tending to convey an idea of their composition, which at first view feems to confit partly of a woody or horny, partly of a thony or calcareous fubflance, variously disposed with respect to each other. Their general form approachesto that of shrubs, having a root-like base, by which they adhere to fome folid support in the ocean; and a ftem or trunk, and branches differently disposed; some riling up in one or more different twigs, subdivided into smaller and separate ramifications; while others have their smaller branches connected in such a manner, as to form a curious net-like structure : from this diverlity of figure they borrow the names of fea-fans, fea-feathers, &c. The feeming fibres of the bafe are. in reality, small tubes, of which the whole shrub confifts: thefe tubes run up longitudinally into the trunk. and are also circularly disposed about the centre of the trunk: the woody part, as naturalists have called it. thus formed, affords when burnt a strong smell like burning horn; whence fome have called it the horny part. Upon this part is superinduced a kind of stony or calcareous coat, which covers both trunk and branches to their extremities. In this coat may be discovered regular orders or pores of cells; and viewed by the microscope, it always appears to be an organical body confifting of a regular congeries, like the cells in which animals have been formed or existed. Some of this kind of bodies have loft their calcareous covering by the violence of the waves and other accidents. Infome specimens of an advanced growth, the calcareous tubes just mentioned fend out little cells of animals of the polype kind, with proper openings to them all : these cells are diffused along the branches in some regular order, much in the same manner as they are in the corallines. From the cells the animals have been discovered extending themselves, as well to procure food, as materials for the increase of this surprising flructure; and therefore there is no reason to doubt that they are animal productions.

A fmall sprig of the keratophyton stabelliforme, or warted fea-fan, is represented in Plate CCL. The outfide is covered with a crust full of little lumps-

Kerckring lumps like warts: which, when diffolved in vinegar, discover the contracted bodies of polypes, like claws. C and C1 are two views of one of the warts magnified; C2, is the appearance of the polype when the cretaceous matter is diffolved; C3, represents the particles that compose the incrustation, magnified .-D, represents a sea-willow, or keratophyton dichotomum. On both edges of the flat branches are regular rows of little rifing cells in the calcareous part, with fmall holes for an entrance to each. See

> KERCKRING (Theodore), a famous phyfician of the 17th century, was born at Amsterdam, and acquired a great reputation by his discoveries and his works. He found out the fecret of foftening amber without depriving it of its transparency; and made use of it in covering the bodies of curious infects in order to preferve them. He was a member of the Royal Society of London, and died in 1693 at Hamburg, where he had spent the greatest part of his life, with the title of resident of the grand duke of Tuscany. His principal works are, 1. Spicilegium anatomicum.
> 2. Anthropogeniæ ichnographia. There is also attributed to him an anatomical work, printed in 1671 in

> KERI CETIE, are various readings in the Hebrew Bible: keri, fignifies that which is read; and cetib, that which is written. For where any fuch various readings occur, the wrong reading is written in the text, and that is called the cetib; and the true reading is written in the margin, with p under it, and called the keri. It is generally faid by the Jewish writers, that these corrections were introduced by Ezra; but it is most probable, that they had their original from the mistakes of the transcribers after the time of Ezra, and the obfervations and corrections of the Masorites. Those Keri-cetibs, which are in the facred books written by Ezra himfelf, or which were taken into the canon after his time, could not have been noticed by Ezra himfelf; and this affords a prefumption, that the others are of late date. These words amount to about 1000; and Dr Kennicott, in his Differtatio Generalis, remarks, that all of them, excepting 14, have been found in the text of manuscripts.

KERMAN, the capital city of a province of that name in Persia, seated in E. Long. 56. 30. N. Lat. 30. 0. The province lies in the fouth part of Perfia, on the Persian gulph. The sheep of this country, towards the latter end of the spring, shed their wool, and become as naked as fuckling pigs. The principal revenue of the province confifts in these fleeces.

KERMES, in zoology, the name of an infect produced in the excrescences of a species of the oak. See Coccus.

KERMES Mineral, fo called from its colour, which refembles that of vegetable kermes, is one of the most important antimonial preparations, both with regard to its chemical phenomena and to its medicinal uses.

The use of kermes-mineral was not established in medicine before the beginning of this century. Some chemists, indeed, amongst others Glauber and Lemeri, had before that time mentioned in their works feveral preparations of antimony which approach more or less to kermes; but these preparations being little known, were confounded with many others which are entirely Nº 172.

neglected, although much praifed by their authors. - Kermes. The fame of kermes was occasioned by friar Simon, apothecary to the Chartreux friars. He received this preparation from a furgeon called La Ligerie, who had procured it from a German anothecary who had been a scholar of the famous Glauber. Friar Simon, from the commendations given to this new remedy by La Ligerie, administered it to a Chartreux friar, who was dangerously ill of a violent peripneumony, by which the friar was fuddenly, and as it had been miraculously, cured. From that time the friar apothecary published the virtue of his remedy. Several other remarkable cures were performed by means of kermes. The public believed in its medicinal qualities, and called it powder of Chartreux; because it was prepared only in the apothecary's shop belonging to these monks. The reputation of kermes extended itself more and more; till at length the duke of Orleans, then regent of France, procured the publication of the process by La Ligerie.

This process confists in boiling, during two hours, pulverised crude antimony in the fourth part of its weight of the liquor of nitre fixed by coals, and twice its weight of pure water: at the end of this time the liquor is to be decanted and filtrated, while boiling, through brown paper. It continues clear while it is boiling hot; but when it cools, it becomes turbid, acquires a red brick colour, and again becomes clear by the deposition of a red sediment, which is the kermes. The boiling may be thrice repeated, and each time the same quantity of water is to be added to the antimony, and a fourth part less of the liquor of fixed nitre. The feveral fediments from these three boilings are to be added together, washed with clean water till the water acquires no tafte; and the kermes is then to be dried. La Ligerie directs, that aquavitas shall be once or twice poured upon it and burnt, and

the kermes dried again.

We now proceed to explain the nature of kermes. and the phenomena of its preparation. --- Crude antimony is composed of regulus of antimony and common fulphur, united naturally with each other, as in almost all metallic minerals. The fixed alkali with which the crude antimony is boiled, although it is diluted with much water, acts upon the fulphur of the antimony, and forms with it liver of fulphur; and as this compound is a folvent of all metallic matters, it dissolves a certain quantity of the regulus of antimony. In this operation then a combination is formed of fixed alkali, of fulphur, and of regulus of antimony. Of these three substances the fixed alkali only is foluble in water, and is the intermediate fubstance by which the fulphur and regulus are suspended in the water. But we are to observe. that the alkali becomes impregnated by this operation, and by boiling, with a larger quantity of regulus, and especially of fulphur, than can be suspended in cold water; hence the decoction of kermes, which is clear, limpid, and colourless while boiling hot, becomes turbid and deposits a sediment while it cools. This compound, therefore, like certain falts, may be kept disfolved in larger quantity by hot than by cold water, and much of it is therefore deposited by cool-

Further, while the kermes is precipitating, the whole

Kermes, whole antimoniated liver of fulphur, which is diffolved containing a much larger proportion of alkali; fo that Kermes, by the boiling liquor, may be divided into two parts; one of which, that is the kermes, being overcharged with the regulus, and particularly with the fulphur, contains but a little alkali, which it draws along with it during its deposition. The other part, as it contains much more alkali, remains diffolved even in the cold liquor, by means of this larger quantity of al-Itali. All thefe propositions are to be explained and demonstrated by the following observations.

First, when the decoction of kermes is cold, and has formed all its fediment, if, without adding any thing to it, it be heated till it boil, it again entirely rediffolves the kermes; the fediment difappears; the liquor becomes clear, and by cold is again rendered turbid and deposites sediment as before. Thus the kermes may be made to precipitate and to rediffolve

as often as we pleafe.

Secondly, by digefting kermes in aqua regia, which diffolyes its alkali and regulus, the fulphur is feparated pure. The acids of aqua regia form a nitre and a febrifugal falt of Sylvius with the alkali of the kermes; and if a certain quantity of kermes be melted with black flux after having destroyed its fulphur by roafting, a true regulus of antimony may be obtained

These experiments, which were made by Mr Geoffroy, and the detail of which is found in memoirs given to the Academy in the years 1734 and 1735, upon the analysis of kermes, show evidently the prefence of fulphur, of fixed alkali, and of regulus of antimony, in this compound. From Mr Geoffroy's experiments we find, that 72 grains of kermes contain about 16 or 17 grains of regulus, 13 or 14 grains of alkaline falt, and 40 or 41 grains of common ful-

Thirdly, by repeating the boiling of the liquor upon the antimony, more and more kermes will be formed each time by cooling, as at first; and this experiment may be repeated a great many times. Mr Geoffroy fays, that he repeated it 78 times without any other addition than that of pure water to fupply that which was loft by evaporation; and that each time a confiderable quantity of kermes was formed by cooling. This experiment proves, that the alkali tranfforms the antimony into kermes by overcharging itfelf with regulus and fulphur, and at each precipitation the kermes does not retain and take with it but a very fmall quantity of alkali.

Fourthly, if any acid be poured upon the liquor in which the kermes has been formed, and from which it has been ertirely feparated by cooling, Mr Beaumè has obferved, that this liquor is again rendered turbid, and that a fecond fediment is formed of a yellow reddish colour, which is nothing elfe than golden fulphur of antimony; that is, regulus of antimony and fulphur mixed together, but in very different proportions, and with very different strengths of union, from those in which they are found in the crude antimony.

After this precipite ion, in the liquor a neutral falt is left, which is formed by the contained alkali and the precipitating acid. From this experiment we find, all fecretions and excretions, but particularly those of that in the liquor from which the kermes has been urine, fweat, and expectoration, according to the dofe. deposited, a considerable quantity of antimoniated li- to the nature of the disease, and to the disposition of ver of fulphur remains, which differs from kermes by the patient. It produces very good effects in those

Vol. IX. Part II.

it can keep dissolved the regulus and fulphur with which it is united, even when the liquor is cold.

In the process for feveral antimonial preparations, a kermes, or compounds like it, are formed. This always happens when crude antimony is treated by fufion with a quantity of alkaline falt, fo that an antimoniated liver of fulphur refults from it, overcharged with regulus and fulphur; that is, containing more of these two fubitances than it can keep diffolyed in cold water. If any of these combinations be boiled in water, a matter analogous to kermes is always deposited by cooling. This happens, for instance, to the fcoria of the regulus of antimony, and in an operation deferibed by Mr Geoffroy to abridge the process for ma-

To make kermes by fusion, Mr Geoffroy fuses two parts of antimony with one part of alkaline falt; he powders this matter while yet hot, and keeps it during two hours in boiling water; he then filtrates it, and receives the liquor into more boiling water, from which, when it cools, about fix gros of kermes is deposited, when an ounce of antimony has been used. This method of making kermes is much more expeditious, but less perfect; for, as the author confesses, the kermes produced is not so fine and soft as

that made in the ordinary method.

king kermes by fusion.

Mr Lemeri the elder mentions also, in his Treatise concerning Antimony, an operation from which his fon pretends that kermes may be obtained. This operation confifts in digefting, and afterwards boiling, powdered crude antimony in a very pure liquor of fixed nitre. This liquor, if it be in fufficient quantity. is capable of diffolving quickly and entirely powdered crude antimony; and we cannot doubt but that, by cooling, a confiderable quantity of a fubftance very analogous to kermes will be produced. Nevertheless, none of these short methods of making kermes is directed by difpensatories, or by the best books for describing the

preparations of chemical remedies. Kermes is used in medicine only; and from it fingularly excellent effects may be produced, when adminiftered by able physicians. In kermes are united the exciting and evacuant virtues of the emetic preparations of antimony, with the tonic, dividing, aperitive, and refolving properties of the liver of fulphur; that is to fay, that it is capable of answering two principal indications in the treatment of many acute and chronic difeafes. Properly managed, it may become an emetic, purgative, a diuretic, a sudorific, or an expectorant, as is required, and it is always attenuating and refolving. When feven or eight grains are taken at once, it chiefly acts upon the primæ viæ, generally as an emetic and as a purgative. A dose of three or four grains is feldom emetic, and more frequently purga-When taken in thefe quantities as an evacuant, a little of it passes also into the viæ fecundæ & tertiæ. When it is administered in fmaller dofes, it passes almost entirely into the lacteal, blood, and lymphatic vessels. In these it occasions such spasms and oscillations as it does in the primæ viæ; fo that it increases

difeafes

diseases of the breast which proceed from fullness and

Kermes may be administered in linctuses, in oily or in cordial potions, in any vehicle; or incorporated in a bolus, with other fuitable remedies. One precaution, hitherto little observed, is very necessary; that is, not to join it with acid matters, if it is intended to act as kermes. Anti-acid and abforbent substances ought to be joined with it, if the patient has an acid in the primæ viæ, or an acefcent disposition; for as these acids faturate the alkali by which the kermes is rendered an antimoniated liver of fulphur, and by which alone it differs from golden fulphur of antimony, they accordingly render the kermes entirely fimilar to the golden fulphur of antimony, the properties of which are very different from those of kermes.

KERN, or KERNE, a term in the ancient Irish militia, fignifying a foot-foldier .- Camden tells us, the armies of Ireland confifted of cavalry, called galloglafles; and infantry, lightly armed, called kernes .- The kernes bore fwords and darts; to the last were fitted cords, by which they could recover them after they

had been launched out.

KERNES, in our laws, fignify idle perfons or vaga-

KERRY, a county of Ireland, in the province of Munster, anciently called Corrigia, or "the rocky country," from Cerrig or Carric, " a rock." It is bounded by the Shannon which divides it from Clare on the north, by Limerick and Cork on the east, by another part of Cork on the fouth, and by the Atlantic Ocean on the west. The best town in it is Dingle, fituated in a bay of the same name. It comprehends a great part of the territory formerly called Defmond, and confifts of very different kinds of foil. The fouth parts are plain and fertile, but the north full of high mountains, which, though remarkably wild, produce a great number of natural curiolities. It contains 636,905 Irish plantation acres, 84 parishes, 8 baronies, 3 boroughs, returns 8 members to parliament, and gives title of earl to the family of Fitzmaurice. It is about 57 miles long, 45 broad, and lies within N. Lat. 51. 30. and 52. 24.; the Longitude at the mouth of Kenmare river being 100 35' west, or 42' 20" dif-ference of time with London. It is the fourth county as to extent in Ireland, and the fecond in this province : but in respect to inhabitants and culture doth not equal many fmaller counties. In it there are two epifcopal fees, which have been annexed to the bishopnic of Limerick fince the year 1660, viz. Ardfert and A hadoe. The fee of Ardfert was anciently called the diocefe of Kerry, and its bishops were named bishops of Kerry. Few mountains in Ireland can vie with those in this county for height; during the greater part of the year their fides are obscured by fogs, and it must be a very serene day when their tops appear. Iron ore is to be had in great plenty in most of the fouthern baronies. The principal rivers are the Blackwater, Feal, Gale and Brick, Cashin, Mang, Lea, Flesk, Laune, Carrin, Fartin, Inry, and Roughty, and the principal lake is Killarney. There are fome good medicinal waters discovered in this county; particularly Killarney water, Iveragh, Spa, Fellofwell, Dingle, Castlemain, and Tralee-Spas, as also a saline fpring at Maherybeg. Some rare and useful plants

grow in Kerry, of which Dr Smith gives a particular Kerfey account in his history of that county.

KERSEY, a kind of coarse woollen cloth, made, Kestrel.

chiefly in Kent and Devonshire.

KESITAH. This word is to be met with in Genefis and in Job, and is translated in the Septuagint and Vulgat " fheep or lambs:" But the Rabbins and modern interpreters are generally of opinion, that kefitah fignifies rather a piece of money. Bochart and Eugubinus are of opinion the Septuagint meant minæ, and not lambs; in Greek hecatonmnon, Exarovarar, instead of εκατον αμνών. Now a mina was worth 60 Hebrew shekels, and confequently 61. 16s. 10 d. Sterling. M. de Pelletier of Rouen is of opinion, that kesitah was a Persian coin, stamped on one side with an archer (Kesitah or Keseth in Hebrew fignifying "a bow") and on the other with a lamb; that this was a gold coin known in the east by the name of a darie, and was in value about 12 livres and 10 d. French money. Several learned men, without mentioning the value of the kefitah, fay it was a filver coin, the impression whereof was a sheep, for which reason the Septuagint and Vulgate translate it by this name. Calmet is of opinion, that kefitah was a purfe of gold or filver. In the east they reckon at present by purses. The word kifla in Chaldee fignifies " a measure, a veffel." And Eustathius says, that kista is a Persian measure. Jonathan and the Targum of Jerusalem translate kesitals "a pearl." (Gen. xxxiii. 19.; Job, xlii. 11). Or 91. English, supposing, as Dr Prideaux does, that a shekel is worth 3 s. A daric is a piece of gold, worth, as Dr Prideaux fays, 25 s. English.

KESSEL, a town of Upper Guelderland, in the Netherlands, with a handsome castle. It is the chief town in the territory of the fame name, and feated on the river Meufe, between Ruremond and Venlo, it being about five miles from each. It was ceded to the king of Prussia by the treaty of Utrecht. E. Long.

6. 13. N. Lat. 41. 22.

KESSEL (John Van), an eminent painter, was born at Antwerp in 1626, and became exceedingly famous for painting those particular objects which he delighted to reprefent; and not only excelled in fruits and flowers, but was likewife eminent for painting portraits. In this manner he refembled Velvet Brueghel, and very near equalled him in his birds, plants, and flowers. The prodigious high prices for which he fold his works, occasioned the rich alone to be the purchafers; and the king of Spain admired the performances of Van Keffel to fuch a degree, that he purchased as many of them as he could possibly procure, till at last he prevailed on that artift to vifit his court, where he was appointed painter to the queen, and was retained in her service as long as she lived. He painted portraits admirably, with a light free touch, and a tone of colour that very much refembled Vandyck; nor are his works in that style considered in Spain as inferior to that great master. He died in 1708, aged 82.

KESSELDORF, a village of Germany, in the circle of Upper Saxony, three miles below Drefden, remarkable for the battle gained by the king of Pruffia over the Saxons, on the 15th of December 1745.

KESTREL, the English name of a hawk, called also the fannel and the windhover, and by authors the tinnunculus and chencris. It builds with us in hollow Refwick hollow oaks, and feeds on partridges and other birds. See FALCO. Kettlewell.

KESWICK, a town of Cumberland, fituated on the fide of a lake in a fruitful plain, almost encompassed with mountains, called the Terwent Fells. It was formerly a town of good note, but now is much decayed. However, it is still noted for its mines and miners, who have a convenient finelting house on the fide of the river Derwent, the stream of which is fo managed as to make it work the bellows, hammers, and forge, as alfo to faw boards. There is a work-house here for employing the poor of this parish and that of Crossth-

wait. W. Long. 3. o. N. Lat. 54. 30.

KETCH, a veliel equipped with two masts, viz. the main-maft and mizen-maft, and ufually from 100 to 250 tons burden .- Ketches are principally used as yachts or as bomb-veffels; the former of which are employed to convey princes of the blood, ambaffadors, or other great perfonages, from one part to another; and the latter are used to bombard citadels, towns, or other fortreffes. The bomb-ketches are therefore furnished with all the apparatus necessary for a vigorous bombardment; they are built remarkably strong, as being fitted with a greater number of riders than any other veffel of war; and indeed this reinforcement is absolutely necessary to sustain the violent shock produced by the discharge of their mortars, which would otherwise in a very short time shatter them to

KETTLE, in the art of war, a term the Dutch give to a battery of mortars, because it is funk under

KETTLE-Drums, are formed of two large basins of copper or brass, rounded at the bottom, and covered over with vellum or goat-fkin, which is kept fast by a circle of iron, and by feveral holes fastened to the body of the drum, and a like number of fcrews to fcrew up and down, and a key for the purpose. The two basins are kept fast together by two straps of leather which go through two rings, and are fastened the one before and the other behind the pommel of the kettle-drums faddle. They have each a banner of filk or damask, richly embroidered with the sovereign's arms or with those of the colonel, and are fringed with filver or gold; and, to preferve them in bad weather, they have each a cover of leather. The drumflicks are of crab-tree or of any other hard wood, of eight or nine inches long, with two knobs on the ends, which beat the drum-head and cause the found. The kettle drum with trumpets is the most martial found of any. Each regiment of horse has a pair.

KETTLE-Drummer, a man on horseback appointed to beat the kettle-drums, from which he takes his name. He marches always at the head of the fquadron, and his post is on the right when the squadron is

drawn up.

KETTLEWELL (John), a learned divine, born in 1653, was descended from an ancient family in the North-riding of Yorkshire, bred in Edmund-Hall Oxford, and elected fellow of Lincoln-college. In 1675, he went into orders; but after the revolution was deprived of his living, on account of his refufal to take the oaths to King William and Queen Mary. He died of a confumption in 1695. He published several works, which were collected and reprinted together in 1718, in

2 vols folio. He was a man of great candour, meek-

ness, piety, and charity.

KEVELS, in thip-building, a frame composed of two pieces of timber, whose lower ends rest in a fort of step or foot, nailed to the ship's side, from whence the upper ends branch outward into arms or horns, ferving to belay the great ropes by which the bottoms of the main-fail and fore fail are extended.

KEW, a village of Surry in England, opposite to Old Brentford, 10 miles west from London. Here is a chapel of ease erected at the expence of several of the nobility and gentry in the neighbourhood, on a piece of ground that was given for that purpose by the late-Queen Anne. Here the late Mr Molineux fecretary to the late king, when prince of Wales, had a fine feat on the Green, which became the residence of the late prince and princess of Wales, who greatly improved both the house and gardens; now occupied by his present majefty, who has greatly enlarged the gardens, and formed a junction with them and Richmond gardens. The gardens of Kew are not very large, nor is their fituation by any means advantageous, as it is low and commands no prospects. Originally the ground was one continued dead flat; the foil was in general barren, and without either wood or water. With fo many difadvantages it was not eafy to produce any thing even tolerable in gardening ; but princely munificence, guided by a director equally skilled in cultivating the earth and in the politer arts, overcame all difficulties. What was once a defert is now an Eden. In 1758, an act paffed for building a bridge across the Thames to Kew-Green; and a bridge was built of elevenarches; the two piers and their dependant arches on each fide next the shore, built of brick and stone ; the intermediate arches entirely wood; the centre arch 50 feet wide, and the road over the bridge 30. But this bridge is to be taken down as foon as a very elegant one, now erecting close by it (1701), is completed

KEXHOLM, that part of Finland which borders upon Russia. The lake Ladoga crosses it, and divides it into two parts. By the treaty between Russia and Sweden in 1721, the Swedes were obliged to abandon the best part to the Russians. The country in general is full of lakes and marshes, thinly inhabited, and badly cultivated. The lake above mentioned is 120

miles in length, and full of fish.

KEXHOLM, or Carelgorod, a town of Ruffia, in a territory of the fame name, not very large, but well fortified, and has a strong castle. The houses are built with wood. It formerly belonged to the Ruffians, after which the Swedes had poffession of it for a whole century; but it was retaken by the Ruffians in 1710. Near it is a confiderable falmon-fishery. It is feated on two islands on the north-west side of the take Ladoga, in E. Long. 30. 25. N. Lat. 61. 12. Near it is another town called New Kenholm.

KEY, an instrument for the opening of locks.

See Lock.

L. Molinus has a treatife of keys, De clavibus veterum, printed at Upfal: he derives the Latin name clavis, from the Greek xxew claudo, " I shut;" or from the adverb clam " privately;" and adds, that the use of keys is yet unknown in fome parts of Sweden.

The invention of keys is owing to one Theodore of

Samos, according to Pliny and Polydore Virgil: but our term key or quay, the ground where they are made Keynsham, this must be a mistake, the use of keys having been known before the fiege of Troy; mention even feems made of them in the 10th chapter of Genefis.

Molinus is of opinion, that keys at first only ferved for the untying certain knots, wherewith they auciently fecured their doors: but the Laconic keys, he maintains, were nearly akin in use to our own; they confifted of three single teeth, and made the figure of an E; of which form there are still some to be seen in the cabinets of the curious.

There was another key called βαλαναγέα, made in the manner of a male-screw; which had its corresponding female in a bolt affixed to the door. Key is hence become a general name for feveral things ferving tothut up or close others. See the article LOCK.

KEY, or Key-flone, of an Arch or Vault, is the last stone placed a-top thereof; which being wider and fuller at the top than bottom, wedges, as it were, and binds all the reft. The key is different in the different orders : in the Tufcan and Doric it is a-plain stone only projecting; in the Ionic it is cut and waved fomewhat after the manner of confoles; in the Corinthian and Composite it is a console enriched with

fculpture, foliages, &c.

Key is also used for ecclefialtical jurisdiction; particularly for the power of excommunicating and abfolving. The Romanists fay, the pope has the power of the keys, and can open and shut Paradise as he pleafes; grounding their opinion on that expression of Jefus Chrift to Peter, "I will give thee the keys of the kingdom of heaven." In St Gregory we read, that it was the cultom heretofore for the popes to fend a golden key to princes, wherein they inclosed a little of the filings of St Peter's chains kept with a world of devotion at Rome; and that these keys were worn in the bosom, as being supposed to contain some wonderful virtues.

KEY is also used for an index or explanation of a cipher. See CIPHER.

Kers of an Organ, Harpfiehord, &c. those little pieces in the fore part of those instruments, by means whereof the jacks play, fo as to ftrike the ftrings. These are in number 28 or 29, In large organs there are feveral fets of the keys, fome to play the fecondary organ, fome for the main-body, fome for the trumpet, and fome for the echoing trumpet, &c.; in some there are but a part that play, and the rest are only for ornament. There are 20 flits in the large keys, which make half-notes. See the article ORGAN, &c.

KEY, in mufic, a certain fundamental note or tone, to which the whole piece, be it in cautata, fonata, concerto, &c. is accommodated, and with which it usually

begins but always ends.

KEY, or Quay, a long wharf, usually built of stone, by the fide of a harbour or river, and having feveral florehouses for the convenience of lading and difcharging merchant ships. It is accordingly furnished with pofts and rings, whereby they are fecured; together with cranes, capfterns, and other engines, to lift the goods into or out of the veffels which lie. along fide.

The verb cajare, in old writers, according to Scaliger, fignifies to keep in or restrain; and hence came

being bound in with planks and posts. KEYS are also certain funken rocks lying near

the furface of the water, particularly in the West-

KEYNSHAM, a town of Somerfetshire, 116 miles from London. It is a great thoroughfare in the lower road between Bath and Briftol. They call it proverbially (mosky Keynsham, and with equal reason they might call it foggy. It has a fine large church, a stone bridge of 15 arches over the Avon to Gloucestershire. and another over the river Chew. Its chief trade is malting. It has a charity-school, a weekly market. and three fairs.

KEYSER's PILLS, a celebrated mercurial medicine. the method of preparing which was purchased by the French government, and has fince been published by

M. Richard.

The first, and what, according to Mr Keyfer, is the most effential operation, consists in separating the mercury very exactly from all heterogeneous matter, by, reducing it to an athiops. This is effected by means of an hydraulic machine, a plan of which Mr Keyferintended to have given to government before his death :: but although he did not live to accomplish his resolution, his family fill offer to do it when defired. According to the description given by M. Richard, this machine confifts of a number of buckets, in which mercury is triturated with water, till the water acquires a black colour. This water, upon standing, deposits a fediment, which, being dried by a proper heat, is the æthiops required.

The fecond process confists in revivifying the mercury by distillation, in freeing it from all oily matters, by means of quick-lime, in detaching this quick-lime. by repeated washings, and afterwards in drying it by.

means of a fand heat.

The third operation confifts in the reduction of the mercury purified by this process to a red calx, by means of heat. In conducting this operation, Mr. Keyfer advifes, that the mercury be put into glass. matraffes, a fmall quantity only in each. For the proper degree of heat, he directs those who would practife the operation to confult Lemery and other chemifts.

The fourth operation is, the diffolution of the calcined mercury, obtained by the former process, in difilled vinegar, by means of triture. A pound of this. mercury may be diffolved in eight pints of vinegar, by rubbing it for an hour or two in a mortar, which should be kept folely for that purpose. Care must also be taken that the vinegar be not distilled in a metallic

but in a glass vessel.

The fifth process confilts in the intimate mixture of this vinegar, impregnated with mercury, with manna. Each pound of the vincgar containing about two ounces. of mercury, will require two pounds of manna. They must be rubbed, together upon marble stones till they acquire a uniform confiftence, which will be liquid to fuch a degree as to pass through a hair-cloth, for feparating the impurities of the manna. After being managed in this manner, it must be spread upon a marble flab, and left to dry there, without the affiftance of fire, till it acquires fuch a confidence as not to must then be placed before the fire, and at the same time moved from one part of the itone to another, by means of a knife, furnished with a large pliant blade. By this means, it is perfectly prepared for forming the pills.

The fixth and last process confits in the formation of the mass thus prepared into pills. These Mr Keyfer made to weigh either three grains or a grain and a half; the first for robust, the last for delicate consti-

tutions.

To this account given for the preparation of these pills, Mr Keyfer has added fome reflections, by way of supplement. He observes, that, by the purification of the mercury from diffillation, a great quantity. of heterogeneous matter is separated from it. This, however, by no means frees it completely from all foreign matter. And, as mercury purified, upon being calcined and diffolved in vegetable acid, is a much more powerful medicine than mercury calcined without purification, he concludes, that repeated purifica-

tions would render it ftill more active.

Another remark which he gives, respects the dissolution of the mercurius calcinatus in the diffilled vinegar. He observes, that the mercury thus dissolved may be made to unite with running mercury, and to form a very fingular product. He formerly mentioned, that a pound of this mercurius calcinatus was to be diffolved in eight pints of vinegar. If to this be added two pounds of running mercury, and the agitation continued, a fubflance will arise to the furface in the form of cream. This being removed by the affiftance of a wooden spoon, more will continue to rise as long as the agitation is continued. The cream being dried and incorporated with manna, in the proportion of one part of the cream to eight of manna, forms a very useful purgative, and is said to be an effectual remedy against recent venereal complaints, particularly against chancres.

with observing, that he considers it to be, without exception, the most effectual remedy for the venereal dif case hitherto discovered. But before entering upon the detail, he remarks, that it is his opinion the procefs may be much abridged, without diminishing the efficacy of the medicine. He judged it proper, however, to deliver to the public the method of preparing the pills in Mr Keyfer's own words; and he has not afterwards pointed out the improvements he pro-

KEYSLER (John George), a learned German antiquarian, was born at Thourneau in 1689. After studying at the university of Halle, he was appointed preceptor to Charles Maximilian and Christian Charles, the young counts of Giech Buchau; with whom he travelled through the chief cities of Germany, France, and the Netherlands, gaining great reputation among the learned as he went along, by illustrating feveral monuments of antiquity, particularly fome fragments of Celtic idols lately discovered in the cathedral of Paris. Having acquitted himfelf of this charge with great honour, he procured in 1716 the education of two grandfons of Baron Bernstorff first minister of state to his Britannic majesty as elector of Brunswick Lu-

Keyfer, run off upon the table being turned to its fide. It fit England, he was elected a fellow of the Roval So- Kiano ciety for a learned effay De Dea Nebelennia numine ve. Kiang Nan. terum Walachorum topico: he gave also an explanation of the ancient monument on Salisbury plain called Stone-henge, with A Differtation on the Confecrated Missetoe of the Druids. Which detached essays, with others of the fame kind, he published on his return to. Hanover, under the title of Antiquitates selecta Septentrionales et Celtica, &c. He afterwards made the grand tour with the young barons, and to this tour we owe: the publication of his travels; which were translated into English, and published in 1756, in 4 vols 4to. Mr Keysler on his return spent the remainder of his life under the patronage of his noble pupils, who committed their fine library and museum to his care, with a handsome income. He died in 1743.

KIAM, a great river of China, which takes its rife near the western frontier, crosses the whole kingdom castward, and falls into the bay or gulph of Nanking.

a little below that city.

KIANG-81, a province of China, bounded on the north by that of Kiang nan, on the well by Houquang, on the fouth by Quang-tong, and on the east by Fo-kien and Tche-kiang. The country is extremely fertile; but it is fo populous, that it can scarcely supply the wants of its inhabitants: on this account they are very economical; which exposes them to the farcasms and raillery of the Chinese of the other provinces: however, they are people of great folidity and acuteness, and have the talent of rising rapidly to the dignities of the state. The mountains are covered with fimples; and contain in their bowels mines of gold, filver, lead, iron, and tin : the rice it produces is very delicate, and feveral barks are loaded with it every year for the court. The porcelain made here is the finest and most valuable of the empire. This province contains 13 cities of the first class, and 78 of the fecond and third.

KIANG-Nan, a province of China, and one of the M. Richard concludes his account of Keyfer's pills. most fertile, commercial, and confequently one of the richest, in the empire. It is bounded on the west by the provinces of Ho nan and Hou quang ; on the fouth by Tche-kiang and Kiang-fi; and on the east by the gulph of Nanking; the reft borders on the province of Chan tong. The emperors long kept their court in this province; but reasons of state having obliged them to move nearer to Tartary, they made choice of Pe-king for the place of their refidence. This province is of vaft extent; it contains fourteen cities of the first class, and ninety-three of the second and third, These cities are very populous, and there is scarcely one of them which may not be called a place of trade. Large barks can go to them from all parts; because the whole country is interfected by lakes, rivers, and canals, which have a communication with the greatriver Yang-tfe-kiang, which runs through the middleof the province. Silk-stuffs, lacquer-ware, ink, paper, and in general every thing that comes from Nanking, as well as from the other citics of the province, are: much more effeemed, and fetch a higher price thanthose brought from the neighbouring provinces. In. the village of Chang-hai alone, and the villages dependent on it, there are reckoned to be more than 200,000 weavers of common cotton cloths. The manufacturing menburg. However, obtaining leave in 1718 to vi- of these cloths gives employment to the greater part of

Kidders

Kiel.

Kiburg the women .- In feveral places on the fea coast there are Avon, &c. which navigation, including its windings. found many falt-pits, the falt of which is distributed Kidder all over the empire. In fhort this province is fo abundant and opulent, that it brings every year into the emperor's treasury about 32,000,000 taels (or ounces of filver), exclusive of the duties upon every thing exported or imported. The people of this country are civil and ingenious, and acquire the fciences with great facility: hence many of them become eminent in literature, and rife to offices of importance by their abilities alone. This province is divided into two parts, each of which has a diffinct governor. The governor of the eastern part resides at Sou tcheou-fou, that of the western at Ngan-king-fou. Each of these gover-, river with a narrow cut in it, for the laying of pots nors has under his jurifdiction feven fou or cities of the first clafa.

KIBURG, a town of the canton of Zurich in Switzerland, with a caftle; feated on the river Theoff, in E. Long. 8. 50 N. Lat. 47. 20.

KID, in zoology, the name by which young goats

are called. See GOAT.

KIDDER (Dr Richard), a learned English bishop, was born in Suffex, and bred at Cambridge. In 1689, he was installed dean of Peterborough; and in 1691, was nominated to the bishopric of Bath and Wells, in the room of Dr Thomas Ken, who had been deprived for not taking the oaths to king William and queen Mary. He published, I. The young man's duty. 2. A demonstration of the Messiah, 3 vols 8vo. 3. A commentary on the five books of Moses, 2 vols 8vo; and feveral other pious and valuable tracts. He was killed with his lady in his bed by the fall of a flack of chimneys, at his house in Wells, during the great ftorm in 1703. The bishop, in the differtation prefixed to his commentary on the five books of Mofes, having reflected upon Monfieur Le Clerc, fome letters paffed between them in Latin, which are published by Le Clerc in his Bibliotheque Choifie.

KIDDERMINSTER, or KEDDERMINSTER, atown of Worcestershire, seated under a hill on the river Stour, not far from the Severn, 128 miles from London. It is a large town of 1180 houses, with about 6000 inhabitants, who carry on an extensive trade in weaving in various branches. In 1735 a carpet manufactory was established with fuccess, so as to employ in 1772 above 250 looms; and there are upwards of 700 looms employed in the filk and worfted. Above 1600 hands are employed as spinners, &c. in the carpet looms only in the town and neighbourhood; upwards of 1400 are employed in preparing yarn, which is used in different parts of England in carpeting; and it is supposed not looms in the town and neighbourhood. The filk manufacture was established in 1755. The town is remarkably healthy, and has also an extensive manufacture of quilting in the loom in imitation of Marfeilles quilting. Here is a Presbyterian meeting house; and they have a handsome church, two good free-schools, a charityschool, and two alms-houses, &c. The town is governed by a bailiff, 12 capital burgeffes, 25 common councilmen, &c. who have a town-hall. It formerly fent members to parliament. By the late inland navigation, it has communication by the junction of the Severn canal with the rivers Merfey, Dee, Rib-

extends above 500 miles, in the counties of Lincoln. Nottingham, York, Lancaster, Westmoreland, Chefter, Stafford, Warwick, Leicester, Oxford, Worcester, &c. This parish extends to Bewdley-bridge, has a weekly market, and three fairs. W. Long. 2, 15. N. Lat. 52. 28.

KIDDERS, those that badge or carry corn, dead victuals, or other merchandise, up and down to fell : every person being a common badger, kidder, lader, or carrier, &c. fays the flat. 5. Eliz. cap. 12. And

they are called kiddiers, 13 Eliz. cap. 25. KIDDLE, or KIDEL, (Kidellus), a dam or wear in a

or other engines to catch fish.

The word is ancient; for in Magna Charta, cap. 24. we read, Omnes kidelli deponantur per Thamefiam & Medweyam, & per totam Angliam, nifi per costeram maris. And by king John's charter, power was granted to the city of London, de kidellis amovendis per Thamefiam & Medweyam. A furvey was ordered to be made of the wears, mills, flanks, and kidells, in the great rivers of England, I Hen. IV. Fishermen of late corruptly call these dams kettles; and they are much used in Wales and on the sea-coalts of Kent.

KIDDINGTON, a town of Oxfordshire, four miles from Woodstock, and 12 from Oxford. It is fituated on the Glym river, which divides the parish in two parts, viz. Over and Nether Kiddington, in the latter of which stands the church. This parish was given by King Offa in 780 to Worcefter priory. Here King Ethelred had a palace; in the garden of the manor-house is an antique font brought from Edward the Confessor's chapel at Islip, wherein he received baptifm. In Hill-wood near this place is a Roman encampment in extraordinary prefervation, but little

KIDNAPPING, the forcible abduction or ftealing away of man, woman, or child, from their own country, and lending them into another. This crime was capital by the Jewish law: " He that stealeth a man and selleth him, or if he be found in his hand, shall furely be put to death*. So likewife in the civil law, + Exod. XXis the offence of spiriting away and stealing men and 16. children, which was called plagium, and the offenders plagiarii, was punished with death. This is unqueftionably a very heinous crime, as it robs the king of his subjects, banishes a man from his country, and may in its consequences be productive of the most cruel and difagreeable hardfhips; and therefore the common law of England has punished it with fine, imprisonment, lefs than 2000 are employed in the filk and worsted and pillory. And also the statute 11 and 12 W. III. c. 7. though principally intended against pirates, has a clause that extends to prevent the leaving of such persons abroad as are thus kidnapped or spirited away; by enacting, that if any captain of a merchant-veffel shall (during his being abroad) force any person on shore, or wilfully leave him behind, or refuse to bring home all fuch men as he carried out, if able and defirous to return, he shall fuffer three months imprison-

> KIDNEYS, in anatomy. See there, no 101. KIDNEY Bean See PHASEOLUS.

KIEL, a city of Germany, in the duchy of Holble, Oufe, Trent, Darwent, Severn, Humber, Thames, flein, in the circle of Lower Saxony, and the refidence

and a university founded in 1665; and there is a very celebrated fair held here. It is feated at the bottom of a bay of the Baltic Sea called Killerwick, at the mouth of the river Schwentin, in E. Long. 10. 17.

KIGGELARIA, in botany : A genus of the decandria order, belonging to the diocia class of plants; and in the natural method ranking under the 37th order, Columnifera. The male calyx is quinquepartite; the corolla pentapetalous; there are five trilobous glandules; the antheræ are perforated at top: the female calvx and corolla as in the male; there are five ftyles; the capfule unilocular, quinquevalved, and polyspermous. There is but one species, viz. the Africana. It hath an upright woody ftem, and purplish branches, growing 15 or 18 feet high; oblong, fawed, alternate leaves; and dioccious, greenish-white slowers, in clusters from the sides of the branches; succeeded by globular rough fruit, the fize of cherries, containing the feeds, which feldom ripen here. As this is a native of warm climates, it must be constantly kept in a stove in this country. It is propagated by seeds, layers, or cuttings, though most readily by feeds.

KIGHLEY, a town in the west riding of Yorkshire, fix miles to the fouth-east of Skipton in Craven. It stands in a valley surrounded with hills at the meeting of two brooks, which fall into the river Are one mile below it. Every family is supplied with water brought to or near their doors in stone troughs from a never-failing fpring on the west side of it. The parish is fix miles long and two broad, and is 60 miles from the east and west feas; yet at the west end of it near Camel-Cross is a rising ground, from which the springs on the east side of it run to the east sea, and those on the west to the west sea. By the late inland navigation, this town has a communication with the rivers Merfey, Dee, Ribble, Oufe, Trent, Darwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, Lancaster, Westmoreland, Chefter, Stafford, Warwick, Leicelter, Oxford, Worcester, &c.

KILARNEY. See KILLARNEY.

KILBEGGAN, a post, fair, and borough town of Ireland, in the county of Westmeath and province of Leinster, 44 miles from Dublin. It returns two members to parliament; patronage in the Lambert family. It is feated on the river Brofna, over which there is a bridge. There was here a monaftery founded in 1200, and dedicated to the Virgin Mary, and inhabited by monks from the Ciffertian abbey of Melefont. The fairs are two.

KILDA (S:), one of the Hebrides or western islands of Scotland. It lies in the Atlantic ocean, about 58. 30. N Lat.; and is about three English miles in length from east to west, and its breadth from fouth to north not less than two. The ground of St Kilda, like much the greatest part of that over all the Highlands, is much better calculated for pasture than tillage .- Reftrained by idlenels, a fault or vice much more pardonable here than in any other part of Great Britain, or discouraged by the form of government under which they live, the people of the island study

Riggelaria dence of the duke of Holftein Gottorp. It has a caftle, than to engage deeply in the more toilsome business of husbandry .- All the ground hitherto cultivated in this ifland lies round the village. The foil is thin, full of gravel, and of confequence very fharp. This, the' naturally poor, is, however, rendered extremely fertile, by the fingular industry of very judicious hufbandmen; these prepare and manure every inch of their ground, fo as to convert it into a kind of garden. All the instruments of agriculture they use, or indeed require, according to their fystem, are a spade, a mall, and a rake or harrow. After turning up the ground with a fpade, they rake or harrow it very carefully, removing every fmall stone, every noxious root or growing weed that falls in their way, and pound down every stiff clod into dust. It is certain that a fmall number of acres well prepared in St Kilda, in this manner, will yield more profit to the hufbandman than a much greater number when roughly handled in a hurry, as is the cafe in the other western isles. The people of St Kilda fow and reap much earlier than any of their neighbours on the western coast of Scotland. The heat of the fun, reflected from the hills and rocks into a low valley facing the fouth-cast, must in the fummer time be quite intenfe; and however rainy the climate is, the corn must for these reasons grow very fast and ripen early.

The harvest is commonly over at this place before the beginning of September; and should it fall out otherwife, the whole crop would be almost destroyed by the equinoctial storms. All the islanders on the western coast have great reason to dread the fury of autumnal tempests: these, together with the excessive quantities of rain they have generally throughout feven or eight months of the year, are undoubtedly the most disadvantageous and unhappy circumstances

of their lives.

Barley and oats are the only forts of grain known at St Kilda; nor does it feem calculated for any other. Fifty bolls of the former, old Highland measure, are every year brought from thence to Harris; and all the western islands hardly produce any thing so good of the kind. Potatoes have been introduced among that people only of late, and hitherto they have raised but fmall quantities of them. The only appearance of a garden in this whole land, fo the natives call their principal island in their own language, is no more than a very inconfiderable piece of ground, which is inclosed and planted with some cabbages. On the east fide of the island, at the distance of a quarter of a mile from the bay, lies the village, where the whole body of this little people (the number amounting in 1764 to no more than 88) live together like the inhabitants of a town or city. It is certain that the inhabitants were much more numerous formerly than at prefent; and the island, if under proper regulations, might eafily support 300 fouls. Martin, who vifited it about the end of the last century, found 180 perfons there; but about the year 1730, one of the people coming to the island of Harris, was seized with the fmall-pox and died. Unluckily his clothes were carried away by one of his relations next year; and thus was the infection communicated, which made fuch havock, that only four grown perfons were left alive. Their houses are built in two rows, regular, and facing one to rear up sheep, and to kill wild-fowl, much more another; with a tolerable causeway in the middle, which

contrived in a very uncommon manner. Every one of them is flat in the roof, or nearly fo, much like the houses of some oriental nations. That from any one of these the St Kildans have borrowed their manner of building, no man of fense will entertain a suspicion. They have been taught this leffon by their own reason, improved by experience. The place in which their lot has fallen is peculiarly subject to violent squalls and furious hurricanes: were their houses raised higher than at prefent, they believe the first winter-storm would bring them down about their ears. For this reason the precaution they take in giving them roofs much flatter than ordinary feems to be not altogether unneceffary. The walls of these habitations are made of a rough gritty kind of flones, huddled up together in hafte, without either lime or mortar, from eight to nine feet high. In the heart of the walls are the beds, which are overlaid with flags, and large enough to contain three persons. In the side of every bed is an opening, by way of door, which is much too narrow and low to answer that purpose. All their dwelling-houses are divided into two apartments by partition-walls. In the division next the door, which is much the largest, they have their cattle stalled during the whole winter feafon; the other ferves for kitchen, hall, and bed room.

It will be readily expected, that a race of men and women bred in St Kilda must be a very slovenly gemeration, and every way inelegant. It is indeed impossible to defend them from this imputation. Their method of preparing a fort of manure, to them indeed of vaft use, proves that they are very indelicate. After having burnt a confiderable quantity of dried turf, they foread the ashes with the nicest care over the floor of that apartment in which they eat and fleep. These ashes, so exactly laid out, they cover with a rich friable fort of earth; over this bed of earth they fcatter a proportionable heap of that dust into which peats are apt to crumble away: this done, they water, tread, and beat the whole compost into a hard floor, on which they immediately make new fires very large, and never extinguished till they have a sufficient stock of new ashes on hand. The same operations are repeated with a never-failing punctuality, till they are just ready to fow their barley; by that time the walls of their houfes are funk down, or, to speak more properly, the floors risen about four or five feet.

To have room enough for accumulating heaps of this compost one above another, the ancient St Kildians had ingenuity enough to contrive their beds within the linings of their walls; and it was for the fame reason they took care to raise these walls to an height far from being common in the other western islands. The manure produced in this way must undoubtedly be good; though probably rather sharp than of long duration, as it is scattered in small quantities upon the furface of the ground. Be that as it will, those who practice this art are abundantly lavish in its praises. They call it a commodity inestimably precious ; and one may venture to affirm, that a genuine St Kildian would fcruple to barter it away for all the diamonds in Brafil and Golconda.

It is certain that cleanliness must contribute greatly Nº 172.

they call the fireet. These habitations are made and to health, and of course longevity; but in spite of that Kilds. instance of indelicacy now given, and many more which might have been added, the people of this island are not more fhort-lived than other men. Their total want of those articles of luxury, which have fo natural a tendency to destroy the constitution of the human body, and their moderate exercises, will, together with some other circumstances, keep the balance of life equal enough between them and those who are absolute ftrangers to flovenlinefs.

Befides the dwelling-houses already described, there are a prodigious number of little cells difperfed over all the island; which confift entirely of stones, without any the smallest help of timber. These cells are from 12 to 18 feet in length, and a little more than feven in height. Their breadth at the foundation is nearly equal to the height. Every stone hangs above that immediately below, not perpendicularly, but inclines forward, fo as to be nearer the opposite side of the grotto, and thus by imperceptible degrees till the two highest courses are near enough to be covered by a fingle flag at the top. To hinder the rain from falling down between the interffices above, the upper part of the building is overlaid with turf, which looks like a fine green sward while new. The inhabitants fecure their peats, eggs, and wild-fowl, within thefe fmall repofitories: every St Kildian has his share of them, in proportion to the extent of land he poffesses, or the rent he pays to the steward. From the construction of these cells, and the toil they must have cost before they could have been finished, it seems plain, that those who put them together, were, if not more ingenious than their neighbours in the adjacent islands, at least more industrious than their own fuc-

The St Kilda method of catching wild-fowl is very entertaining. The men are divided into fowling-parties, each of which confifts generally of four persons diftinguished by their agility and skill. Each party must have at least one rope about 30 fathoms long; this rope is made out of a ftrong raw cow hide, falted for that very purpose, and cut circularly into three thougs all of equal length; thefe thongs being clofely twifted together, form a three-fold cord, able to fustain a great weight, and durable enough to last for about two generations: to prevent the injuries it would otherwise receive from the sharp edges of the rocks, against which they must frequently strike, the cord is lined with sheep-skins, dressed in much the same man-

This rope is a piece of furniture indispensably neceffary, and the most valuable implement a man of fubstance can be possessed of in St Kilda. In the teftament of a father, it makes the very first article in favour of his eldeft fon : should it happen to fall to a daughter's share, in default of male heirs, it is reckoned equal in value to the two best cows in the island.

By the help of fucli ropes, the people of the greatest prowess and experience here traverse and examine rocks prodigiously high. Linked together in couples, each having either end of the cord fastened about his waift, they go frequently through the most dreadful precipices: when one of the two defcends, his colleague plants himfelf on a strong shelf, and takes care

Kildare. to have such sure footing there, that if his fellow-adventurer makes a false step, and tumbles over, he may

be able to fave him.

The following anecdote of a fteward of St Kilda's deputy will give the reader a specimen of the dangers they undergo, and at the fame time of the uncommon ftrength of the St Kildians. This man, observing his colleague lofe his hold, and tumbling down from above, placed himfelf fo firmly upon the shelf where he flood, that he fuftained the weight of his friend, after falling the whole length of the rope. Undoubtedly thefe are stupendous adventures, and equal to any thing in the feats of chivalry. Mr Macaulay gives an instance of the dexterity of the inhabitants of St Kilda in catching wild-fowl, to which he was an eye-witnefs. Two noted heroes were drawn out from among all the ableft men of the community : one of them fixed himself on a craggy shelf; his companion went down 60 fathoms below him; and after having darted himself away from the face of a most alarming precipice hanging over the ocean, he began to play his gambols; he fung merrily, and laughed very heartily: after having performed feveral antic tricks, and given all the entertainment his art could afford, he returned in triumph, and full of his own merit, with a large ftring of fowls about his neck, and a number of eggs in his bosom. This method of fowling resembles that of the Norwegians, as described by bishop Pontoppi-

KILDARE, a town of Ireland, and capital of a county of the same name, is situated 28 miles southwest of Dublin. It returns two members to parliament, patron the duke of Leinster; and is governed by a fovereign, recorder, and two portrieves. The church of Kildare was very early erected into a cathedral with episcopal jurisdiction, which dignity it retains to this day; the cathedral, however, has been for feveral years neglected, and at prefent is almost in ruins. St Brigid founded a nunnery at Kildare, which afterwards came into the possession of the regular canons of St Augustin: this faint died 1st February 523, and was interred here; but her remains were afterwards removed to the cathedral church of Down. In the year 638, And Dubh or Black Hugh king of Leinster abdicated his throne, and took on him the Augustinian habit in this abbey; he was afterwards chofen abbot and bishop of Kildare, and died on the 10th May. In 756, Eiglitigin the abbot, who was also bishop of Kildare. was killed by a prieft as he was celebrating mass at the altar of St Brigid; fince which time no prieft whatfoever was allowed to celebrate mass in that church in the presence of a bishop. In 1220 Henry de Loundres archbishop of Dublin put out the fire called inextinguishable, which had been preserved from a very early time by the nuns of St Brigid. This fire was however relighted, and continued to burn till the total suppression of monasteries. Here was also a Grey abbey on the fouth fide of the town, erected for friars of the Franciscan order, or, as they were more generally called, Grey friars, in the year 1260, by Lord William de Vesey; but the building was completed by Gerald Fitzmaurice, Lord Offaley. A confiderable part of this building yet remains, which appears not to have been of very great extent. A house for white friars was likewife founded in this town by William de Vol. IX. Part II. .

Vefey in 1290; the round tower here is 130 feet high, Kildare built of white granite to about 12 feet above the Kilianus. ground, and the rest of common blue stone. The pedeftal of an old cross is still to be seen here; and the upper part of a cross lies near it on the ground .- Fairs are held here on 12th February, Eafter Tuefday, 12th May, and 19th September. The fairs held here are

KILDARE, a county of Ireland, in the province of Leinster, which is 37 miles in length and 20 in breadth; and is bounded on the east by Dublin and Wicklow, on the west by King and Queen's county, on the north by East-Meath, and on the fouth by Catherlogh. It is a fine arable country, well watered by the Barrow, Liffey, and other rivers, and well inhabited and cultivated, containing 228,590 Irish plantation acres, 100 parishes, 10 baronies, 4 boroughs, and returns 10 members to parliament. The chief town is of the same name, and gave title of earl to the noble family of Fitzgerald. It was anciently called Chilledair, i. e. " the wood of oaks," from a large forest which comprehended the middle part of this county : in the centre of this wood was a large plain. facred to heathen superstition, and at present called the Curragh of Kildare: at the extremity of this plain, about the commencement of the 6th century, St Brigid, one of the heathen vestals, on her conversion to the Christian faith, founded, with the affiftance of St Conlæth, a church and monastery, near which, after the manner of the Pagans, St Brigid kept the facred fire in a cell, the ruins of which are still visible.

KILDERKIN, a liquid measure, containing two

KILIAN (Lucas), an eminent engraver, was a native of Augiburg in Germany, and flourished at the beginning of the 17th century. In what school he learned the art is uncertain; but his ftyle of engraving bears no fmall refemblance in many particulars to that of Henry Goltzius, and of John Muller his difciple. It appears, however, that he went to Italy in order to complete his studies, where he engraved feveral plates from the pictures of the great Italian mafters. According to Mr Strutt, few artifts have manifested a greater command of the graver than Kilian, whether we confider the facility with which the strokes are turned upon each other, or the firmness with which they are executed; and one cannot help admiring it, though it evidently strikes us, that by paying too close attention to this part of the art, he neglected the correctness of his outlines, and fatigued the lights with unnecessary wor'; by which means he broke the maffes, and often totally destroyed the effect of his prints. The naked parts of the human figure are feldom well expressed; the extremities especially are in general very heavy, and sometimes incorrect. Upon the works of this mafter, however, it appears, that Balechou, fo famous for his skill in handling of the graver, formed his tafte. His works are exceedingly numerous. The time of his death is not any where mentioned .- There were feveral other engravers of the fame name and family; but of too inferior merit to deferve particular notice.

KILIANUS (Cornelius), a native of Brabant, diflinguished himself as an excellent corrector of the press at the printing house of Plantin for 50 years.

Kilkenny He likewife wrote feveral books which are effected, towers which have fo much engaged the attention of Kilkenny.

KILKENNY, a county of Ireland, in the province of Leinster, bounded on the fouth by the county of Waterford, on the north by the Queen's county, on the west by the county of Tipperary, on the east by the counties of Wexford and Catherlogh, and on the porth-west by Upper Offory. The greatest length of breadth from east to west 18; and it contains to baronies. It is one of the most healthful, pleasant, and populous counties of Ireland. It contains 287.650 Irish plantation acres, 96 parishes, 9 baronies, and 7 boroughs, and returns 16 members to parliament. Gilbert Clare, Earl of Gloucester and Hereford, marrying Isabella, one of the daughters and co-heirestes of William earl Marshal, received as her dower the county

of Kilkenny. KILKENNY, the capital of a county of the fame name in Ireland, fituated in the province of Leinster, 57 miles fouth west of Dublin. It takes its name from the cell or church of Canic, who was an eminent hermit in this country : and is one of the most elegant cities in the kingdom. It is the feat of the bishop of Offory, which was translated from Agabo in Offory, about the end of Henry II.d's reign, by bishop O'Dullany. The city is pleafantly fituated on the Neor, a navigable river that discharges itself into the harbour of Waterford. It is faid of Kilkenny, that its air is without fog, its water without mud, its fire without fmoke, and its-ftreets paved with marble. The two latter are indeed matter of fact; for they have in the neighbourhood a kind of coal that burns from first to last without smoke, and pretty much resembles the Welsh coal. Most of the streets also are actually paved with a very good fort of black marble; of which they have large quarries near the town, which takes a fine polish, and is beautifully intermixed with white granite. The air too is good and healthy, though not remarkably clearer than in many other parts of the kingdom. The city is governed by a mayor, re-corder, aldermen, and sheriffs. It comprises two towns, viz. Kilkenny fo called, and Irish-town, each of which fends two members to parliament, and both together are computed to contain about 20,000 inhabitants. This city was once of great consequence, as may be feen by the venerable ruins yet remaining of churches, monasteries, and abbeys, which even now in their dilapidated flate exhibit fuch specimens of exquisite tafte in architecture as may vie with any modern improvements; and the remains of its gates, towers, and walls, show it to have been a place of great Brength. Here too at different times parliaments were held, in which fome remarkable statutes were passed. It has two churches, and several catholic chapels; barracks for a troop of horse and four companies of foot; a market is held twice in the week, and there are feven fairs in the year .- Irish-town is more properly called the borough of St Canice, vulgarly Kenny; the patronage of which is in the bishop of Offory. The cathedral, which stands in a fequestered situation, is a venerable Gothic pile, built above 500 years; and close to it is one of those remarkable round

His Apology for Correctors against Authors, an epi- travellers. The bishop's palace is a handsome building, gram of 18 verfes, is a proof of his abilities in Latin and communicates by a covered passage with the church. The castle was first built in 1195, on the fite of one destroyed by the Irish in 1173. The situation in a military view was most eligible: the ground was originally a conoid, the elliptical fide abrupt and precipitous, with the river running rapidly at its base: here the natural rampart was faced with a wall of folid mafonry 40 feet high; the other parts were defended by this county from north to fouth is 38 miles, the baftions, curtains, towers, and outworks; and on the fummit the calle was erected. This place, as it now stands, was built by the ancestors of the dukes of Ormond: here the Ormond family refided; and it is now in the possession of Mr Butler, a descendant of that illustrious race. The college originally founded by the Ormond family is rebuilt in a ftyle of elegance and convenience. The tholfel and market-house are both good buildings; and over the latter is a fuit of rooms. in which, during the winter and at races and affizes times, affemblies are held. There are two very fine bridges of cut marble over the Nore; Johu's Bridge particularly is light and elegant. The Ormond family built and endowed a free school in this city. Here are the ruins of three old monasteries, called St John's, St Francis's, and the Black abbey: belonging to the latter are the remains of feveral old monuments, almost buried in the ruins; and the courts of the others. are converted into barracks. The manufactures chiefly carried on here are, coarfe woollen cloths, blankets of extraordinary fine quality, and confiderable quantities of flarch. In the neighbourhood also are made very beautiful chimney-pieces of that species of stone already mentioned, called Kilkenny marble: they are cut and polished by water, a mill for that purpose (the only one of its kind perhaps in Europe) being invented by the late Mr Colles. The Kilkenny coal-pits are within nine miles of the town. This city came by marriage into the ancient family of Le Despencer. It was incorporated by charter from King James I. in The market-crofs of Kilkenny continued an 1600. ornament to the city until 1771, when it was taken down; the date on it was MCCC. Sir James Ware mentions Bishop Cantwell's rebuilding the great bridge of Kilkenny, thrown down by an inundation about the year 1447. It appears also that St John's bridge fell down by a great flood in 1564; and on 2d October 1763, by another like circumstance, Green's bridge near the cathedral fell .- The borough of St Canice, or Irish-town, always enjoyed very ancient prescriptive rights. A close roll of 5 Edward III. A. D. 1376, forbids the magistrates of Kilkenny to obstruct the sale of victuals in the market of Irish-town, or within the cross, under the pretence of custom for murage a and left the ample grants made to Kilkenny might be interpreted fo as to include Irish-town, the corporation of the latter fecured their ancient rights by letterspatent 15 Edward IV. A. D. 1474. These renew their former privileges, and appoint a portrieve to be chosen every 21st September, and sworn into office on the 11th October. The portrieve's prison was at Troy-gate. Whenever the mayor of Kilkenny came within Water-gate, he dropt down the point of the city-fword, to show he claimed no pre-eminence within the borough.

KILLALOE.

Willalon.

KILLALOE, a bishop's fee in the county of riety of forms by the waves, and the trees and shrubs Killarney. Killarney. Clare and province of Munster, in Ireland, 86 miles from Dublin, otherwife Lounia. It was anciently written Kill-da-Lua, i. e. "the church of Lua," from Lua, or Molua, who about the beginning of the 6th century founded an abbey near this place. St Molua appears to have derived his name from Loania, the place of his refidence, as was customary amongst the ancient Irish. On the death of St Molua, St Flannan his disciple, and son of the chief of the district, was confecrated bishop of this place at Rome about the year 639, and the church endowed with confiderable estates by his father Theodorick. Towards the close of the 12th century, the ancient fee of Rofcrea was united to that of Killaloe; from which period thefe united bishoprics have been governed by the same bishops. At Killaloe is a bridge over the Shannon of 10 arches; and here is a confiderable falmon and eel fishery. There are many ancient buildings in and about this town. 'I'he cathedral is a Gothic edifice in form of a crofs, with the steeple in the centre, supported by four arches; it was built by Donald king of Limerick in 1160. There is a building near it, once the oratory of St Molua; and there is another of the fame kind in an island on the Shannon, having marks of still higher antiquity. The fee house of the bishop is at Clarisford, near to Killaloe. Adjoining to the cathedral are yet some remains of the mausoleum of Brien Boru.

KILLARNEY, a post-town of Ireland in the county of Kerry and province of Munster, seated near a fine lake called Lough Lean, or Lake of Killarney. It is diffant 143 miles from Dublin, and has two fairs. Within a mile and a half of this place are the ruins of the cathedral of Aghadoe, an ancient bishoprick united to Ardfert; and within four miles the ruins of Aglish church. At this town is the seat and gardens of lord Kenmore.

The beautiful lake of Killarney is divided properly into three parts, called the lower, middle, and upper lake. The northern or lower lake is fix miles in length and from three to four in breadth, and the town is fituated on its northern shore. The country on this and the eastern boundary is rather of a tame character; but is here and there diversified with gentle swells, many of which afford delightful prospects of the lake, the islands, and furrounding scenery. The southern shore is composed of immense mountains, rifing abruptly from the water, and covered with woods of the finest timber. From the centre of the lake the view of this range is aftonishingly sublime, presenting to the eye an extent of forest fix miles in length, and from half a mile to a mile and a half in breadth, hanging in a robe of rich luxuriance on the fides of two mountains, whose bare tops rising above the whole form a perfect contrast to the verdure of the lower region. On the fide of one of these mountains is O'Sullivan's cafcade, which falls into the lake with a roar that strikes the timid with awe on approaching it. The view of this sheet of water is uncommonly fine, appearing as if it were descending from an arch of wood, which overhangs it about 70 feet in height from the point of view. Coasting along this shore affords an almost endlefs entertainment, every change of polition prefenting a new scene; the rocks hollowed and worn into a vaburfting from the pores of the fapless ftone, forced to affume the most uncouth shapes to adapt themselves to their fantastic fituations. The islands are not fo numerous in this as in the upper lake; but there is one of uncommon beauty, viz. Innisfallen, nearly opposite to O'Sullivan's cascade: It contains 18 Irish acres. The coast is formed into a variety of bays and promontories, skirted and crowned with arbutus, holly, and other shrubs and trees; the interior parts are diversified with hills, and dales, and gentle declivities, on which every tree and fhrub appears to advantage: the foil is rich even to exuberance; and trees of the largest fize incline across the vales, forming natural arches, with ivy entwining in the branches, and hanging in festoons of foliage. The promontory of Mucrufs, which divides the upper from the lower lake, is a perfect land of enchantment; there is a road carried through the centre of the promontory, which unfolds all the interior beauties of the place. Amongst the distant mountains, Turk appears an object of magnificence; and Mangerton's loftier, though less interesting summit, rears itself above the whole. The passage to the upper lake is round the extremity of Mucrufs, which confines it on one fide, and the approaching mountains on the other. Here is the celebrated rock called the eagle's neft, which produces wonderful echoes. A French horn founded here, raifes a concert superior to 100 instruments; and the report of a single cannon is answered by a succession of peals refembling the loudest thunder, which feems to travel the furrounding fcenery, and die away among the distant mountains. The upper lake is four miles in length, and from two to three in breadth; and is almost surrounded by mountains, from which descend a number of beautiful cascades. The islands in this lake are numerous, and afford an amazing variety of picturefque views .- The centre lake, which communicates with the upper, is but fmall in comparison with the other two, and cannot boast of equal variety. The shores, however, are in many places indented with beautiful bays, furrounded with dark groves of trees, some of which have a most picturesque appearance when viewed from the water. The eastern boundary is formed by the base of Mangerton, down the steep side of which descends a cascade visible for 150 yards: this fall of water is supplied by a circular lake near the fummit of the mountain, called the Devil's Punch Bowl; which, on account of its im-mense depth, and the continual overslow of water, is confidered as one of the greatest curiofities in Killarney .- Mr Smith feems to think, that one of the best prospects this admired lake affords, is from a rifing ground near the ruined cathedral of Aghadoe.

The lake of Killarney is otherwise called Lough Lane, or Loch Lean, from its being furrounded by high mountains. Nennius fays, that these lakes were encompaffed by four circles of mines; the first of tin, the fecond of lead, the third of iron, and the fourth of copper. In the feveral mountains adjacent to the lakes are still to be feen the vestiges of the ancient mines of iron, lead, and copper; but tin has not as yet been discovered here. Silver and gold are faid by the Irish antiquaries to have been found in the early ages: but this is fomewhat doubtful, especially in any confiderable quantity, though fome filver probably was

Killas, extracted from the lead ore, and fmall quantities of gold might have been obtained from the vellow copper ore of Mucruss. However, in the neighbourhood of thefe lakes were found in the early ages, as well as at prefent, pebbles of feveral colours, which taking a beautiful polish, the ancient Irish wore in their ears, girdles, and different articles of their drefs and furni-

> KILLAS, a genus of stones belonging to the argillaceous class, found chiefly in Cornwall in England. Its texture is either lamellar or coarfely granular; the specific gravity from 2630 to 2666. It contains 60 parts of filiceous earth, 25 of argillaceous, 9 of magnefia, and 6 of iron. The greenish kind contains more iron, and gives a green tincture to the nitrous acid.

> KILLICRANKIE, a noted pass of Perthshire in Scotland. It is formed by the lofty mountains impending over the water of Garrie, which rushes through in a deep, darkfome, and horrid channel, beneath. In the last century this was a pass of much danger and difficulty; a path hanging over a tremendous precipice threatened destruction to the least falfe flep of the traveller; at prefent a fine road formed by the foldiery lent by government, and encouraged by an additional 6 d. per day, gives an eafy access to the remote Highlands; and the two fides are joined by a

> Near the north end of this pass, in its open and unimproved flate, was fought in the year 1680 the battle of Killicranky, between the adherents of James II, under Viscount Dundee, and of William III, under General Mackay. Dundee's army was very much inferior to that of Mackay's. When he came in fight of the latter, he found them formed in eight battalious ready for action. They confifted of 4500 foot, and two troops of horfe. The Highlanders under Dun-dee amounted to little more than half that number. Thefe he ranged inflantly in order of battle. Maclean, with his tribe, formed the right wing. The Macdonalds of Sky, under their chieftain's eldest son, formed the left. The Camerons, the Macdonald's of Glengary, the followers of Clanronald, and a few Irish auxiliaries, were in the centre. A troop of horse were placed behind under Sir William Wallace. The officers fent by James from Ireland were distributed through all the line. His whole army flood in fight of the enemy for feveral hours on the fleep fide of a hill, which faced the narrow plain where Mackay had formed his line. Dundee wished for the approach of night; a feason fuited for either victory or flight.

At five of the clock in the afternoon, a kind of flight skirmish began between the right wing of the Highlanders and the left of the enemy. But neither army wishing to change their ground, the firing was discontinued for three hours. Dundee in the mean time flew from tribe to tribe, and animated them to action. At eight of the clock he gave the fignal for battle, and charged the enemy in person at the head of the horse. The Highlanders in deep columns rushed fuddenly down the hill. They kept their that till they were within a pike's length of the enemy; and having fired their muskets, fell upon them sword in hand. Mackay's left wing could not for a moment sustain the thock. They were driven by the Macleans with great

flaughter from the field. The Macdonalds on the left Killigrew. of the Highlanders were not equally fuccefsful. Colonel Haltings' regiment of foot stood their ground. They even forced the Macdonald's to retreat. Maclean, with a few of his tribe, and Sir Evan Cameron at the head of his clan, fell fuddenly on the flank of this gallant regiment, and forced them to give way. The flaughter ended not with the battle. Two thoufand fell in the field and the flight. The tents, baygage, artillery, and provisions of the enemy, and even king William's Dutch standard, which was carried by Mackay's regiment, fell into the hands of the Highlanders. The victory was now complete. But the Highlanders loft their gallant leader. Perceiving the unexpected refiltance of Colonel Hastings' regiment, and the confusion of the Macdonald's, Dundee rode rapidly to the left wing. As he was railing his arm, and pointing to the Cameron's to advance, he received a ball in his fide. The wound proved mortal; and with Dundee fell all the hopes of king James at that

KILLIGREW (William), eldeft fon of Sir Robert Killigrew knight, was born in 1605. He was gentleman-usher of the privy-chamber to king Charles I. and on the restoration to Charles II. When the latter married the princess Catharine of Portugal, he was created vice-chamberlain; in which station he continued 22 years, and died in 1603. He was the author of four plays, which, though now thrown afide, were much applauded by the poets of that time, particularly by Mr Waller; and in the decline of life he published fome pious reflections on the instability of human happiness, when our views are not directed to a future state.

KILLIGREW (Thomas), brother of the former, was born in 1611; and in process of time diftinguished himself by his uncommon natural parts. He was page of honour to King Charles I. and groom of the bed-chamber to Charles II. with whom he fuffered many years exile; during which he applied his leifute hours to the fludy of poetry, and to the composition of feveral plays. After the reftoration he continued in high favour with the king, and had frequently access to him when he was denied to the first peers in the realm; and being a man of great wit and liveliness of parts, and having from his long intimacy with that monarch, and being continually about his person during his troubles, acquired a freedom and familiarity with him, which even the pomp of majesty afterwards could not check in him, he fometimes, by way of jeft, which King Charles was ever fond of, if genuine, even though himself was the object of the satire, would adventure bold truths which fcarcely any one befides would have dared even to hint at. One story in particular is related of him, which if true is a ftrong proof of the great lengths he would fometimes proceed in his freedoms of this kind, which is as follows :--When the king's unbounded passion for women had given his mistrefs such an ascendant over him, that, like the effeminate Persian monarch, he was much fitter to have handled a distaff than to wield a sceptre, and for the converfation of his concubines utterly neglected the most important affairs of state, Mr Killigrew went to pay his majetty a vifit in his private apartments, habited like a pilgrim who was bent on a long journey.

Killigrew, The king, surprised at the oddity of his appearance, ships lie sheltered from all winds; in the town are some Killough. killileagh, immediately afked him what was the meaning of it, good houses, a decent market house, a horse barrack, and whither he was going? "To hell," bluntly replied the wag. "Prithee (faid the king), what can your errand be to that place?" "To fetch back Oliver Cromwell (rejoined he), that he may take fome care of the affairs of England, for his successor takes none at all."-One more flory is related of him, which is not barren of humour. King Charles's fondness for pleafure, to which he almost always made business give way. used frequently to delay affairs of consequence, from his majefly's disappointing the council of his presence when met for the dispatch of business, which neglect gave great difgust and offence to many of those who were treated with this feeming difrespect. On one of these occasions the duke of Lauderdale, who was naturally impetuous and turbulent, quitted the council-chamber in a violent passion; and meeting Mr Killigrew prefently after, expressed himself on the occasion in very difrespectful terms of his majesty. Killigrew begged his grace to moderate his passion, and offered to lay him a wager of 100l. that he himfelf would prevail on his majesty to come to council in half an hour. The duke, furprifed at the boldness of the affertion, and warmed by his refentment against the king, accepted the wager; on which Killigrew immediately went to the king, and without ceremony told him what had happened; adding these words, "I know that your majetty hates Lauderdale, though the necessity of your affairs compels you to carry an outward appearance of civility: now, if you choose to get rid of a man who is thus difagreeable to you, you need only go this once to council: for I know his covetous disposition so perfectly, that I am well perfuaded, rather than pay this 100 l. he would hang himself out of the way, and never plague you more." The king was so pleased with the archness of this observation, that he immediately replied, "Well then, Killigrew, I positively will go;" and kept his word accordingly .- Killigrew died in 1682, and was buried in Westminster-abbev.

KILLIGREW (Anne), "a Grace for beauty, and a Muse for wit," as Mr Wood says, was the daughter of Dr Henry Killigrew, brother of the two foregoing, and was born a little before the restoration. She gave early indications of genius, and became eminent in the arts both of poetry and painting. She drew the duke of York and his duchels to whom the was maid of honour, as well as feveral other portraits and history-pieces: and crowned all her other accomplishments with unblemished virtue and exemplary piety. Mr Dryden feems quite lavish in her praise, though Wood affures us he has faid no more of her than the was equal if not superior to. This amiable young woman died of the fmall-pox in 1685; and the year after her poems were published in a thin 4to volume.

KILLILEAGH, a town of Ireland, in the county of Down and province of Ulfter, 80 miles from Dublin; otherwise written Killyleagh. It is the principal town in the barony of Duffrin; and feated on an arm of the lake of Strangford, from which it is supplied with a great variety of 6th. The family of the Hamiltons created first Lords Clanbois, and afterwards Earls of Clanbraffil, had their feat and residence here in a caffle flanding at the upper end of the great fireet;

and a Presbyterian meeting-house. On an eminence a fmall diffance from the town is a handsome church built in the form of a cross. This place suffered much in the calamitous year 1641. It is now thriving, and the linen manufacture carried on in it, and fine thread made, for which it has a great demand. It returns two members to parliament, patronage in the Blackwood family; and holds three fairs. The celebrated naturalist and eminent physician Sir Hans Sloan was born here 16th April 1660, and his father Alexander Sloan was at the head of that colony of Scots which King James I. fettled in the place. This town was incorporated by that king at the inflance of the first earl of

KILLOUGH (otherwise PORT ST ARNE), aporttown of Ireland, fituated in the county of Down and province of Uliter, 76 miles from Dublin. It lies north of St John's Point, and has a good quay, where thips lie very fafe. The town is agreeably fituated; the fea flowing all along the banks of the houses, where ships ride in full view of the inhabitants. There is here a good church, and a horse barrack. They have good fishing in the bay; but the principal trade of the place confilts in the exportation of barley, and the importation of such commodities as are confumed in the adjacent country. A manufacture of falt is also carried on with great advantage. The fairs held here are five. At a small distance from the town is a charter working-school for the reception of 20 children, which was fet on foot by the late Mr Jullice Ward. There is a remarkable well here called St Scordin's well, and highly effeemed for the extraordinary lightnels of its water. It guihes out of a high rocky bank, close upon the shore, and is observed never to diminish its quantity in the drieft feafon. There is also a mineral fpring near the school, the waters of which the inhabitants affirm to be both purgative and emetic. At a fmall distance from the town near the sea is a rock in which there is an oblong hole, from whence at the ebbing and flowing of the tide a ftrange noise is heard fomewhat refembling the found of a huntiman's horn. In an open field about a quarter of a mile from the town towards St John's point there is a very curious cave, which has a winding paffage two feet and an half broad, with three doors in it belides the entrance, and leading to a circular chamber three yards in diameter, where there is a fine limpid well. The cave is about 27 yards long.

KILLOUGH Harbour is tolerably fafe and commodious; a fmall degree of caution, however, is necessary in failing into it; for a rock stands in the middle of the entrance, covered at half flood, commonly called the water-rock. Either to the east or west of this rock is a fecure paffage, the inlet lying fouth by east and north by west. On the west side of the rock open to Coney-island is a strong quay, and a bason for ships, where they are defended from all winds, within which the harbour on both fides affords good anchorage for veffels of 150 tons. At the end of the quay the channel is 400 yards wide. The bay of Killough is form. ed by Rin fad at the Long-point to the cast, and St John's point to the west, as the inner harbour is by a at the lower end of the firet is a little fafe bay, where peninfula called Coney-ifle from the number of rabbits Killybegs thereon, and not Cane-iffe as Sir William Petty has it. the late earl, who, by engaging in the rebellion of 1745, Kilmore An impetuous fea runs on all this coast in storms and Kilmar. fpring tides. nock.

KILLYBEGS, a borough and fair town in the county of Donegal and province of Ulfter, 123 miles from Dublin. It is fituated on the north fide of Donegal bay; but is a place of no great trade, though it has a harbour spacious enough to contain a large fleet: it has a bold and ample opening to the fea on the fouth, and is fecured within by the shelter of high lands furrounding it; fo that veffels may enter at any time of the tide, there being from 5 to 8 fathom water. The herring fishery is the most considerable of any carried on here; but the town is likely to in- church on the fite of that founded by St Fedlimid, to crease in trade and consequence. It returns two members to parliament, patronage in the Connyngham family. It has two fairs.

KILMAINHAM, a town of Ireland, fituated about half a mile from Dublin. It has a feffion-house and handfome gaol; and here the quarter fessions are held for the county of Dublin, and knights of the shire elected for that county. This place was fometimes the feat of government before Dublin castle was converted to that burpose; and though now much decayed. it gives title of baron to the family of Wenman. An ancient priory was founded here, and a house for knights hospitalers of St John of Jerusalem.

KILMALLOCK, a town of Ireland, in the county of Limerick and province of Munfter, 16 miles from the city of Limerick, and 107 from Dublin .-This town makes a conspicuous figure in the military history of Ireland. In the 16th century it was a populous place; and the remains of the wall, which entirely furrounded the town, and of feveral large houses, are still to be feen. Edward VI. granted a charter to it with many privileges, as did Queen Elizabeth another, dated 24th April 1584. In 1598, it was invested by the Irish forces, when the earl of Ormond hastened to its relief, and arrived in time to raife the fiege: here was also some contest during the grand rebellion in 1641 and 1642. By an inquisition 11 Aug. 29 Eliz. it appears that there had been an abbey in Kilmallock called Flacifpaghe; on which a stone house was erected. In the cathedral church are the remains of a monument erected over the Verdon family, one of whom represented this town in parliament in 1613. Kilmallock returns two members to parliament; patron Silver Oliver, Efq. This place once gave title of viscount to one of the Sarsfield family. Sir James Ware informs us, that an abbey of Dominicans or black friars was built here in the 13th century by the fovereign, brethren, and commonalty. From the many ruins here of castles and ancient buildings, it has acquired the name of the Irifh Balbeck. The parish church was formerly an abbey for regular canons founded by St Mochoallog, who died between the years 639 and 656; and some writers say, that the Dominican abbey just mentioned was founded in 1291, by Gilbert the second son of John of Calleen. Fairs are held at this town on Whitfun-Tuefday.

KILMARNOCK, a populous and flourishing town of Ayrshire in Scotland, noted for its manufacture of carpets, milled hofiery, and Scotch bonnets. It gave the title of earl to the noble family of Boyd, refiding in this neighbourhood. This title was forfeited by

was deprived of his honours, and loft his life on the fcaffold. His fon, however, who ferved in the king's army, afterwards succeeded to the earldom of Errol, a title much more ancient and honourable.

KILMORE, a bishop's see in the county of Cavan and province of Ulster in Ireland. It was called in former ages Clunes, or Clunis, i. e. the "fequestered place;" and is fituated near Loch Ern. St Fedlimid founded this bishopric in the fixth century; it was afterwards removed to an obscure village called Triburna; where it continued until the year 1454, when Andrew Mac Brady bishop of Triburna erected a whose memory it was dedicated, and denominated Kilmore or "the great church." At prefent there are neither cathedral, chapter, nor canons, belonging to this fee; the fmall parish church contiguous to the epifcopal house ferving for the purpose of a cathedral.

KILN, a stove used in the manufacture of various articles. A fabric formed for admitting heat, in order to dry or burn materials placed in it to undergo fuch operations.

KILWORTH, a town of Ireland, fituated in the county of Cork and province of Munfter, 108 miles from Dublin. It is a thriving place, with a good church, at the foot of a large ridge of mountains called Kilworth mountains, through which a good turnpike road is carried from Dublin to Cork : below the town runs the river Funcheon, which is well flored with falmon and trout, and discharges itself a mile south of this into the Blackwater. Near Kilworth is a good glebe and vicarage house. At this place is Moorpark, the fuperb feat of Lord Mountcashel: and adjoining to his lordship's improvements stands the castle of Clough-leagh, boldly fituated on the river Funcheon, which has flood feveral fieges. Six fairs are held here.

KIMBOLTON, a town of Huntingdonshire, seated in a bottom; and noted for the castle of Kimbolton. the feat of the duke of Manchester. W. Long. 0. 15. N. Lat. 52. 18.

KIMCHI (David), a Tewish rabbi, famous as a commentator co the Old Testament, lived at the close of the 12th and beginning of the 13th centuries. He was a Spaniard by birth, fon of rabbi Joseph Kimchi, and brother of rabbi Mofes Kimchi, both men of eminent learning among the Jews: but he exceeded them both, being the best Hebrew grammarian the Jews ever had. He wrote a Grammar and Dictionary of that language; out of the former of which Buxtorf made his Thefaurus lingua Hebrea, and his Lexicon lingua Hebrea out of the latter. His writings have been held in such estimation among the Iews, that no one can arrive at any reputation in letters and theology without fludying them.

KINCARDINESHIRE. See MEARNS.

KINDRED, in law, persons related to one another, whereof the law reckons three degrees or lines, viz. the descending, ascending, and collateral line. See CONSANGUINITY and DESCENT.

On there being no kindred in the descending line, the inheritance paffes in the collateral one.

KING, a monarch or potentate who rules fingly and fovereignly

King. fovereignly over a people, Camden derives the word is protected by the laws; he has great prerogatives, King. from the Saxon cyning, which fignifies the same; and that from can " power," or ken "knowledge," wherewith every monarch is supposed to be invested. The Latin rex, the Scythian reix, the Punic refeh, the Spanish rey, and French roy, come all, according to Poflel, from the Hebrew שאד, rosch, " chief, head."

Kings were not known amongst the Israelites till the reign of Saul. Before him they were governed at first by elders as in Egypt; then by princes of God's appointment, as Mofes and Joshua; then by judges till the time of Samuel; and last of all by kings. See

Most of the Grecian states were governed at first by kings, who were chosen by the people to decide differences and execute a power which was limited by laws. They commanded armies, prefided over the worship of the Gods, &c. This royalty was generally hereditary; but if the vices of the heir to the crown were odious to the people, or if the oracle had fo commanded, he was cut off from the right of fuccession; yet the kings were supposed to hold their sovereignty by the appointment of Jupiter. The enhan of majefty was the fceptre, which was made of wood adorned with fluds of gold, and ornamented at the top with fome figure; commonly that of an eagle, as being the bird of Jove.

Rome also was governed at first by kings, who were elected by the people, with the approbation of the fenate and concurrence of the augurs. Their power extended to religion, the revenues, the army, and the administration of justice. The monarchical form of government subsisted 244 years in Rome, under seven kings, the last of whom was Tarquinius Superbus. See

ROME.

Among the Greeks the king of Persia had anciently the appellation of the great king; the king of France now has that of the most Christian king; and the king of Spain has that of Catholic king. The king of the Romans is a prince chosen by the emperor, as a coad-

jutor in the government of the empire.

The kings of England, by the Lateran council, under Pope Julius II. had the title of Christianissimus conferred on them; and that of defender of the faith was added by pope Leo X. though it had been used by them some time before. The title of grace was first given to our kings about the time of Henry IV. and that of majefly first to Henry VIII. before which time our kings were called grace, highness, &c .- In all pub lic inftruments and letters, the king flyles himfelf nos "we;" though till the time of king John he spoke in

the fingular number.

the general acceptation of the term. It will not there- and despotically regal, which is introduced by conquest fore frictly apply to the fovereign of Britain; and and violence, and a political or civil monarchy, which fill lefs of late to that of France, formerly one of the arises from mutual consent (of which last species he most absolute, now the most degraded, of princes, afferts the government of England to be), immediately without power and without consequence. In Britain, lays it down as a principle, that "the king of England a happy mean prevails. The power of the king is must rule his people according to the decrees of the indeed subject to great limitations: but they are the laws thereof; infomuch that he is bound by an oath limitations of wifdom, and the fources of dignity; at his coronation to the observance and keeping of his being fo far from diminishing his honour, that they own laws." But to obviate all doubts and difficulties add a glory to his crown: For while other kings are concerning this matter, it is expressly declared by staabsolute monarchs over innumerable multitudes of tute 12 and 13 W. III. c. 2. "that the laws of Engflaves, the king of Britain has the diffinguished glo- land are the birthright of the people thereof; and all ry of governing a free people, the leaft of whom the kings and queens who shall ascend the throne of

and a boundless power in doing good; and is at the fame time only restrained from acting inconsistently with his own happiness, and that of his people.

To understand the royal rights and authority in Britain, we must consider the king under six distinct views. 1. With regard to his title. 2. His royal family. 3. His councils. 4. His duties. 5. His prerogative.

6. His revenue.

I. His title. For this, fee HEREDITARY Right, and SUCCESSION.

II. His royal family. See Royal Family.

III. His councils. See Council.

IV. His duties. By our constitution, there are certain duties incumbent on the king; in confideration of which, his dignity and prerogative are established by the laws of the land : it being a maxim in the law, that protection and subjection are reciprocal. And thefe reciprocal duties are what Sir William Black. ftone apprehends were meant by the convention in 1688, when they declared that king James had broken the original contract between king and people. But however, as the terms of that original contract were in some measure disputed, being alleged to exist principally in theory, and to be only deducible by reason and the rules of natural law, in which deduction different understandings might very considerably differ; it was, after the revolution, judged proper to declare these duties expressly, and to reduce that contract to a plain certainty. So that, whatever doubts might be formerly raifed by weak and ferupulous minds about the existence of such an original contract, they must now entirely cease; especially with regard to every prince who hath reigned fince the year 1688. The principal duty of the king is, To govern his

people according to law. Nec regibus infinita aut libera poteflas, was the conflitution of our German ancestorson the continent. And this is not only confonant to the principles of nature, of liberty, of reason, and of fociety; but has always been efteemed an express part of the common law of England, even when pre-rogative was at the highest. "The king (faith Bracton, who wrote under Henry III.) ought not to be fubject to man; but to God, and to the law: for the law maketh the king. Let the king therefore render to the law, what the law has invested in him with regard to others; dominion, and power: for he is not truly king, where will and pleafure rules, and not the law." And again: "The king hath a fuperior, namely God; and also the law, by which he was made a king." Thus Bracton; and Fortescue also, having The definition of king above given, is according to first well distinguished between a monarchy absolutely

King. this realm ought to administer the government of the fame according to the faid laws, and all their officers and ministers ought to serve them respectively according to the fame : and therefore all the other laws and flatutes of this realm, for fecuring the eftablished religion, and the rights and liberties of the people thereof, and all other laws and ftatutes of the fame now in force, are by his majefty, by and with the advice and confent of the lords spiritual and temporal, and commons, and by authority of the same, ratified and confirmed accordingly."

And as to the terms of the original contract between king and people, thefe, it is apprehended, are now couched in the coronation-oath, which by the statute 1 W. & M. st. 1. c. 6. is to be administered to every king and queen who shall succeed to the imperial crown of these realms, by one of the archbisheps or bishops of the realm, in the presence of all the people; who on their parts do reciprocally take the oath of allegiance to the crown. This coronation-

oath is conceived in the following terms:

" The archbifbop or bifbop fball fay, Will you folemnly promife and fwear to govern the people of this kingdom of Britain, and the dominions thereto belonging, according to the statutes in parliament agreed, and the laws and customs of the same?-The king or queen shall fay, I folemnly promife fo

" Archbishop or bishop. Will you to your power cause law and justice, in mercy, to be executed in all

your judgments ?- King or queen. I will.

" Archbishop or bishop. Will you to the utmost of your power maintain the laws of God, the true profeftion of the gospel, and the Protestant reformed religion established by the law? And will you preserve unto the bishops and clergy of this realm, and to the churches committed to their charge, all fuch rights and privileges as by law do or shall appertain unto them, or any of them ?- King or queen. All this I promife to do.

" After this the king or queen, laying his or her hand upon the boly gospel, shall fay, The things which I have here before promised, I will perform and keep : so help

me God. And then fhall kifs the book."

This is the form of the coronation-oath, as it is now prescribed by our laws; the principal articles of which appear to be at least as ancient as the Mirror of Justices, and even as the time of Bracton: but the wording of it was changed at the revolution, because (as the flatute alleges) the oath itself had been framed in doubtful words and expressions, with relation to ancient laws and conflitutions at this time unknown. However, in what form foever it be conceived, this is most indisputably a fundamental and original express contract; though, doubtless, the duty of protection is impliedly as much incumbent on the fovereign before coronation as after: in the fame manner as allegiance to the king becomes the duty of the fubject immediately on the descent of the crown, before he has taken the oath of allegiance, or whether he ever takes it at all. This reciprocal duty of the subject will be confidered in its proper place. At prefent we are only to observe, that in the king's part of this original contract are expressed all the duties which a monarch can owe to his people, viz. to govern according to

law; to execute judgment in mercy; and to maintain King. the established religion. And with respect to the latter of these three branches, we may farther remark, that by the act of union, & Ann. c. 8. two preceding flatutes are recited and confirmed; the one of the parliament of Scotland, the other of the parliament of England: which enact; the former, that every king at his accession shall take and subscribe an oath, to preferve the Protestant religion, and presbyterian churchgovernment in Scotland; the latter, that at his coronation he shall take and subscribe a similar oath, to preferve the fettlement of the church of England within England, Ireland, Wales, and Berwick, and the territories thereunto belonging.

V. His prerogative. See PREROGATIVE. VI. His revenue. See REVENUE.

Having in the preceding articles chalked out all the principal outlines of this vast title of the law, the fupreme executive magistrate, or the king's majesty, confidered in his feveral capacities and points of view; it may not be improper to take a thort comparative review of the power of the executive magistrate, or prerogative of the crown, as it stood in former days, and as it flands at prefent. And we cannot but observe, that most of the laws for afcertaining, limiting, and reftraining this prerogative, thave been made within the compass of little more than a century past; from the petition of right in 3 Car. I. to the present time. So that the powers of the crown are now to all appearance greatly curtailed and diminished since the reign of king James I. particularly by the abolition of the starchamber and high-commission courts in the reign of Charles I. and by the disclaiming of martial law, and the power of levying taxes on the subject, by the same prince : by the difuse of forest laws for a century patt : and by the many excellent provisions enacted under Charles II.; especially the abolition of military tenures, purveyance, and pre-emption; the babeas corpus act; and the act to prevent the discontinuance of parliaments for above three years; and fince the revolution, by the strong and emphatical words in which our liberties are afferted in the bill of rights, and act of fettlement ; by the act for triennial, fince turned inco septennial elections; by the exclusion of certain officers from the house of commons ; by rendering the feats of the judges permanent, and their falaries independent; and by reftraining the king's pardon from obstructing parliamentary impeachments. Besides all this, if we confider how the crown is impoverished and ftripped of all its ancient revenues, fo that it greatly depends on the liberality of parliament for its necessary fupport and maintenance, we may perhaps be led to think that the balance is inclined pretty ftrongly to the popular scale, and that the executive magistrate has neither independence nor power enough left, to form that check upon the lords and commons which the founders of our constitution intended.

But, on the other hand, it is to be considered, that every prince, in the first parliament after his accession, has by long usage a truly royal addition to his hereditary revenue fettled upon him for his life; and has nevery any occasion to apply to parliament for supplies, but upon fome public necessity of the whole realm. This reftores to him that conflitutional independence, which at his first accession seems, it must be owned, to

may find perhaps that the hands of government are at least sufficiently strengthened; and that a British monarch is now in no danger of being overborne by either the nobility or the people. The inftruments of power are not perhaps to open and avowed as they formerly were, and therefore are the less liable to jealous and invidious reflections ; but they are not the weaker upon that account. In fhort, our national debt and taxes (besides the inconveniences before mentioned). have also in their natural consequences thrown such a weight of power into the executive scale of government, as we cannot think was intended by our patriot ancestors; who gloriously struggled for the abolition of the then formidable parts of the prerogative, and by an unaccountable want of forefight established this fyftem in their flead. The entire collection and management of fo vast a revenue, being placed in the hands of the crown, have given rife to fuch a number of new officers, created by and removeable at the royal pleafure, that they have extended the influence of government to every corner of the nation. Witness the commissioners, and the multitude of dependents on the cultoms, in every port of the kingdom; the commiffioners of excise, and their numerous subalterns, in every inland diffrict; the post masters and their servants, planted in every town, and upon every public road; the commissioners of the stamps, and their diftributors, which are fully as scattered and fully as numerous; the officers of the falt duty, which, though a species of excise, and conducted in the same manner, are yet made a distinct corps from the ordinary managers of that revenue; the furveyors of houses and windows: the receivers of the land-tax; the managers of lotteries; and the commissioners of hackney-coaches; all which are either mediately or immediately appointed by the crown, and removable at pleafure without any reason assigned: these, it requires but little penetration to fee, must give that power, on which they depend for subliftence, an influence most amazingly extenfive. To this may be added the frequent opportunities of conferring particular obligations, by preference in loans, fubscriptions, tickets, remittances, and other money-transactions, which will greatly increase this influence; and that over those persons whose attachment, on account of their wealth, is frequently the most desirable. All this is the natural, though perhaps the unforeseen, consequence of erecting our funds of credit, and, to support them, establishing our perpetual taxes: the whole of which is entirely new fince the reftoration in 1660; and by far the greatest part fince the revolution in 1688. And the fame may be faid with regard to the officers in our numerous army, and, the places which the army has created. All which put together give the executive power so perfuafive an energy with respect to the persons themfelves, and so prevailing an interest with their friends and families, as will amply make amends for the lofs of external prerogative.

But though this profusion of offices should have no effect on individuals, there is ftill another newly acquired branch of power; and that is, not the influence only, but the force of a disciplined army: paid indeed ultimately by the people, but immediately by

Vol. IX. Part II.

King. be wanting. And then with regard to power, we crown, commanded by the crown. They are kept on King. foot, it is true, only from year to year, and that by the power of parliament : but during that year, they must by the nature of our conflictation, if raised at all, be at the absolute disposal of the crown. And there need but few words to demonstrate how great a trust is thereby reposed in the prince by his people : A trust that is more than equivalent to a thousand little troublesome prerogatives.

Add to all this, that besides the civil lift, the immenfe revenue of almost feven millions sterling, which is annually paid to the creditors of the public, or carried to the finking fund, is first deposited in the royal exchequer, and thence iffued out to the respective offices of payment. This revenue the people can never refuse to raise, because it is made perpetual by act of parliament; which also, when well considered, wiil appear to be a trust of great delicacy and high importance.

Upon the whole, therefore, it feems clear, that whatever may have become of the nominal, the real power of the crown has not been too far weakened by any transactions in the last century. Much is indeed given up; but much is also acquired. The stern commands of prerogative have yielded to the milder voice of influence: the flavish and exploded doctrine of non-refistance has given way to a military establishment by law; and to the difuse of parliaments has succeeded a parliamentary trust of an immense perpetual revenue. When, indeed, by the free operation of the finking fund, our national debts shall be lessened; when the posture of foreign affairs, and the universal introduction of a well planned and national militia, will fuffet our formidable army to be thinned and regulated; and when (in confequence of all) our taxes shall be gradually reduced; this adventitious power of the crown will flowly and imperceptibly diminish, as it slowly and imperceptibly rofe. But till that shall happen, it will be our especial duty, as good subjects and good Englishmen, to reverence the crown, and yet guard against corrupt and servile influences from those who are intrusted with its authority; to be loyal, yet free; obedient, and yet independent; and above every thing, to hope that we may long, very long, continue to be governed by a fovereign, who, in all those public acts that have personally proceeded from himself, hath manifefted the highest veneration for the free constitution of Britain; hath already in more than one instance remarkably strengthened its outworks; and will therefore never harbour a thought, or adopt a perfuafion. in any the remotest degree detrimental to public li-

King at Arms, or of Arms, is an officer of great antiquity, and anciently of great authority, whose business is to direct the heralds, preside at their chapters; and have the jurisdiction of armoury.

In England there are three kings of arms, viz. garter, clarencieux, and norroy.

Garter, principal King at Arms, was instituted by Henry V. His business is to attend the knights of the garter at their assemblies, to marshal the solemnities at the funerals of the highest nobility, and to carry the garter to kings and princes beyond the fea; on which occasion he used to be joined in commission with some the crown; raifed by the crown, officered by the principal peer of the kingdom. See GARTER.

3 N

Clarencieux King at Arms, is fo called from the terward entered upon the law line, and took the de. King. duke of Clarence, to whom he first belonged. His office is to marshal and dispose the funerals of all the inferior nobility, as baronets, knights, efquires, and gentlemen, on the fouth fide of the Trent. See CLA-RENCIEUX.

Norroy King at Arms, is to do the fame on the

north fide of the river Trent.

These two last are also called provincial boralds, in regard they divide the kingdom between them into provinces. By charter, they have power to vifit noblemens families, to fet down their pedigrees, diftinguish their arms, appoint persons their arms, and with garter to direct the other heralds.

Anciently the kings at arms were created and folemnly crowned by the kings of England themfelves; but of later days, the earl marshal has a special commission at every creation to personate the king.

Lyon King at Arms, for Scotland, is the fecond king at arms for Great Britain; he is invefted and crowned with great folemnity. To him belongs the publishing king's proclamations, marshalling funerals, reverling

arms, &c. See Lyon.

King (Dr John), a learned English bishop in the 17th century, bred at Westminster-school, and afterward at Christ church Oxford. He was appointed chaplain to queen Elizabeth. In 1605 he was made dean of Christ-church, and was for feveral years vicechancellor of Oxford. In 1611 he was advanced to the bishopric of London. Besides his Ledures upon Yonab, delivered at York, he published feveral fermons King James I. used to style him the king of preachers; and lord chief juffice Coke often declared, that be was the best speaker in the star-chamber in his time. He was fo constant in preaching after he was a bishop, that, unless he was hindered by want of health, he omitted no Sunday whereon he did not visit some pulpit in London or near it. Soon after his death, the Papifts reported, that he died a member of their church. But the fallity of this flory was fufficiently exposed by his fon Mr Henry King, in a fermon at St Paul's crofs foon after; by bishop Godwin in the Appendix to his Commentarius de prafulibus Anglia, printed in 1622; and by Mr John Gee, in his book, intitled, The foot out of the fnare.

KING (Dr Henry), bishop of Chichester, eldest fon of the former, was born in 1591, and educated at Oxford. He became an eminent preacher, and chaplain to king James I. and Charles I. In 1638 he was made dean of Rochefter; and in 1641 was advanced to the fee of Chichester. Upon the breaking out of the civil wars, and the diffolution of episcopacy, he was treated with great feverity by the friends to the parliament; but recovered his bishopric at the restoration. This worthy prelate, who had a most amiable character, died in 1669; and was interred at his cathedral of Chichester, where a monument was erected to his memory. He published, 1. The plalms of David turned into metre. 2. Poems, elegies, parodoxes, and fonnets. 3. Several fermons, and other works.

King (Dr William), a facetious English writer in the beginning of the 18th century, was well defcended, being allied to the noble families of Clarendon and Rochefter. He was elected a fludent of Christ-church from Westminster-school in 1681, aged 18. He af-

gree of doctor of civil law. He foon acquired a confiderable reputation as a civilian, and was in great practice. He attended the earl of Pembroke, lord lieutenant of Ireland, into that kingdom, where he was anpointed judge advocate, fole commissioner of the prizes, keeper of the records, vicat-general to the lord primate of Ireland ; was countenanced by perfons of the highest rank, and might have made a fortune. But so far was he from heaping up riches, that he returned to England with no other treasure than a few merry poems and humorous effays, and retired to his fludents place at Christ church. He died on Christmas day in 1712, and was interred in the Cloifters of Westminfter abbey. His writings are pretty numerous. The principal are, 1. Animadversions on a pretended account of Denmark, wrote by Mr Molesworth, afterwards lord Molesworth. The writing of these procured Dr King the place of fecretary to princels Aune of Denmark. 2. Dialogues of the dead. 3. The art of love, in imitation of Ovid De arte amandi. 4. A volume of poems. 5. Ufeful transactions. 6. An historical account of the heathen gods and heroes. 7. Several translations -As to the character of Dr King, he haturally hated bufiness, especially that of an advocate: but made an excellent judge when appointed one of the court of delegates. His chief pleafure confifted in trifles; and he was never happier than when he thought he was hid from the world. Yet he loved company, provided they were fuch as tallied with his humour. He would fay a great many ill natured things, but never do one. He was made up of tendernels and pity, and tears would fall from him on the fmallest occasion. His education had been strict, and he was naturally of a religious disposition.

King (Dr Willam), archbishop of Dublin in the 18th-century, was descended from an ancient family in the north of Scotland, but born in the county of Antrim in the north of Ireland. In 1674 he went into priests orders. In 1679 he was promoted by his patron, Dr Parker, archbishop of Dublin, to the chancellorship of St Patrick. In 16 7 Peter Manby, dean of Londonderry, having published at London, in 4to, a pamphlet intitled Confiderations which obliged Peter Manby dean of Londonderry to embrace the Catholic religion, our author immediately wrote an answer. Mr Manby, encouraged by the court, and affifted by the most learned champions of the church of Rome, published a reply under this title, A reformed catechism, in two dialogues concerning the English reformation, &c. in reply to Mr King's answer. &c. Our author foon rejoined in A vindication of the answer. Mr Manby dropped the controverfy; but disperfed a loose sheet of paper, artfully written, with this title, A letter to a friend, showing the vanity of this opinion, that every man's sense and reason are to guide him in matters of faith. This Dr King refuted in A vindication of the Chris stian religion and reformation, against the attempts of a letter, &c. In 1689 he was twice confined in the tower by order of king James II. and the same year commenced doctor of divinity. In 1690, upon king James's retreat to France after the battle at the Boyne, he was advanced to the fee of Derry. In 1692 he published at London in 4to, The flate of the Protestants of Ireland under the late king James's government, &c.

" A history (fays bishop Burnet), as truly as it is finely written." He had by him at his death attefted vouchers of every particular fact alleged in this book, which are now in the hands of his relations. However, it was foon attacked by Mr Charles Leffy. In 1603 our author finding the great number of Proteflant diffenters, in his diocese of Berry, increased by a vast addition of colonies from Scotland, in order to perfuade them to conformity to the established church. published A discourse concerning the inventions of men in the worship of God. Mr Joseph Boyse, a differting minister, wrote an answer. The bishop answered Mr Boyfe, The latter replied. The bishop rejoined. In 1702 he published at Dublin, in 4to, his celebrated treatife De origine mali. Mr Edmund Law, M. A. fellow of Christ's college in Cambridge, afterward published a complete translation of this, with very valuable notes, in 4to. In the fecond edition he has inferted, by way of notes, a large collection of the author's papers on the fame fubject, which he had teceived from his relations after the publication of the former edition. Our author in this excellent treatife has many curious observations. He afferts and proves that there is more moral good in the earth than moral evil. A fermon by our author, preached at Dublin in 1709, was published under the title of Divine predestination and foreknowledge confistent with the freedom of man's will. This was attacked by Anthony Collins, Efq; in a pamphlet intitled, " A vindication of the divine attributes; in some remarks on the archbiflop of Dublin's fermon intitled, Divine predestination, &c." He published likewise, A discourse concerning the confecration of churches; Thowing what is meant by dedicating them, with the grounds of that office. He died ip.1720.

King (Dr William), late principal of St Mary's hall, Oxford, fon of the reverend Peregrine King, was born at Stepney in Middlesex, in the year 1685. He was made doctor of laws in 1715, was secretary to the duke of Ormond, and earl of Arran, as chancellors of the univerfity; and was made principal of St Mary'shall on the death of Dr Hudson in 1719. When he flood candidate for member of parliament for the university, he refigned his office of secretary, but enjoyed his other preferment, and it was all he did enjoy to the time of his death. Dr Clark, who opposed him, earried the election; and after this disappointment, he in the year 1727 went over to Ireland, where he is faid to have written an epic poem, called The Toaft, which was a political fatire, printed and given away to his friends, but never fold. On the dedication of Dr Radcliff's library in 1749, he spoke a Latin oration in the theatre at Oxford, which was received with the highest acclamations; but it was otherwise when printed, he being attacked in feveral pamphlets on account of it. Again; at the memorable contested election in Oxfordshire 1755, his attachment to the old interest drew on him the refertment of the new, and he was libelled in newspapers and pamphlets, against which he defended himself in an Apology, and warmly retaliated on his adverfaries. He wrote feveral other things, and died in 1762. He was a polite fcholar, an excellent orator, an elegant and eafy writer, and effeemed by the first men of his time for his learning

and wit.

KING (Peter), lord high chancellor of Great Britain, was descended of a good family of that name in Somerfetshire, and fon to an eminent grocer and salter in the city of Exeter in Devonshire. He was born at Exeter in 1669, and bred up for fome years to his father's bufiness; but his inclination to learning was for flrong, that he laid out all the money he could fpare in books, and devoted every moment of his leifure hours to fludy: fo that he became an excellent feifolar before the world fuspected any such thing; and gave the public a proof of his skill in church history, in his Inquiry into the constitution, discipline unity, and quor/hip, of the primitive church, that flouri/hed within the first 300 years after Christ, London, 1691, in 8vo. This was written with a view to promote the scheme of a comprehension of the diffenters. He afterwards published the second part of the Inquiry into the conflitation, &c.; and having defired, in his preface, to be shown, either publicly or privately, any mistakes he might have made, that request was first complied with by Mr Edmund Elys; between whom and our author there paffed feveral letters upon the fubject, in \$692, which were published by Mr Elys in 1694, 8vo, under the title of Letters on feveral Subjects. But the most formal and elaborate answer to the Inquiry appeared afterwards, in a work intitled, Original draught of the primitive church.

KIN

His acquaintance with Mr Locke, to whom he was related, and who left him half his library at his death, was of great advantage to him: by his advice, after he had fludied fome time in Holland, he applied himfelf to the fludy of the law; in which profession his learning and diligence made him foon taken notice of. In the two last parliaments during the reign of King William, and in five parliaments during the reign of Queen Anne, he ferved as burgefs for Beer-Alfton in Devonshire. In 1702, he published at London, in Svo, without his name, his Hiflory of the apofle's creed, with critical observations on its several articles; which is highly esteemed. In 1708, he was chosen recorder of the city of London; and in 1710, was one of the members of the house of commons at the trial of Dr Sacheverell. In 1714, he was appointed lord chief justice of the common-pleas; and the April tollowing, was made one of the privy-council. In 1715, he was created a peer, by the title of Lord King, baron of Ockham in Surry, and appointed lord high chancellor of Great Britain; in which post he continued till 1733, when he refigned; and in 1734 died at Ockham in Surry.

King's Bench. See BENCH (King's). King-Bird. See PARADISEA.

King's Fifter. See ALCEDO. Books of KINGS, two canonical books of the Old Testament, fo called, because they contain the history of the kings of Ifrael and Judah from the beginning of the reign of Solomon down to the Babylouish captivity, for the space of near 600 years. The first book of kings contains the latter part of the life of David, and his death; the flourishing state of the Ifraelites under Solomon, his building and dedicating the temple of Jerusalem, his shameful defection from the true religion, and the fudden decay of the Jewish nation af-'ter his death, when it was divided into two kingdoms: the rest of the book is taken up in relating the acts of

King, four kings of Judah and eight of Ifrael. The fe-Kingdoms, cond book, which is a continuation of the fame history, is a relation of the memorable acts of 16 kings of Judah, and 12 of Ifrael, and the end of both kingdoms, by the carrying of the 10 tribes captive into Affyria by Salmanaffar, and the other two into Babylon by Nebuchadnezzar.

> It is probable that these books were composed by Ezra, who extracted them out of the public records, which were kept of what paffed in that nation.

King's-County, a county of the province of Leinfter in Ireland, taking its name from king Philip of Spain, husband to queen Mary. It is bounded on the north by West Meath; on the fonth by Tipperary and Queen's-county, from which it is divided by the Barrow; and part of Tipperary and Galway on the west, from which it is separated by the Shannon. It is a fine fruitful country, containing 257,510 Irish plantation acres, 56 parishes, 11 baronies, and two boroughs, and returns fix members to parliament. It is about 47 miles long and 17 broad, and the chief town is Philipflown.

King's Evil, or Scrophula. See MEDICINE-Index. KING-TE-TCHING, a famous village belonging to the diffrict of Jao-tcheou-fou, a city of China in the province of Kiang-fi. This village, in which are colthe largest cities of China. It is reckoned to contain ed into the midft of a fair, where nothing is heard a- respective names. round but the noise of porters calling out to make way. distance of an hundred leagues. This village, notwithstanding the high price of provisions, is an afylum for a great number of poer families, who could not fubfift any where elfe. Children and invalids find emder the whole extent of this vast bason.

KINGDOM, the territories or extent of country fubject to a king.

KINGDOMS, in natural history. Most naturalists and chemists divide all natural bodies into three great classes, which they call kingdoms. Thefe are the mineral, the negetable, and the animal kingdoms:

This great and first division is founded on this confideration, that any plant or vegetable which is produced, which grows, which is organized, which contains a feed, and which produces its like, feems to be a being

animal differe no less from a simple plant, by fensation, Kingdoms by the use of ita fenses, and by the power of voluntary motion which it possesses, while these qualities do not

belong to any thing which is merely vegetable. But notwithanding these so distinctive marks, philosophers pretend, that this division of natural bodies into classes is only ideal. They affirm, that, by obferving nature attentively, we may perceive, that all her productions are connected together by an uninterrupted chain; and that by furveying the feveral beings, we must be convinced, that any one being differs very little from fome other two between which it feems to be placed; fo that we may descend from the most perfeet animal to the rudest mineral by infensible degrees, and without finding any interval from which a division might be made. The opinions of naturalifts are therefore divided upon this subject; and each opinion seems to be founded upon observations, analogies, and reafonings more or less conclusive.

If we avoid inveftigating extremes, however, the diffinctive marks must be acknowledged fufficiently obvious to justify the triple division above mentioned, and to discriminate the individuals of each.

For a general view of the operations or conduct of nature in those her three kingdoms, see the article NATURE. For a particular confideration of them-(in lected the best workmen in porcelain, is as populous as the animal-kingdom), see Zoology, Animal, Bruts, BIRD, ORNITHOLOGY, INSECT, ENTOMOLOGY, ICHa million of inhabitants, who confume every day more THYOLOGY, FISH, COMPARATIVE Anatomy, and the difthan ten thousand loads of rice. It extends a league ferent animals under their respective names ;- (in the and a half along the banks of a beautiful river, and is vegetable kingdom), BOTANY, PLANT, AGRICULnot a collection of firaggling houses intermixed with TURE, VEGETATION, DEFOLIATION, FRONDESCENTIA. spots of ground; on the contrary, the people com- Gemmatio, FRUIT, LEAF, GERMINATION, &c. and plain that the buildings are too crowded, and that the the different plants under their respective names; long streets which they form are too narrow; those (in the mineral kingdom), MINERALOGY, METALwho pass through them imagine themselves transport- LURGY, and the different flones and metals under their

In what remains of this article we shall consider na-Provisions are dear here, because every thing confuned tural bodies only in a chemical view; that is to fav, is brought from remote places; even wood, fo necef. relatively to the feveral principles which we obtain in fary for their furnaces, is actually transported from the the analysis of those bodies. In the decomposition of all beings truly living, organifed, and containing within themselves a feed by which they may be reproduced, fuch as vegetables and animals, we always obtain an inflammable, fat, or oily fubstance; and on the conployment here, and even the blind gain a livelihood by trary, we do not find the smallest trace of this principle pounding colours. The river in this place forms a in any fubitance purely mineral, not even in fulphur, kind of harbour about a league in circumference; two which is the most inflammable of all these substances. or three rows of barks placed in a line sometimes bor- On the other fide, if we carefully examine and compare with each other the analogous principles obtained from the three kingdoms; fuch as the faline fubstances obtained in the analysis of animals, vegetables, and minerals; we shall eafily perceive, that all the faline matter which comes from the vegetable or animal kingdoms is altered by oil, while all the faline matter which comes from the mineral kingdom is entirely free from oil.

We ought to observe here, that because any matteris found in one or more individuals of any kingdom, we must not therefore conclude, that it belongs to the very diffinct and different from a stone or a metal, in kingdom of such individuals; for we may be convinced, which we at most observe only a regular arrangement from a slight observation of nature, that by a thousand of parts, but not a true organization, and which con- combinations, and particular circumstances, substances tains no feed by which it is capable of reproduction; of quite different claffes or kingdoms are daily found and another foundation of this division is, that an mixed and confounded together. Thus, for example,

within.

Kingdoms within the earth, and even at great depths, that is, in the region appropriated to minerals, fometimes fubstances are found evidently oily, fuch as all bitumens: but we at the same time can prove, and all the observations of natural hiftory prove, that these oily fubflances are only accidentally within the earth, and that they proceed from the vegetable or animal bodies which have been buried in the earth by some of those great revolutions which have happened from time to time upon the furface of our globe. Also in decomposing feveral vegetables and animals, falts are obtained; fuch as common falt, Glauber's falt, and others, which contain nothing oily, and which are confequently matters evidently mineral. But, on the other fide, we are certain that these mineral salts are extraneous to the animals and vegetables in which they are found; that they are only introduced into these living bodies, because they happen to be mixed with the matters which have been applied to them as aliments, and that they ought not to be numbered amongst their principles. The proof of this is, that not only the quantity of these mineral salts is not uniform in animals and vegetables; but also, that not a particle of fuch falts is contained in fome plants and animals equally strong and healthy, and of the same species as those in which these falts have generally been observed.

In the fecond place, we observe, that oils do only exist in the proximate principles of vegetables and animals; that is, in those of their principles which enter immediately into their composition, when those prime ciples have not been altered by further decompositions, and confequently when they still preferve their animal or vegetable character; for by a natural putrefaction continued during a long time, or by chemical operations, not only the materials of which animal and vegetable bodies are formed may be deprived entirely of oil, but also this oil may itself be entirely destroyed or decomposed. These substances in that state contain nothing by which they can be distinguished from minerals. The earths, for example, of vegetables and animals, when they are deprived, by a fufficient calcination of all inflammable matter, have been thought to become entirely fimilar to the calcareous and argillaceous earths found within the globe, and which may be confidered as mineral fubiliances, although probably they have been formerly a part of animal and vegetable

bodies. See Bones. Hence we conclude, that, when we confider natural bodies in a chemical view, we ought to divide them into two great classes. The first class is of substances inanimate, unorganifed, and the principles of which have a degree of fimplicity which is effential to them : these are minerals. The other class contains all those bodies which not only have been distinctly organised, but which also contain an oily matter, which is no where to be found in fubflances which have not made part of animate bodies, and which, by combining with all the other principles of these animate bodies, distinguishes these principles from those of minerals by a less degree of simplicity. This second class contains vegetables and animals. We ought also to remark, that the oil contained in vegetable and animal fubstances, renders them susceptible of fermentation, properly fo called, which cannot by any means take place in any mineral.

We shall now proceed to examine, if, by comparing Kingdoms the principles obtained in the decomposition of vegetables with those obtained in the decomposition of animals, we can find some effential character by which thefe two kingdoms may be chemically diftinguished. in the same manner as we have seen that both of them may be diftinguished from minerals. From experiments we indeed learn, that the principles of vegetables differ evidently enough from those of animals; that in geucral the faline principles of the former are acid, and are transformable in great measure into fixed alkali by incineration, while the principle of the latter are volatile alkalis, or eafily changeable into thele; that vegetables are much farther removed from putrefactionthan animals; laftly, that oils truly animal have a character different from vegetable oils, and are in generali more attenuated, or at least more disposed to be attenuated and volatilifed. But we must at the same time confess, that these differences are not clear and decifive, like those betwixt these two kingdoms and the mineral kingdom; for we do not find any effential principle, either in animals or in vegetables, which is not also to be found in the other. In some plants, chiefly the cruciform, as much volatile alkali, as little fixed alkali, and as much disposition to putrify, are found as in animal-matters; and thence we conclude, that if these two great classes of natural bodies differ chemically from each other, this difference proceeds onlyfrom the quantities or proportions of their feveral principles and properties, and not from any thing diftinct and peculiar; nor is it fimilar to the manner in which both vegetable and animal fubflances differ from minerals, namely, by containing an oil, and possessing a fermentable quality. Befides, the degrees of the chemical differences betwixt thefe three great classes of natural bodies are found to be the fame, in whatever manner we consider them or compare them together. See

KINGHORN, a parliament town in the county of Fife in Scotland, on the Frith of Forth, directly oppofite to Leith. Here is a manufacture of thread flockings knit by the women; the men, being chiefly ma. riners, are employed in coasting ships, in the fishery, or the passage boats from hence to Leith, from which the town of Kinghorn derives confiderable advantage. This place gives a fecond title to the carl of Strathmore.

KINGSBRIDGE; a town of Devonshire, 217 miles from London. It is a pretty place, with a harbour for boats, a free school, a market, and a fair. This is a chapel of eafe to Chefton, and has a bridge over the Salcomb to Dodbrook.

KINGSCLERE, a pleafant town of Hampshire, fituated on the Oxford road from Basingstoke. It is 56 miles from London, and was once the feat of the Saxon kings. It has a market and two fairs.

KINGSFERRY, in Kent, the common way from the main land into the ifle of Shepey; where a cable of about 140 fathom in length, fattened at each end acrofs the water, ferves to get the boat over by hand. For the maintenance of this ferry and keeping up the highway leading to it through the marshes for above one mile in length, and for supporting a wall against the fea, the land-occupiers tax themfelves yearly one penny per acre for fresh marsh-land, and one penny for every.

KIN 470

Brangers or the land-occupiers.

KINGSTON UPON THAMPS, a town of Surry in England, fituated 13 miles from London. It takes its name from having been the refidence of many of our Saxon kings, fome of whom were crowned here on a stage in the market-place. It has a wooden bridge of 20 arches over the Thames, which is navigable here by barges. There is another bridge here of brick, over a stream that comes from a spring in a cellar four miles above the town, and forms fuch a brook as to drive two mills not above a bow-shot from it and from each other. It is generally the place for the fummeraffizes of this county, there being a gallows on the top of the hill that overlooks it. It is a populous, trading, well-built town, and in the reigns of King Edward II. and III. fent members to parliament. It has a free-school; an alms-house built in 1670 for six men and fix women, and endowed with lands to the value of 801. a year; and a charity school for 30 boys, who are all clothed. Here is a spacious church with eight bells, adjoining to which, on the north fide, was formerly a chapel dedicated to St Mary, in which were the pictures of three of the Saxon kings that were crowned here, and also that of King John, who gave the inhabitants of this town their first charter of incorporation. But these were all destroyed by the fall of this chapel in 1730. Here is a good market for corn, &c. and three fairs.

KINGSTON upon Hull, a town in the east riding of Yorkshire, 173 miles from London. Its common name is simply Hull. It is situated at the conslux of the rivers Hull and Humber, and near the place where the latter opens into the German Ocean. It lies fo low, that by cutting the banks of the Humber the country may be laid under water for five miles round. Towards the land it is defended by a wall and a ditch, with the farther fortification of a castle, a citadel, and a block house. A dock was begun here, but after great expence left unfinished.—A new cut has been lately made to Hull by Weighton. The town is large and populous, containing two churches, feveral meeting houses, a free-school, a charity school, and some hospitals. Among the latter is one called Trinity. house, in which are maintained many diffressed seamen, both of Hull and other places, that are members of its port. It is governed by 12 elder brethren and fix affiliants; out of the former are chosen annually two wardens, and out of the younger brethren two flewards; they determine questions between masters and feamen, and other fea matters. A handfome infirmary has lately been crected without the town to the north. Here are also an exchange and a custom-house, and over the Hull a stone bridge confisting of 14 arches. A good harbour was made here by Richard II. This town has not only the most considerable inland trassic strade superior to any in the kingdom, excepting the cloth. It has a charity-school, a market, and three

the ferry keeper, who is obliged to tow all travellers By means of the many large rivers that fall into the over free, except on these four days, viz. Palm Mon-Humber, it trades to almost every part of Yorkshire, day, Whit-Monday, St James's day, and Michaelmas- as well as to Lincolnshire, Nottinghamshire, Staffordday, when a horseman pays two-pence and a footman shire, Derbyshire, and Cheshire; the commodities of one penny. But on Sunday, or after eight o'clock at which counties are brought hither, and exported to Holland, Hamburgh, France, Spain, the Baltic, and horseman, and two-pence of every footman, whether other parts of Europe. In return for those, are imported iron, copper, hemp, flax, canvas, Russia linea and yarn, befides wine, oil, fruit, and other articles. Such quantities of corn are also brought hither by the navigable rivers, that Hull exports more of this commodity than London. The trade of Hull with London, particularly for corn, lead, and butter, and with Holland and France, in times of peace, for those commodities, as well as for cloth, kerfeys, and other manufactures of Yorkshire, is so considerable as to employ not only fingle veffels, but fleets; the Hull fleets to London being generally from 50 to 60 fail, and in time of war frequently 100 fail or upwards. The mayor of Hull has two fwords, one given by King Richard II. the other by Henry VIII. but only one is borne before him at a time; also a cap of maintenance, and an oar of lignum vitæ as a badge of his admiralty jurifdiction within the limits of the Fiumber. This town gave title of earl to Robert Pierpoint of Holme Pierpoint, vifcount Newark, created in the 4th of Charles I. Being unfortunately flain in croffing the Humber in 1643, he was succeeded by his fon Henry, created marquis of Dorchester in 1645, only for life; who dying in 1680, without male iffue, was fucceeded in the earldom by Robert, grandfon of his younger brother William Pierpoint of Thorefby; who dying unmarried in 1682, left this honour to William his brother and heir; and he also dying without iffue in 1600, it descended to his brother Evelyn, who was further advanced to the honours of marquis of Dorchefter in 1706 and duke of Kingston in 1715; and dying in 1725 was fucceeded by his grandfon Evelyn last duke of Kington, who died in 1773, and the title became extinct.

KINGSTON, a town of Ireland, in the province of Leinster and capital of King's county. W. Long. 7. 20. N. Lat. 53. 15. It is otherwise called Philips-

KINGSTON, a town of Jamaica, feated on the north fide of the bay of Port-Royal. It was founded in the year 1693, when the repeated defolations by earthquake and fire had driven the inhabitants from Port-Royal. It extends a mile from north to fouth, and about as much from east to west, on the harbour. It contains about 3000 houses, besides negro-houses and warehouses. The number of white inhabitants is about 8000; of free people, of colour, 1500; and of flaves, about 14,000. It is the county-town, where the affizes are held, in January, April, July, and October, and last about a fortnight. It is a place of good trade; and is much reforted to by merchants and feamen, because most of the ships come to load and unload their cargoes here. W. Long. 76. 32. N. Lat. 17. 40.

KINGION, or KYNETON, a pretty large town in Herefordshire, 146 miles from London. It is situated on the river Arrow, and is inhabited chiefly by of any port in the north of England, but a foreign clothiers, who drive a confiderable trade in narrow

Rinner fairs. The markets on Wednesday before Easter, the utmost fafety. Within the haven on the west fide Kintora

KINNOR, or CHINNOR. See CHINNOR.

KINO, in the materia medica, a gum refin. This drug was first recommended to the attention of medical practitioners by Dr Fothergill, as being a very ufeful vegetable altringent; and in the hands of other practitioners it has been fo far found to answer the character he gave of it, that it is now in very common ufe. It has a confiderable refemblance to the catechu; but is much more of a refinous nature, and of a lefs firm texture: it is also redder and more astringent; its watery folution more decomposable by acids; and its ink less permanent. Its colouring and aftringent matter are more perfectly taken up by fpirit than by water, though water readily enough extracts a confirlerable share of both. It is used as an astringent in diarrhœa, hæmorrhagies, &c. In proof-spirit it forms an elegant tincture : and it is a principal ingredient in the pulvis flypticus, and some other officinal composi-

KINROSS, the county-town of Kinrosshire in Scotland, firuated in W. Long. 3. 7. N. Lat. 56. 15. on the well fide of Lochleven, a fresh-water lake about 10 miles in compass, abounding with pike, trout, perch. and water fowl. The manufactures are linen and fome cutlery ware. The house of Kinross, an elegant ancient structure, stands on the north fide of the town. Kinrofs fends a member to parliament by turns with Clackmannan. In the lake are two islands; on one of which appear the ruins of a priory, heretofore poffeffed by the Culdees; the other is famous for the castle in which Queen Mary was imprisoned by her re-

bellions fubiects.

KINSALE, a town of the county of Cork in Irehand, fituated at the mouth of the river Ban or Bandon, 136 miles from Dublin. It is reckoned the third town in the kingdom, and inferior only to Cork in point of trade. It is neat, well built, and wealthy; is governed by a fovereign and recorder, and returnstwo members to parliament, patronage in the Southwell family. It is defended by a ftrong fort built by king Charles II. called Charles's Fort; and on the opposite shore there are two well built villages, called Cove and Scilly. In the town and liberties are 6 parifhes, 30 plough lands, and therein 6846 acres. The barracks hold 12 companies of foot, belides a regiment at Charles's fort. In the centre of the town is a good market house, and near it a ftrong built prison; and there are scattered up and down the ruins of several monasteries and religious houses. It has two fairs. In time of war Kinfale is a place of much bufinefs, being then frewar, for which reason most of the houses are then let at double rents. The harbour is very commodious, and perfectly fecure; fo large that the English and Dutch Smyrna fleets have anchored in it at the fame

Whitfuntide, and Christmas, are so considerable for lies a great shelf, which shoots a great way off from Kircher. corn cattle, leather, home made linen and woollen cloth, the land; but leaves an ample passage by the side of it, and all forts of provisions, that they are more like in which, as in all the rest of the harbour, it is many fathoms deep. Lord Kinfale has the ancient privilege of keeping his hat on in the king's presence. Kinsale gives the title of baron to the very ancient family of Courcy, lineally descended from John de Courcy earl of Ulfter, who from him have the privilege to be covered in the presence of the king of England,

KINTORE, a royal borough of Aberdeenshire in Scotland, fituated on the river Don, in W. Long. 2. 5. N. Lat. 57. 38. It gives the title of earl to a branch of the noble family of Keith, but in other respects is

inconfiderable.

KINTYRE. See CANTIRE.

KIOF, or Kiow, a confiderable town of Polanda and capital of the Ukrain in the palatinate of the fame name, with an archbishop's see and a castle. It belongs to Ruffia, and carries on a confiderable trade. It is divided into the Old and New Town, and feated on the river Nieper, in E. Long, 31, 51, N. Lat 50.

KIPPING (Henry), in Latin Kippingius, a learned German Lutheran born at Boftock; where, after having received the degree of mafter of arts, he was met by fome foldiers who pressed him into the service. This, however, did not prevent his following his fludies. One day while he was upon duty, holding his musket in one hand and the poet Statius in the other, a Swedish counsellor, who perceived him in that attitude, came up to him, entered into discourse with him. and then taking him to his bouse made him his librarianand procured him the under-rectorship of the college of Bremen, where he died in 1678. He wrote many works in Latin; the principal of which are, 1. A. treatife on the antiquities of the Romans. 2. Another on the works of Creation. 3. Several differtations on the Old and New Testament, &c.

KIRCH (Christian Frederic), of Berlin, a celebrated aftronomer, was born at Guben in 1694, and acquired great reputation in the observatories of Dantzic and Berlin. Godfrey Kirch his father, and Mary his mother, acquired confiderable reputation by their astronomical observations. This family corresponded with all the learned focieties of Europe, and their

aftronomical works are in high repute.

KIRCHER (Athanafius), a famous philosopher and mathematician, was born at Fulde in 1601. In 1618 he entered into the fociety of the Jefuits, and taught philosophy, mathematics, the Hebrew and Syriac languages, in the university of Wirtsburg, with great applaufe till the year 1631. He went to France on account of the ravages committed by the Swedos in Franconia, and lived fome time at Avignon. He quented by rich homeward bound fleets and ships of was afterwards called to Rome, where he taught mathematics in the Roman college, collected a tich cabinet of machines and antiquities, and died in 1680.-The quantity of his works is immenfe, amounting to 22 vols in folio, 11 in quarto. and 3 in 8vo; enough time. There is a dock and yard for repairing thips of to employ a man for a great part of his life even to war, and a crane and gun wharf for landing and thip transcribe them. Most of them are rather curious than ping heavy artillery. Ships may fail into or out of this useful; many of them visionary and fanciful; and if harbour, keeping in the middle of the channel, with they are not always accompanied with the greatest ex-

actness -

Rirchman achnels and precition, the reader, it is prefumed, will Kirkby. not be altonished. The principal of his works are, 1. Prelufiones magnetica. 2. Primitia gnomonica catoptrica. 3. Ars magna lucis & umbra. 4. Musurgia universalis. 5. Obelifcus Pamphilius. 6. Oedipus Ægyptiacus, four volumes, folio. 7. Itinerarium extaticum. 8. Obelifcus Ægyptianus, in four volumes, folio. 9. Mundus subterraneus. 10. China illustrata.

KIRCHMAN (John), an eminent German divine, was born at Lubec in 1575. He studied in several places of Germany; in 1602 was made professor of poetry at Roftock, and in 1613 rector of the university at Lubec. He exercised this last employment with an extraordinary application during the rest of his life, and died in 1643. He wrote feveral works; the most esteemed of which are, 1. De funeribus Romanorum. 2. De annulis liber fingularis.

KIRIATHAIM, (anc. geog.), one of the towns built by the Reubenites; reckoned to the tribe of Reuben (Joshua, xiii.), 12 miles to the west of Midaba. The ancient refidence of the giants called Emin.

KIRIATH ARBA. See HEBRON.

KIRIATH - Baal, or Cariath - baal, called also Kiriath-jearim, "the city of the woods;" one of the cities of the Gibeonites belonging to the tribe of Judah, nine miles from Aelia, in the road to Diospolis, It was also called Baala (Joshua). The ark of the covenant, after its recovery from the Philiftines, flood for fome time in this city (1 Sam. vii).

KIRK, a Saxon term, fignifying the fame with

church.

KIRK-Sellions, the name of a petty ecclefiaftical judicatory in Scotland. Each parish, according to its extent, is divided into feveral particular diffricts; every one of which has its own elder and deacon to overfee it. A confistory of the ministers, elders, and deacons of a parish, form a kirk-fession .- These meet once a week, the minister being their moderator, but without a negative voice. It regulates matters relating to public worship, elections, catechifing, visitations, &c. It judges in matters of less scandal; but greater, as adultery, are left to the prefbytery; and in all cases an appeal lies from it to the presbytery. Kirk-fessions have likewise the care of the poor and poor's funds.

KIRKALDY, a town of the county of Fife in Scotland, two miles to the north-east of Kinghorn. It is a royal borough, the feat of a presbytery, and gives the title of baron to the earl of Melvill. The town is populous, well built, and extends a mile in length from east to west, enjoying a tolerable share of trade by exporting its own produce and manufactures of corn, coal, linen, and falt. W. Long. 3. o. N.

Lat. 56. 8.

KIRKBY LONSDALE, a town of Westmoreland, 253 miles from London. It is a large place, with a woollen manufactory, and a market on Tuefday. It has a free school well endowed, with three presentations to Christ's college Cambridge. It has a large church, and a good stone bridge of three arches over the Lon. From its churchyard and the banks of the river, there is a very fine profpect of the mountains at a vast distance, as well as of the course of the river, which abounds with falmon, trout, &c. and prowisions of all forts are very cheap here.

Nº 172.

KIRKBY - Steven, or Stephen's - Church, a town of Kirkly Westmoreland, 257 miles from London, stands on the river Eden near Sedbergh and Afgarth. The church is a large building with a lofty tower; in it are feveral old monuments. Here is a good free school that has two exhibitions. The town is noted for the manufactory of yarn-stockings; and it has a market and

KIRRBY-Thore, a town of Westmoreland, stands alfo on the river Eden, north-west of Appleby, 267 miles from London. A horn of a moofe-deer was found here a few years fince, at the depth of four feet from the furface of the earth; and feveral other antiquities have been dug up or taken out of a well, discovered at the end of the town near the bridge. Below it are the vast ruins of an ancient town, where Roman coins and urns are frequently dug up. The people call it Whely castle, 300 yards in length, and 150 in breadth, with three entrances on each fide, with bulwarks before them. At a little distance from thence Roman urns are found containing bones and affices, The old military-way runs through it, called the Maiden way, because it began at Maiden-castle in

Stainmore in Yorkshire, north riding,

KIRKCUDBRIGHT, beginning at the middle of Dumfries-shire in Scotland, makes a considerable part of Galloway, of which the earls of Nithifdale were hereditary flewards. The face of the country exhibits the appearance of one continued heath, producing nothing but pasture for sheep and small black cattle, which are generally fold in England: yet thefe dusky moors are interfected with pleasant valleys, and adorned with a great number of castles belonging to private gentlemen, every house being furrounded with an agreeable plantation. It is watered by the river Dee; which, taking its rife from the mountains near Carrick, runs through a tract of land about 70 miles in length, and, entering the Irish sea, forms the harbour of Kirkcudbright, a fmall inconfiderable borough, admirably fituated for the fishery and other branches of commerce, which are almost totally neglected through the poverty and indolence of the inhabitants. There is no other town of any confequence in this stewartry. Kirkcudbright gives title of baron to the Maclellans, who formerly were a powerful family in the county.

KIRKHAM, a town of Lancashire, 221 miles from London, stands near the Ribble, fix miles from the Irish sea, in that part of the county called the Field-lands. It has a market and three fairs, and a free school well endowed. By the late inland navigation, it has a communication with the rivers Merfey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham York, Westmoreland, Chef-

ter, Warwick, Leicester, Oxford, Worcester, &c. KIRKOSWALD, a town of Cumberland on the Eden, 201 miles from London It had formerly a castle, which was demolished above 100 years ago. It has a market and two fairs. Its church is a very irregular old building; and the belfrey is placed distant from the church on the top of an hill, that the found of the bells might be more easily heard by the circumjacent villages.

KIRK-

Kirkwall, KIRKWALL, the capital of the Orkneys, fitua- ex MSS. editus, et ad verbum in Latinum translatus, in Kirtle Kirstenius, ted in the island of Pomona, in W. Long. o. 25. N. Lat. folio. 2. De vero usu et abusu Medicina. 3. Gran-\$8. 33. It is built upon an inlet of the fea near the middle of the island, having a very safe road and harbour for shipping. It is a royal borough, governed by a provoit, four bailiffs, and a common-council. It was formerly possessed by the Norwegians, who beflowed upon it the name of Crucoviaca. From king Tam es III. of Scotland they obtained a new charter empowering them to elect their own magistrates year, ly, to hold borough-courts, arreft, imprison, make laws and ordinances for the right government of the town; to have a weekly market, and three fairs annually at certain fixed terms; he moreover granted to them fome lands adjoining to the town, with the customs and shore-dues, the power of a pit and gallows, and exempted them from the expence of fending commissioners to parliament. This charter has been confirmed by fucceeding monarchs. At prefent Kirkwall is the feat of justice, where the steward, sheriff, and commissary, hold their several courts of jurisdiction: Here is likewise a public grammar-school, endowed with a competent falary for the mafter. The town confifts of one narrow freet about a mile in length; the houses are chiefly covered with flate, though not at all remarkable for neatness and convenience. — The principal edifices are the cathedral church and the bishop's palace. The former, called St Magnus, from Magnus king of Norway, the fupposed founder of the town, is a large Gothic ftructure: the roof is supported by 14 pillars on each fide, and the fpire is built upon four large columns, The gates are decorated with a kind of Mosaic work. of red and white stones elegantly carved and flowered. By the ruins of the king's castle or citadel, it appears to have been a strong and stately fortress. At the north end of the town there is a fort of fortification built by the English in the time of Oliver Cromwell. It is furrounded with a ditch and rampart, and fill mounted with fome cannon for the defence of the harbour.

KIRSTENIUS (Peter), professor of physic at Upfal, and phylician-extraordinary to the queen of Sweden, was born at Breslaw in 1577. He studied Greek, Latin, Hebrew, Syriac, natural philosophy, anatomy, botany, and other fciences. Being told that a man could not diftinguish himself in physic unless he understood Avicenna, he applied himself to the study of Arabic; and not only to read Avicenna, but alfo Mefue, Rhafis, Abenzoar, Abukafis, and Averroes. He visited Spain, Italy, England, and did not return home from his travels till after feven years. He was chosen by the magistrates of Breslaw to have the direction of their college and of their schools. A fit of fickness having obliged him to refign that difficult employment, with which he was also much difgusted, he applied himself chiefly to the practice of physic, and went with his family into Prussia. Here he obtained the friendship and esteem of the chancellor Oxenstiern, whom he accompanied into Sweden; where he was made professor of physic in the univerfity of Upfal, and physician to the queen. He died in 1640. It is faid in his epitaph, that he understood 26 languages. He wrote many works; among which are, I. Liber secundus Canonis Avicenna, typis Arabicis, Vol. IX. Part II.

matica Arabica, folio. 4. Vita quatuor Evangelina rum, ex antiquissimo codice MSS. Arabico eruta, in folio.

v. Note in Evangelium S. Matthei, ex collatione textuum Arabicorum, Syriacorum, Ægyptiacorum, Gracorum, &

Latinorum, in folio, &c.

He ought not to be confounded with George Kerflenius, another learned physician and naturalist, who was born at Stettin, and died in 1660; and also wrote feveral works which are efteemed.

KIRTLE, a term used for a short jacket; also for

a quantity of flax about a hundred weight.

KIRTON, or KIRKTON, a town of Lincolnshire. 151 miles from London. It had its name from its kirk or church, which is truly magnificent. It has a market and two fairs. This place is famous for the pippin, which, when grafted on its flock, is called the rennet. It gives names to its hundreds, in which are four villages of the fame name.

KISSER, the ancient Colonia Affuras in Africa, as appears from many infcriptions still to be met with in the place. Here is a triumphal arch done in a very good tafte: there is also a small temple of a square figure, having feveral inftruments of facrifice carved upon it; but the execution is much inferior to the defign, which is very curious. The town is fituated in the kingdom of Tunis, on the declivity of a hill. above a large fertile plain; which is ftill called the plain of Surfo, probably from its ancient name Af-

KISSING, by way of falutation, or as a token of respect, has been practised in all nations. The Roman emperors faluted their principal officers by a kifs. Kiffing the mouth or the eyes was the usual compliment upon any promotion or happy event. Soldiets kiffed the general's hand when he quitted his office. Fathers, amongst the Romans, had so much delicacy. that they never embraced their wives in the prefence of their daughters. Near relations were allowed to kiss their female kindred on the mouth: but this was done in order to know whether they fmelt of wine or not; because the Roman ladies, in spite of a prohibition to the contrary, were found sometimes to have made too free with the juice of the grape. Slaves kiffed their mafters hand, who used to hold it out to them for that purpose. Kiffing was a customary mode of falutation amongst the Jews, as we may collect from the circumstance of Judas approaching his Master with a kifs. Relations need to kifs their kindred when dying, and when dead; when dying, out of a france opinion that they fhould imbibe the departing foul; and when dead, by way of valedictory ceremony. They even kiffed the corple after it was conveyed to the pile, when it had been seven or eight days dead.

KIST1, an Afiatic nation, which extends from the highest ridge of Caucasus, along the Sundsha rivulets. According to Major Rennel*, they are bounded to . Memoir According to Major Reinict , they are bounded to the west by the little Cabarda, to the east by the Tar. of a map of the countries tars and Lesguis, and to the south by the Lesguis comprehended and Georgians. He imagines they may be the people between the whom Gaerber calls the Taulinzi, i.e. "mountaineers," Black Sea and to whom he attributes the following ftrange cu- and the Cafftom :- "When a guest or stranger comes to lodge pian. with them, one of the hoft's daughters is obliged to 30

receive him, to unfaddle and feed his horfe, take care by them to the whole Kifti nation. The chief village of his baggage, prepare his dinner, pass the night with him, and continue at his disposal during his stay. At his departure, the faddles his horfe and packs up his baggage. It would be very uncourtly to refuse any of these marks of hospitality." The different tribes of this reftlefs and turbulent nation are generally at variance with each other, and with all their neighbours. Their dialects have no analogy with any known language, and their hiftory and origin are at prefent ut-

terly unknown. Their districts, as enumerated in Major Rennel's Memoir, are, 1. Ingushi, about 60 miles to the southward of Mofdok, in the high mountains about the Kumbelei. 2. Endery; and, 3. Axai, on a low ridge between the Sundsha and Iaxai rivers. In their territories are the hotwells. 4. Ackinyurt, towards the upper part of the Sundsha and Kumbelei. 5. Ardakli, on the Roshni that joins the Sundsha. 6. Wapi, near the Offetin village Thim, towards the fource of the Terek. 7. Angusht, on the upper part of the Kumbelei. 8. Shalkha, called by the Ruffians Maloi Angust. 9. Tshetshen, on the lower part of the Argun river. 10. Atakhi, a small district on the upper part of the Argun. 11. Kulga, or Dihanti, in the high mountains. 12. Galgai, or Halha, about the fource of the Asai, a Sundsha rivulet. 13. Tshabrilo, and Shabul, on the Sundsha. 14. Tshishni-Kabul, on the Roshni, a Sundsha rivulet. 15. Karaboulak, a wandering tribe, who have their little villages about the fix uppermost rivulets of the Sunsha, particularly the Fortan. 16. Meesti, Meredshi, Galashka, and Duban. are fmall tribes on the Axai.

The Ingushi, or first of the above tribes, submitted to Ruffia in 1770. They are capable of arming about 5000 men; they call themselves Ingushi, Kisli, or Halha; they live in villages near each other, containing about 20 or 30 houses; are diligent husbandmen, and rich in cattle. Many of their villages have a stone tower, which ferves in time of war as a retreat to their women and children, and as a magazine for their effects. Thefe people are all armed, and have the custom of wearing shields .- Their religion is very simple, but has some traces of Christianity: They believe in one God, whom they call Dailé, but have no faints or religious perfons; they celebrate Sunday, not by any religious ceremony, but by resting from labour; they have a fast in spring, and another in summer; they observe no ceremonies either at births or deaths; they allow of polygamy, and eat pork. One kind of facrifice is usual among them: at certain times a sheep is killed by a person who seems to be considered as a kind of prieft, as he is obliged to live in a state of celibacy. His habitation is in the mountains, near an old stone church, which is faid to be adorned with various statues and inscriptions. Under the church is a vault that contains certain old books, which, however, no one ever attempts to approach. Mr Guldenstaedt + was prevented by the weather from vifiting this church.

The 6th, 7th, and 8th tribes, which were formerly tributary to the Cabardean princes, submitted to Rusfia in 1770. The 9th, Tthetshen, is governed by its own chiefs, who are related to the Avar-Khan. This tribe is fo numerous and warlike, and has given the Ruffians fo much trouble, that its name is usually given

of Tshetshen lies on the Argun, about 15 miles from its mouth. Its other principal villages are Hadshiaul and langejent, both on the Sundsha.

KIT, in music, the name of a small violin of such form and dimension as to be capable of being carried in a case or sheath in the pocket. Its length, meafuring from the extremities, is about 16 inches, and that of the bow about 17. Small as this inftrument is, its powers are coextensive with those of the violin.

Kig-Kat Club, an affociation of above 30 noblemen and gentlemen of diftinguished merit, formed in 1703, purely to unite their zeal in favour of the Protestant fuccession in the house of Hanover. Their name was derived from Christopher Kat, a pastry-cook, near the tavern where they met in King's-ffreet, Westminster, who often fupplied them with tarts. Old Jacob Tonfon was their bookfeller; and that family is in possesfion of a picture of the original members of this famous club, painted by Sir Godfrey Kneller. The defign of these gentlemen was to recommend and encourage true loyalty by the powerful influence of wit and humour; and Sir Samuel Garth diftinguished himself by the extempore epigrams he made on their toafts, which were inscribed on their drinking glasses.

KITCHEN, the room in a house where the provisions are cooked.

Army KITCHEN, is a space of about 16 or 18 feet diameter, with a ditch-furrounding it three feet wide; the opposite bank of which ferves as a feat for the men who drefs the victuals, The kitchens of the flank companies are contiguous to the outline of the camp; and the intermediate space is generally diffributed equally for the remaining kitchens; and as each tent forms a mess, each kitchen must have as many fire places as there are tents in the company.

KITCHEN Garden, a piece of ground laid out for the cultivation of fruit, herbs, pulfe, and other vegetables, used in the kitchen.

A kitchen-garden ought to be fituated on one fide of the house, near the stables, from whence the dung may be easily conveyed into it; and after having built the wall, borders should be made under them; which, according to Miller, ought to be eight or ten feet broad; upon those borders exposed to the fouth, many forts of early plants may be fown; and upon those exposed to the north, you may have fome late crops, taking care not to plant any fort of deep-rooting plants, especially beans and peafe, too near the fruittrees. You should next proceed to divide the ground into quarters; the best figures for these is a fquare or an oblong, if the ground will admit of it; otherwif they may be of that shape which will be most advan tageous to the ground : the fize of these quarters should be proportioned to that of the garden; if they are too fmall, your ground will be loft in walks, and the quarters being inclosed by espaliers of fruit-trees, the plants will draw up flender, for want of a more open exposure. The walks should also be proportioned to the fize of the ground: thefe in a fmall garden should be fix feet broad, but in a large one ten; and on each fide of the walk there should be allowed a border three or four feet wide between it and the efpalier; and in these borders may be fown some small falads, or any other herbs that do not take deep root

KNARESBOROUGH, a town in the West Riequally admired by all the inhabitants of that city. ding of Yorkshire in England, 199 miles from London, In 1758, Prince Henry coming to Leipfic, Mr Kleift is an ancient borough by prescription, called by fodefired to ferve in his army with the regiment of Hau- reigners the Yorkshire Sparw. It is almost encompassed fen, which was readily granted. Opportunities of by the river Nid, which issues from the bottom of distinguishing himself could not be wanting under that Craven hills; and had a priory, with a castle, long great officer, and he always communicated his cou- fince demolished, on a craggy rock, whence it took the rage to the battalion under his command. He also name. The town is about three furlongs in length;

Knapdale and the parish is famous for four medicinal springs near each other, and yet of different qualities. 1. The

fweet fpaw, or vitriolic well, in Knaresborough forest, three miles from the town, which was discovered in 1620. 2. The stinking, or fulphureous spaw, which is used only in bathing. 3. St Mungo's, a cold bath, four miles from the town. 4. The dropping-well, which is in the town, and the most noted petrifying spring in England, fo called by reason of its dropping from the spongy rock hanging over it. The ground which receives it, before it joins the well, is, for 12 yards long, become a folid rock. From the well it runs into the Nid, where the spring water has made a rock that stretches some yards into the river. The adjacent fields are noted for liquorice, and a foft yellow marle, which is rich manure. The town is governed by a bailiff. Its baths are not fo much frequented fince Scarborough Spaw came in vogue. It has a good market and fix fairs. Here is a stone bridge over the river, near one end of which is a cell dug out of the rock, and called St Robert's chapel.

KNAPDALE, one of the divisions of Argyleshire in Scotland. It is parted from Cowal on the east by Lochfyn, borders with Kintyre on the fouth, with Lorn on the north, by Braidalbin on the north-east, and on the west by the Hebrides. Its length from north to fouth does not exceed 20 miles, and the breadth in fome places may amount to 13. It is joined to Kintyre by a neck of land not above a mile broad, over which the country people draw their boats, to avoid failing round Kintyre. This part of Knapdale abounds with lakes, fome of them containing little islands, on which there are castles belonging to different proprietors. The grounds are more adapted for pasturage than grain; but that on the fide of Lochow

is fruitful in both.

KNAPSACK, in a military fense, a rough leather bag which a foldier carries on his back, and which contains all his necessaries. Square knapsacks are most convenient; and should be made with a division to hold the shoes, black ball and brushes, separate from the linen. White goat-skins are the best.

KNAVE, an old Saxon word, which had at first a fense of simplicity and innocence, for it signified a boy : Sax. enapa, whence a knave-child, i. e. a boy, diffinguished from a girl, in several old writers; afterwards it was taken for a fervant-boy, and at length for any fervant-man. Also it was applied to a minister or officer that bore the shield or weapon of his superior; as field-knapa, whom the Latins call armiger, and the French escuyer, 14 Edw. III. c. 3. And it was fometimes of old made use of as a titular addition; as Foannes C. filius Willielmi C. de Derby, knave, &c. 22 Hen. VII. c. 37. The word is now perverted to the hardest meaning, viz. a falle deceitful fellow.

KNAVESHIP, in Scots law, one of the names of the small duties payable in thirlage to the miller's fer-

wants, called fequels.

KNAUTIA, in botany: A genus of the monogymia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 48th order, Aggregata. The common calyx is oblong, fimple, quinqueflorous; the proper one fimple, fuperior; the florets irregular; the receptacle naked.

KNEE, in anatomy, the articulation of the thigh

and leg bones. See Anatomy, no 59.

KNEE, in a ship, a crooked piece of timber, having Knee. two branches or arms, and generally used to connect the beams of a ship with her sides or timbers.

The branches of the knees form an angle of greater or fmaller extent, according to the mutual fituation of the pieces which they are defigned to unite. One branch is fecurely bolted to one of the deck-beams. whilft the other is in the fame manner attached to a corresponding timber in the ship's side, as represented by E in the plate of MIDSHIP Frame.

Befides the great utility of knees in connecting the beams and timbers into one compact frame, they contribute greatly to the firength and folidity of the ship, in the different parts of her frame to which they are bolted; and thereby enable her with greater firmness

to refilt the effects of a turbulent fea.

In fixing of these pieces, it is occasionally necessary to give an oblique direction to the vertical or fide branch, in order to avoid the range of an adjacent gunport, or because the knee may be so shaped as to require this disposition; it being sometimes difficult to procure fo great a variety of knees as may be necessary in the construction of a number of ships of war.

In France, the fearcity of these pieces has obliged their ship-wrights frequently to form their knees of

Knees are either faid to be lodging or hanging. The former are fixed horizontally in the ship's frame, having one arm bolted to the beam, and the other across two or three timbers, as reprefented in the DECK, Plate CLVI. The latter are fixed vertically, as we have described above. See also SHIP-Building, DECK, and MIDSHIP-Frame.

KNEE of the Head, a large flat piece of timber, fixed edgeways upon the fore-part of a ship's stem, and supporting the ornamental figure or image placed under

the bowsprit. See SHIP-Building.

The knee of the head, which may properly be defined a continuation of the stem, as being prolonged from the stem forwards, is extremely broad at the upper-part, and accordingly composed of several pieces united into one, YY (Pieces of the Hull, in SHIP-Building Plates). It is let into the head, and fecured to the ship's bows by strong knees fixed horizontally upon both, and called the cheeks of the head. The heel of it is scarfed to the upper-end of the fore foot; and it is fastened to the stem above by a knee, called a standard, expressed by & in the plate.

Befides fuporting the figure of the head, this piece is otherwife ufeful, as ferving to fecure the boom or bumkin, by which the fore-tack is extended to windward; and by its great breadth, preventing the ship from falling to leeward when close-hauled so much as fhe would otherwife do. It also affords a greater fecurity to the bowfprit, by increasing the angle of the bob-stay, fo as to make it act more perpendicularly on

the bowfprit.

The knee of the bead is a phrase peculiar to shipwrights; as this piece is always called the cut-water by feamen, if we except a few, who, affecting to be wifer than their brethren, have adopted this expression probably on the prefumption that the other is a cantphrase or vulgarism.

Carling KNERS, in a ship, those timbers which extend from the ship to the hatch-way, and bear up the

deck on both fides.

Knight

is well effablished in these kingdoms. He was born of too much importance to be left to chance or their at Lubeck in 1648; and received his first instructions own choice. A form was invented by which they were in the school of Rembrant, but became afterwards a disciple of Ferdinand Bol. When he had gained as much knowledge as that school afforded him, he travelled to Rome, where he fixed his particular attention on Titian and the Caraccii. He afterwards vifited Vepice, and diftinguished himself so effectually in that city by his historical pictures and portraits of the noble families there, that his reputation became confiderable in Italy. By the advice of fome friends he came at last to England, where it was his good fortune to gain the favour of the duke of Monmouth : by his recommendation, he drew the picture of King Charles II. more than once; who was fo taken with his skill in doing it, that he used to come and fit to him at his house in Covent-garden piazza. The Death of Sir Peter Lely left him without a competitor in England, and from that time his fortune and fame were thoroughly established. No painter could have more inceffant employment, and no painter could be more diftinguished by public honour. He was flate-painter to Charles II. James II. William III. Queen Anne, and George I. equally efteemed and respected by them all: the Emperor Leopold made him a knight of the Roman empire, and King George I. created him a baronct. Most of the nobility and gentry had their likeneffes taken by him, and no painter excelled him in a fure outline, or in the graceful disposition of his figures : his works were celebrated by the best poets in his time. He built himself an elegant house at Whitton near Hampton-court, where he spent the latter part of his hfe; and died in 1726.

KNIFE is a well-known instrument, made for cutting, and adapted in form to the uses for which it is

defigned.

Knives are faid to have been first made in England in 1563, by one Matthews, on Fleet bridge, London. The importation of all forts of knives is prohibited.

KNIGHT (eques), among the Romans, a person of the fecond degree of nobility, following immediately that of the fenators. See Equestrian Order,

and Equites.

KNIGHT, or Cnecht (Germ.), in feodal history, was originally an appellation or title given by the ancient Germans to their youth after being admitted to the

privileges of bearing arms.

The passion for arms among the Germanic states, . View of as described by Dr Stuart *, was carried to extremity. It was amidft scenes of death and peril that the young were educated: It was by valour and feats of prowels that the ambitious fignalized their manhood. All the honours they knew were allotted to the brave. The fword opened the path to glory. It was in the field that the ingenious and the noble flattered most their pride, and acquired an afcendancy. The ftrength of their bodies, and the vigour of their counfels, furrounded them with warriors, and lifted them to command.

But, among these nations, when the individual felt the call of valour, and wished to try his strength against an enemy, he could not of his own authority take the lance and the javelin. The admission of their

KNELLER (Sir Godfrey), a painter, whose fame youth to the privilege of bearing arms, was a matter Knight. advanced to that honour.

> The council of the diffrict, or of the canton to which the candidate belonged, was affembled. His age and his qualifications were inquired into; and if he was deemed worthy of being admitted to the privileges of a foldier, a chieftain, his father or one of his kindred adorned him with a shield and the lance. In confequence of this folemnity, he prepared to diffinguish himself; his mind opened to the cares of the public; and the domestic concerns, or the offices of the family from which he had forung, were no longer the objects of his attention. To this ceremony, fo fimple and fo interesting, the institution of knighthood is in-

> debted for its rife. Knighthood, however, as a fyeftm, known under the denomination of CHIVALRY, is to be dated only from the 11th century. All Europe being reduced to a flate of anarchy and confusion on the decline of the house of Charlemagne, every proprietor of a manor or lordship became a petty fovereign; the mansionhouse was fortified by a moat, defended by a guard, and called a caftle. The governor had a party of 700 or 800 men at his command; and with these he used frequently to make excursions, which commonly ended in a battle with the lord of fome petty flate of the fame kind, whose caftle was then pillaged, and the women and treasures borne off by the conqueror. During this flate of universal hostility, there was no friendly communications between the provinces, nor any high roads from one part of the kingdom to another: the wealthy traders, who then travelled from place to place with their merchandise and their families, were in perpetual danger; the lord of almost every castle extorted fomething from them on the road; and at laft, some one more rapacious than the reft, seized upon the whole of the cargo, and bore off the women for his own ufe.

Thus caftles became the warehouses of all kinds of + rich merchandise, and the prisons of the distressed females whose fathers or lovers had been plundered or flain, and who being therefore feldom disposed to take the thief or murderer into favour, were in continual danger of a rape.

But as some are always distinguished by virtue in the most general defection, it happened that many lords infenfibly affociated to reprefs thefe fallies of violence and rapine, to fecure property, and protect the ladies. Among these were many lords of great fiefs; and the affociation was at length ftrengthened by a folemn vow, and received the fanction of a religious ceremony. As the first knights were men of the highest rank, and the largest possessions, such having . most to lose, and the least temptation to steal, the fratermity was regarded with a kind of reverence, even by those against whom it was formed. Admission into the order was deemed the highest honour; many extraordinary qualifications were required in a candidate, and many new ceremonies were added at his creation, After having fasted from fun-rife, confessed himfelf, and received the facrament, he was dreffed in a white tunie, and placed by himself at a side-table, where he was neither to fpeak, to fmile, nor to eat; while the

Society in Europe p. 46.

Knight. knights and ladies, who were to perform the principal parts of the ceremony, were eating, drinking, and making merry at the great table. At night his armour was conveyed to the church where the ceremony was performed; and here having watched it till the morning, he advanced with his fword hanging about his neck, and received the benediction of the prieft. He then kneeled down before the lady who was to put on his armour, who being affifted by perfons of the first rank, buckled on his fpurs, put an helmet on his head, and accoutred him with a coat of mail, a cuirafs, bracelets, cuiffes, and gauntlets.

Being thus armed cap-a-pee, the knight who dubhed him ftruck him three times over the shoulder with the flat fide of his fword, in the name of God, St Michael, and St George. He was then obliged to watch all night in all his armour, with his fword gird-ed, and his lance in his hand. From this time the knight devoted himself to the redrefs of those wrongs which "patient merit of the unworthy takes;" to fecure merchants from the rapacious cruelty of banditti, and women from ravishers, to whose power they were, by the particular confusion of the times, continually exposed.

From this view of the origin of chivalry, it will be easy to account for the castle, the moat, and the bridge, which are found in romances; and as to the dwarf, he was a constant appendage to the rank and fortune of those times, and no castle therefore could be without him. The dwarf and the buffoon were then introduced to kill time, as the card-table is at prefent. It will also be easy to account for the multitude of captive ladies whom the knights, upon feizing a caftle, fet at liberty; and for the prodigious quantities of useless gold and filver vessels, rich stuffs, and other merchandife, with which many apartments in these castles are faid to have been filled.

The principal lords who entered into the confraternity of knights, used to fend their fons to each other to be educated, far from their parents, in the myftery of chivalry. These youths, before they arrived at the age of 21, were called bachelors, or bas chevaliers, inferior knights, and at that age were qualified to receive the order.

So honourable was the origin of an inftitution, commonly confidered as the refult of caprice and the fource of extravagance; but which, on the contrary, rose naturally from the state of fociety in those times, and had a very ferious effect in refining the manners of the European nations. Valour, humanity, courtely, justice, honour, were its characteristics: and to these were added religion; which, by infufing a large portion of enthusiastic zeal, carried them all to a romantic excefs, wonderfully fuited to the genius of the age, and productive of the greatest and most permanent effects both upon policy and manners. War was carried on with less ferocity, when humanity, no less than courage, came to be deemed the ornament of knighthood, and knighthood a diffinction superior to royalty, and an honour which princes were proud to receive from the hands of private gentlemen: more gentle and polished manners were introduced, when courtefy was recommended as the most amiable of knightly virtues, and every knight devoted himself to the fervice of a lady; violence and oppression decreased, when it was felf to danger, declared himself the humble fervant of

accounted meritorious to check and to punish them : Knight. a scrupulous adherence to truth, with the most religious attention to fulfil every engagement, but particularly those between the fexes as more easily violated. became the diftinguishing character of a gentleman, because chivalry was regarded as the school of honour. and inculcated the most delicate fensibility with respect to that point; and valour, feconded by fo many motives of love, religion, and virtue, became altogether irrefistible.

That the spirit of chivalry sometimes rose to an extravagant height, and had often a pernicious tendency. must however be allowed. In Spain, under the influence of a romantic gallantry, it gave birth to a feries of wild adventures which have been defervedly ridiculed: in the train of Norman ambition, it extinguished the liberties of England, and deluged Italy in blood; and at the call of fuperstition, and as the engine of papal power, it defolated Afia under the banner of the crofs. But thefe ought not to be confidered as arguments against an institution laudable in itself, and neceffary at the time of its foundation : and those who pretend to despile it, the advocates of ancient barbarifm and ancient rufficity, ought to remember, that chivalry not only first taught mankind to carry the civilities of peace into the operations of war, and to mingle politeness with the use of the sword; but roufed the foul from its lethargy, invigorated the human character even while it fostened it, and produced exploits which antiquity cannot parallel. Nor ought they to forget, that it gave variety, elegance, and pleafure, to the intercourse of life, by making woman a more effential part of fociety; and is therefore intitled to our gratitude, though the point of honours and the refinements in gallantry, its more doubtful effects, should be excluded from the improvement of modern manners. For,

To illustrate this topic more particularly, we may observe, that women, among the ancient Greeks and Romans, feem to have been confidered merely as objects of fenfuality, or of domestic conveniency: they were devoted to a flate of feclusion and obscurity, had few attentions paid them, and were permitted to take as little share in the conversation as in the general commerce of life. But the northern nations, who paid a kind of devotion to the fofter fex, even in their native forests, had no fooner fettled themselves in the provinces of the Roman empire, than the female character began to assume new consequence. Those fierce barbarians, who feemed to thirst only for blood, who involved in one undiffinguishing ruin the monuments of ancient grandeur and ancient ingenuity, and who devoted to the flames the knowledge of ages, always forbore to offer any violence to the women. They brought along with them the respectful gallantry of the north, which had power even to restrain their savage ferocity; and they introduced into the west of Europe a generofity of fentiment, and a complaifance toward the ladies, to which the most polished nations of antiquity were strangers .- These fentiments of generous gallantry were foftered by the inflitution of chivalry, which lifted woman yet higher in the feale of life. Inflead of being nobody in fociety, she became is primum mobile. Every knight devoting himKnight. fome lady, and that lady was often the object of his love. Her honour was supposed to be intimately connected with his, and her imile was the reward of his valour: for her he attacked, for her he defended, and for her he shed his blood. Courage, animated by fo powerful a motive, loft fight of every thing but enterprife: incredible toils were cheerfully endured, incredible actions were performed, and adventures feemingly fabulous were more than realifed. The effect was reciprocal. Women, proud of their influence, became worthy of the heroifm which they had inspired: they were not to be approached but by the high-minded and the brave; and men then could only be admitted to the bosom of the chaste fair, after proving their fidelity and affection by years of perseverance and of

peril. Again, as to the change which took place in the operations of war, it may be observed, that the perfect hero of autiquity was superior to fear, but he made use of every artifice to annoy his enemy: impelled by animofity and hostile passion, like the savage in the American woods, he was only anxious of attaining his end, without regarding whether fraud or force were the means. But the true knight or modern hero of the middle ages, who feems in all his rencounters to have had his eye on the judicial combat or judgment of God, had an equal contempt for stratagem and danger. He disdained to take advantage of his enemy: he defired only to fee him, and to combat him upon equal terms, trufting that heaven would declare in behalf of the just ; and as he professed only to vindicate the cause of religion, of injured beauty, or oppressed innocence, he was further confirmed in this enthusiastic opinion by his own heated imagination. Strongly perfuaded that the decision must be in his favour, he fought as if under the influence of divine infpiration rather than of military ardour. Thus the fystem of chivalry, by a fingular

combination of manners, blended the heroic and fane- Knight tified characters, united devotion and valour, zeal and gallantry, and reconciled the love of God and of the

Chivalry flourished most during the time of the croifades. From these holy wars it followed, that new fraternities of knighthood were invented: hence the knights of the Holy Sepulchre, the Hofpitallers, Templars, and an infinite number of religious orders. Various other orders were at length inflituted by fovereign princes: the Garter, by Edward III. of England; the Golden Fleece, by Philip the Good, duke of Burgundy; and St Michael, by Louis XI. of France. From this time ancient chivalry declined to an empty name; when fovereign princes established regular companies in their armies, knights-bannerets were no more, though it was still thought an honour to be dubbed by a great prince or victorious hero; and all who professed arms without knighthood assu-

med the title of efquire. There is scarce a prince in Europe that has not thought fit to institute an order of knighthood; and the simple title of knight, which the kings of Britain confer on private subjects, is a derivation from ancient, chivalry, although very remote from its fource. See Knight-BACHELOR.

KNIGHT-Service (fervitium militare, and in law! French chivalry); a species of TENURE, the origin and nature of which are explained under the articles CHIVALRY, and FEODAL System, nº 13-21.

The knights produced by this tenure differed most effentially from the knights described in the preceding article; though the difference feems not to have been accurately attended to by authors (A). The one class of knights was of a high antiquity; the other was not heard of till the invention of a fee. The adorning with arms and the blow of the

⁽A) "The terms knight and chivaler (Dr Stuart " observes), denoted both the knight of bonour and " View of knight of tenure; and chivalry was used to express both knighthood and knight-fervice. Hence, it has proceeded, Society in hangin of tentre; and through was need to express both amounted. Yet the marks of their difference are fo firong and Europe, pointed, that one must wonder that writers should mistake them. It is not, however, mean and common 346. compilers only who have been deceived. Sir Edward Coke, notwithstanding his distinguishing head, is of this number. When estimating the value of the knight's fee at L. 20 per annum, he appeals to the statute de militibus, an. I Ed. II. and, by the fense of his illustration, he conceives, that the knights alluded to there were the fame with the possessor of knight's fees: and they, no doubt, had knight's fees; but a knight's fee might be enjoyed not only by the tenants in capite of the crown, but by the tenants of a vaffal, or by the tenants of a fub-vaffal. Now, to these the statute makes no allusion. It did not mean to annex knighthood to every land-holder in the kingdom who had a knight's fee; but to encourage arms, by requiring the tenants in capite of the crown to take to them the dignity. He thus confounds knighthood and the knight's fee. COKE on Littleton, p. 69.

[&]quot; If I am not deceived, Sir William Blackstone has fallen into the same mistake, and has added to it. Speaking of the knights of honour, or the equites aurati from the gilt fpurs they wore, he thus expresses himfelf: 'They are also called, in our law, milites, because they formed a part, or indeed the whole, of the royal army, in virtue of their feodal tenures; one condition of which was, that every one who held a knight's. 4 fee (which in Henry 11.'s time amounted to L. 20 per annum), was obliged to be knighted, and attend the 4 king in his wars, or fined for his noncompliance. The exertion of this prerogative, as an expedient to raise. money, in the reign of Charles I. gave great offence, though warranted by law, and the recent example of 4 Queen Elizabeth: but it was, at the reftoration, together with all other military branches of the feodal law, abolished; and this kind of knighthood has since that time fallen into great disrepute.' Book I. ch. 12.

[&]quot; After what has been faid, I need hardly observe, that this learned and able writer has confounded the knight of bonour and the knight of tenure; and that the requisition to take knighthood was not made to every polleffor of a knight's fee, but to the tenants of knight's fees held in capite of the crown, who had merely a fufficiency

Knight. fword made the act of the creation of the ancient knight; the new knight was conflituted by an inveftment in a piece of land. The former was the member of an order of dignity which had particular privileges and distinctions; the latter was the receiver of a feudal grant. Knighthood was an honour; knightfervice a tenure. The first communicated fplendor to an army; the last gave it strength and numbers. The knight of honour might ferve in any station whatever; the knight of tenure was in the rank of a foldier .- It is true at the same time, that every noble and baron were knights of tenure, as they held their lands by knight-fervice. But the number of fees they possessed, and their creation into rank, feparated them widely from the fimple individuals to whom they gave out grants of their lands, and who were merely the knights of tenure. It is no less true, that the fovereign, without conferring nobility, might give even a fingle fee to a tenant; and fuch vaffals in capite of the crown, as well as the vaffals of fingle fees from a fubject, were the mere knights of tenure. But the former, in respect of their holding from the crown, were to be called to take upon themfelves the knighthood of honour; a condition in which they might rife from the ranks, and be promoted to offices and command. And as to the vaffals in capite of the crown who had many fees, their wealth of itself sufficiently distinguished them beyond the flate of the mere knights of tenure. In fact, they possessed an authority over men who were of this last description; for, in proportion to their lands were the fees they gave out and the knights they commanded.

By the tenure of knight-service, the greatest part of the lands in England were holden, and that principally of the king in capite, till the middle of the laft century; and which was created, as Sir Edward Coke expressly testifies, for a military purpose, viz. for defence of the realm by the king's own principal fubjects, which was judged to be much better than to trust to hirelings or foreigners. The description here given is that of knight-fervice proper, which was to attend the king in his wars. There were also some other species of knight-fervice; fo called, though improperly, because the service or render was of a free and honourable nature, and equally uncertain as to the time of rendering as that of knight-fervice proper, and because they were attended with similar fruits and confequences. Such was the tenure by grand ferjeanty, per magnum fervitium, whereby the tenant was bound, instead of ferving the king generally in his wars, to do fome special honorary service to the king in person; as to carry his banner, his fword, or the like; or be his butler, champion, or other officer, at his coronation. It was, in most other respects, like knight-service, only he was not bound to pay aid or escuage; and when tenant by knight-fervice spaid five pounds for a relief on every-knight's fee, tenant by grand-Nº 172.

ferjeanty paid one year's value of his land, were it Knight. much or little. Tenure by cornage, which was to wind a horn when the Scots or other enemies entered the land, in order to warn the king's fubjects, was (like other services of the same nature) a species of grand-

These services, both of chivalry and grand-serieanty, were all personal, and uncertain as to their quantity or duration. But the perfonal attendance in knight-fervice growing troublesome and inconvenient in many respects, the tenants found means of compounding for it, by first fending others in their stead. and in process of time making a pecuniary fatisfaction to the lords in lieu of it. This pecuniary satisfaction at last came to be levied by affestments, at so much for every knight's fee; and therefore this kind of tenure was called foutagium in Latin, or fervitium fouti; foutum being then a well-known denomination of money: and in like manner it was called, in our Norman French. escuage; being indeed a pecuniary instead of a military service. The first time this appears to have been taken, was in the 5 Hen. II. on account of his expedition to Tolouse; but it foon came to be so universal, that personal attendance fell quite into disuse. Hence we find in our ancient histories, that, from this period when our kings went to war, they levied scutages on their tenants, that is on all the landholders of the kingdom, to defray their expences and to hire troops: and these affesiments in the time of Henry II. feem to have been made arbitrarily, and at the king's pleasure. Which prerogative being greatly abused by his fuccessors, it became matter of national clamour; and King John was obliged to confent, by his magna carta, that no feutage should be imposed without confent of parliament. But this clause was omitted in his fon Henry III.'s charter; where we only find, that foutages or escuage should be taken as they were used to be taken in the time of Henry II.; that is, in a reasonable and moderate manner. Yet afterwards, by statute 25 Edw. I. c. 5. & 6. and many fubfequent statutes, it was enacted, that the king fhould take no aids or tasks but by the common affent of the realm. Hence it is held in our old books, that escuage or scutage could not be levied but by consent of parliament; fuch scutages being indeed the groundwork of all fucceeding subsidies, and the land-tax of later times.

Since, therefore, escuage differed from knight-fervice in nothing but as a compensation differs from actual fervice, knight-fervice is frequently confounded with it. And thus Littleton must be understood. when he tells us, that tenant by homage, fealty, and escuage, was tenant by knight-fervice : that is, that this tenure (being fubfervient to the military policy of the nation) was respected as a tenure in chivalry. But as the actual fervice was uncertain, and depended upon emergencies, fo it was necessary that this pecuniary

fufficiency to maintain the dignity, and were thence disposed not to take it. The idea that the whole force of the royal army confifted of knights of honour, or dubbed knights, is so extraordinary a circumstance, that it might have shown of itself to this eminent writer the fource of his error. Had every soldier in the feudal army received the investiture of arms? could he wear a feal, surpass in filk and cess, use entigns armorial, and enjoy all the other privileges of knighthood? But, while I hazard these remarks, my reader will observe, that it is with the greatest deserence I distent from Sir William Blackstone, whose abilities are the object of a most general and deferved admiration."

Blackft. Comment. KNI

compensation should be equally uncertain, and depend on the affeffments of the legislature suited to those emergencies. For had the escuage been a settled invariable fum, payable at certain times, it had been neither more nor less than a mere pecuniary rent; and the tenure, instead of knight service, would have then been of another kind, called socage.

By the degenerating of knight fervice, or personal military duty, into escuage or pecuniary assessments, all the advantages (either promifed or real) of the feodal constitutions were destroyed, and nothing but the hardships remained. Instead of forming a national militia composed of barons, knights, and gentlemen, bound by their interest, their honour, and their oaths, to defend their king and country, the whole of this fystem of tenures now tended to nothing else but a wretched means of raising money to pay an army of occasional mercenaries. In the mean time the families of all our nobility and gentry groaned under the intolerable burdens which (in confequence of the fiction adopted after the conquest) were introduced and laid upon them by the fubtlety and finesse of the Norman lawyers. For, befides the scutages to which they were liable in defect of personal attendance, which, however, were affeffed by themselves in parliament, they might be called upon by the king or lord paramount for aids, whenever his eldeft fon was to be knighted, or his eldest daughter married; not to forget the ranfom of his own person. The heir, on the death of his ancestor, if of full age, was plundered of the first emoluments arising from his inheritance, by way of relief and primer feifin; and if under age, of the whole of his estate during infancy. And then, as Sir Thomas Smith very feelingly complains, "when he came to his own, after he was out of wardlbib, his woods decayed, houses fallen down, flock wasted and gone, lands let forth and ploughed to be barren," to make amends, he was yet to pay half a year's profits as a fine for fuing out his livery; and also the price or value of his marriage, if he refused such wife as his lord and guardian had bartered for, and imposed upon him; or twice that value, if he married another woman. Add to this, the untimely and expensive honour of knighthood, to make his poverty more completely splendid. And when, by these deductions, his fortune was fo shattered and ruined, that perhaps he was obliged to fell his patrimony, he had not even that poor privilege allowed him, without paying an exorbitant fine for a licence of alienation.

A flavery fo complicated and fo extensive as this, called aloud for a remedy in a nation that boafted of her freedom. Palliatives were from time to time applied by fucceffive acts of parliament, which affuaged fome temporary grievances. Till at length the humanity of King James I. confented, for a proper equivalent, to abolish them all, though the plan then proceeded not to effect; in like manner as he had formed a scheme, and began to put it in execution, for removing the feodal-grievance of heritable jurisdictions in Scotland, which has fince been purfited and effected by the statute 20 Geo. II. c. 43. King James's plan for exchanging our military tenures feems to have been party. nearly the same as that which has been since pursued; only with this difference, that by way of compen- commonly carved like a man's head, Laving four shi-

Vol. IX. Part II.

would fustain, an annual fee farm rent should be fet. Knights, tled and infeparably annexed to the crown, and affured to the inferior lords, payable out of every knight's fee within their respective seignories. An expedient, feemingly much better than the hereditary excise which was afterwards made the principal equivalent for these concessions. For at length the military tenures, with all their heavy appendages, were deftroyed at one blow by the statute 12 Car. II. c. 24. which enacts, " that the court of ward or liveries, and all wardships, liveries, primer seisins, and ousterlemains, values and forfeitures of marriages, by reafon of any tenure of the king or others, be totally taken away. And that all fines for alienations, tenures by homage, knights fervice, and escuage, and also aids for marrying the daughter or knighting the fon, and all tenures of the king in capite, be likewise taken away. And that all forts of tenures, held of the king or others, be turned into free and common foccage; fave only tenures in frankalmoign, copyholds, and the honorary fervices (without the flavish part) of grandferjeanty." A statute which was a greater acquisition to the civil property of this kingdom than even magna carta itself: fince that only pruned the luxuriances that had grown out of the military tenures, and thereby preferved them in vigour; but the statute of King Charles extirpated the whole, and demolished both root and branches.

KNIGHTS-Errant. During the prevalence of chivalry, the ardour of redreffing wrongs seized many knights fo powerfully, that, attended by efquires, they wandered about in fearch of chiects whose miffortunes and mifery required their affiftance and fuccour. And as ladies engaged more particularly their attention, the relief of unfortunate damfels was the atchievement they most courted. This was the rife of knights-errant, whose adventures produced romance. These were originally told as they happened. But the love of the marvellous came to interfere; fancy was indulged in her wildest exaggerations; and poetry gave her charms to the most monstrous fictions, and to scenes the most unnatural and gigantic. See KNIGHT.

KNIGHT-Bachelor. See BACHELOR. KNIGHT-Baronet. See BARONET.

KNIGHTS of the Shire, or Knights of Parliament, are two gentlemen of worth, chosen on the king's writ in pleno comitatu, by fuch of the freeholders of every county as can expend 40 s. per annum, to reprefent fuch county in parliament. These, when every man who held a knights-fee in capite of the crown was cuttomarily conftrained to be a knight, were of necessity to be milites gladio cinti, for fo the writ runs to this day; but now custom admits esquires to be chosen to this office. They must have at least 500 l. per annum : and their expences are to be defrayed by the county, though this be feldom now required.

KNIGHT-Marsbal, an officer in the king's household, who has jurifdiction and cognizance of any transgreffion within the king's household and verge; as also of contracts made there, whereof one of the house is

KNIGHTS, in a ship, two short thick pieces of wood. fation for the lofs which the crown and other lords vers in each, three for the halyards, and one for the 3 P

Knighte top to run in: one of them stands fast bolted on the hood, beams abase the foremast, and is therefore called the Knightlow. fore-knight; and the other, standing abase the main-implet.

KNIGHPHOOD, a military order or honour, or a mark or degree of ancient nobility, or reward of

perfonal virtue and merit.

There are four kinds of knighthood; military, re-

gular, honorary, and focial.

Military Киюнтноор, is that of the ancient knights, who acquired it by high feats of arms. They are called militae, in ancient charters and titles, by which they were diftinguished from mere bachelors, &c. These knights were girt with a sword, and a pair of gilt spurs, whence they were called equites aurai.

Knighthood is not hereditary, but acquired. It does not come into the world with a man like nobility, nor can it be revoked. The fons of kings, and kings themselves, with all other fovereigns, heretofore had knighthood conferred on them as a mark of honour. They were usually knighted at their baptism or marriage, at their coronation, before or after a battle, &c.

Regular KNIGHTHOOD, is applied to all military orders which profess to wear fome particular habit, to bear arms against the insidels, to succour and assist pagrims in their passage to the Holy Land, and to serve in hospitals where they should be received; such were the knights templars, and such still are the knights of Malta, &c.

Honorary KNIGHTBOOD, is that which princes confer on other princes, and even on their own great miniflers and favourites; fuch are knights of the Carter, Bath, St Patrick, Nova Scotia, Thifile, &c. See thefe articles; and for a reprefentation of their different infignia, fee Plate CCLVIII.

Social KNIGHTHOOD, is that which is not fixed nor confirmed by any formal infitution, nor regulated by any lafting flatutes; of which kind there have many orders been erected on occasion of factions, of tilts and tour-

naments, masquerades, and the like.

The abbot Bernardo Justiniani, at the beginning of his History of Knighthood, gives us a complete catalogue of the feveral orders: according to this computation, they are in number 92. Favin has given us two volumes of them under the title of Theatre d'Honneur & de Chévalerie. Menenius has published Delicia Equestrium Ordinum, and Andr. Mendo has written De Ordinibus Militaribus. Beloi has traced their original; and Geliot, in his Armorial Index, has given us their inflitutions. To these may be added, Father Meneftrier de la Chevalerie Ancienne & Moderne. Michieli's Trefor Militaire, Caramuel's Theologia Regolare, Miræus's Origines Equestrium five Militarium Ordinum: but above all, Justinian's Historie Chronologiche dell'Origine de gl Ordine Militari, e di tutte le Religione Cavaleresche; the edition which is fullest is that of Venice in 1692, in two vols. fol.

KNEHTLOW Hill, or Caoss, which gives name to a hamlet in Warwickfhire, flands in the road from Coventry to London, at the entrance of Dunfmore-Heath, About 40 towns in this hamlet, which are fpecified by Dugdale, are obliged, on the forfeiture of 30 a and a white bull, to pay a certain rent to the lord of the hamlet, called wrath money, or fourtf-gum; which mult

be deposited every Martinmas-day in the morning at Knighton this cross before sun-rife; when the party paying it must go thrice about the cross, and fay the wrothmoney, and then lay it in the hole of the said cross before good witness.

KNIGHTON, a well built town of Radnorshire in South Wales, 155 miles from London. It is pleafantly fituated on an elevation rifing from a small river, which divided this part of Wales from Shropshire. It carries on a considerable trade, and has a market and

KNIGHTSBRIDGE, a village of Middlefex, and the first village from London in the great wellern road. It lies in the patisles of St Margaret's Wellminder, and St George by Hanover Square; and has a chapel, which is nevertheles independent. At the entrance of it from London stands that noble infirmary for fick and wounded, called St George's Hophida, erected and maintained by the contributions of our nobility and gentry, of whom there are no lefs than 200 governors. In the centre of this village, there is a fabric lately erected, where is carried on one of the most confiderable manufactures in England for painting floor-cloths,

KNOCTOPHER, a borough and market town of Ireland in the county of Kilkenny and province of Leinster, 63 miles from Dublin. It returns two members to parliament; patronage in the families of Langrishe and Ponsonby.

KNOLL, a term used in many parts of the kingdom for the top of a small hill, or for the hill itself.

KNOLLES (Richard), was born in Nothamptonshire, about the middle of the 16th century, and educated at Oxford, after which he was appointed mafter of the free-school at Sandwich in Kent. He composed Grammatice Latine, Graca, et Hebraica, compendium, cum radicibus, London 1606; and fent a great number of well grounded scholars to the universities. He also frent 12 years in compiling a history of the Turks: which was first printed in 1610, and by which he has perpetuated his name. In the later editions it is called, The general history of the Turks, from the first beginning of that nation to the rifing of the Ottoman family, &c. He died in 1610, and this history has been fince continued by feveral hands: the best continuation is that by Paul Ricaut conful at Smyrna, folio, London 1680. Knolles wrote alfo, "The lives and conquetts of the Ottoman kings and emperors to the year 1610;" which was not printed till after his death in 1621, to which time it was continued by another hand; and laftly, A brief discourse of the greatness of the Turkish empire, and wherein the greatness of the strength thereof confifteth, &c."

KNOT, a part of a tree, from which shoots out branches, roots, or even fruit. The use of the knots is, to strengthen the stem; they serve also as searces, to filtrate, purify, and refine the juices raised up for

the nourishment of the plant.

Knors of a Rope, among feamen, are diftinguished into three kinds, viz. whole knot, that made io with the lays of a rope that it cannot flip, ferving for sheets, tacks, and stoppers: bow-line knot, that so firmly made and fastened to the cringles of the falls, that they must break or the fail split before it slips:

and

Knox.

without cutting it, which may be prefently loofened, and the rope not the worfe for it.

KNOTS of the Log-line, at fea, are the divisions of it.

See the article Log. KNOT, in ornithology. See TRINGA.

KNOT-Grass, or Bistort. See POLYGONUM.

KNOT (Edward), born in Northumberland in England, entered among the Jesuits at the age of 26, being already in priest's orders. This happened in the year 1606. He taught a long time at Rome in the English college; and was afterwards appointed fub-provincial of the college of England, and was fent provincial thither. He was twice honoured with that employment. He was prefent as provincial at the general affembly of the order of the Jesuits held at Rome in 1646, and was chosen definitor. He died in 1696. He published several pieces; among the rest, Mercy and Truth, or Charity maintained by the Catholics; against Dr Potter, who had charged the church of Rome with wanting charity, because she afferts that a man cannot be faved in the Protestant communion.

KNOTTESFORD, a town of Cheshire, near the Merfey, 184 miles from London, is divided into the upper and lower towns by a rivulet called Bicken. In the former is the church; and in the latter is a chapel of ease; the market and town-house. It has a market

and three fairs

KNOTTINGLEY, a town in the west riding of Yorkshire, on the Aire near Ferrybridge, is noted for its merchandize in lime. The stones of which it is made are dug up plentifully at Elmet, and here burnt; from whence it is conveyed at certain feafons in great quantities to Wakefield, Sandal, and Standbridge, for fale, and so carried into the western parts of the county for

KNOUT, the name of a punishment inflicted in Ruffia, with a kind of whip called knout, and made of a long strap of leather prepared for this purpose. With this whip the executioners dexteroufly carry off a flip of skin from the neck to the bottom of the back laid bare to the waift, and repeating their blows, in a little while rend away all the skin off the back in parallel ftrips. In the common knout the criminal receives the lashes suspended on the back of one of the executioners: but in the great knout, which is generally used on the same occasions as racking on the wheel in France. the criminal is raifed into the air by means of a pully fixed to the gallows, and a cord fastened to the two wrifts tied together; a piece of wood is placed between his two legs also tied together; and another of a crucial form under his breaft. Some times his hands are tied behind over his back; and when he is pulled up in this position, his shoulders are diflocated. The executioners can make, this punishment more or less cruel: on that account was exposed to continual insults from and it is faid, are so dexterous, that when a criminal is condemned to die, they can make him expire at pleafure either by one or feveral lashes.

KNOWLEDGE, is defined by Mr Locke to be the perception of the connection and agreement or freedom. In the year 1571 our reformer was obliged

TAPHYSICS and Logic.

Knots and theep thank knot, that made by thortening a rope St Andrew's, where he took a degree in arts, and Know commenced teacher very early in life. At this time the new religion of Martin Luther was but little known in Scotland; Mr Knox therefore at first was a zealous Roman-catholic: but attending the fermons of a certain black friar, named Guialliam, he began to waver in his opinions; and afterwards converfing with the famous Wishart, who in 1544 came to Scotland with the commissioners fent by Henry VIII. he renounced the Romish religion, and became a zealous reformer. Being appointed tutor to the fons of the lairds of Ormifloun and Langniddery, he began to instruct them in the principles of the Protestant religion; and on that account was fo violently perfecuted by the bishop of St Andrew's, that with his two pupils he was obliged in the year 1547 to take shelter in the castle of that place. But the caftle was befieged and taken by 21 French galleys. He continued a prisoner on board a galley two years, namely, till the latter end of the year 1549; when being fet at liberty, he landed in England, and having obtained a licence, was appointed preacher, first at Berwick, and afterwards at Newcaltle. Strype conjectures that in 1552 he was appointed chaplain to Edward VI. He certainly obtained an annual pension of 40 L and was offered the living of Allhallows in London; which he refused, not choosing to conform to the liturgy.

Soon after the accession of Oueen Mary, he retired to Geneva; whence, at the command of John Calvin. he removed to Francfort, where he preached to the exiles: but a difference arifing on account of his refufing to read the English liturgy, he went back to Geneva; and from thence in 1555 returned to Scotland, where the reformation had made confiderable progress during his absence. He now travelled from place to place, preaching and exhorting the people with unremitting zeal and refolution. About this time (1556), he wrote a letter to the queen regent, carneftly intreating her to hear the Protestant doctrine; which letter she treated with contempt. In the same year the English Calvinists at Geneva invited Mr Knox to refide among them. He accepted their invitation. Immediately after his departure from Scotland, the bishop summoned him to appear, and he not appearing, condemned him to death for herefy, and burnt

his effigy at the crofs of Edinburgh.

Our reformer continued abroad till the year 1550. during which time he published his "First blast against the monftrous regiment of women." Being now returned to Scotland, he refumed the great work of reformation with his usual ardour, and was appointed minister at Edinburgh. In 1561 Queen Mary arrived from France. She, it is well known, was bigotted to the religion in which she had been educated; and her reformed fubjects. Mr Knox himself frequently insulted her from the pulpit; and when admitted to her presence, regardless of her sex, her beauty, and her high rank, behaved to her with a most unjustifiable difagreement and repugnancy of our ideas. See Me- to leave Edinburgh, on account of the confusion and danger from the opposition to the earl of Lenox, then KNOX (John), the hero of the reformation in regent; but he returned the following year, and re-Scotland, was born in 1505, at Gifford near Hadding. fumed his pattoral functions. He died at Edinburgh ton in East Lothian; and educated at the university of in November 1572, and was buried in the clurch-yard

Knox mation was printed with his other works at Edin. Mierælius. Knutzen. burgh in 1584, 1586, 1644, 1732. He published

many other pieces; and feveral more are preferved in Calderwood's History of the Church of Scotland. He left also a considerable number of manuscripts, which in 1732 were in the possession of Mr Woodrow, mini-

fler of Eastwood.

As to his character, it is eafily understood, not withflanding the extreme diffimilitude of the two portraits drawn by Popish and Calvinistical pencils. According to the first, he was a devil; in the ideas of the latter, an angel. He was certainly neither. The following character is drawn by Dr Robertson. "Zeal, intrepidity, difinterestedness, were wirtues that he possessed in an eminent degree. He was acquainted too with the learning cultivated in that age; and excelled in that species of eloquence which is calculated to rouse and to inflame. His maxims, however, were often too fevere, and the impetuofity of his temper excessive. Rigid and uncomplying, he showed no indulgence to the infirmities of others. Regardless of the diftinctions of rank and character, he uttered his admonitions with an acrimony and vehemence more apt to irritate than to reclaim; and this often betrayed him into indecent expressions, with respect to Queen Mary's perfon and conduct. Those very qualities, however, which now render his character less amiable, fitted him to be the instrument of Providence for advancing the reformation among a fierce people, and enabled him to face dangers, and to furmount opposition, from which a person of a more gentle spirit would have been apt to fhrink back. By an unwearied application to fludy and to bufiness, as well as by the frequency and fervour of his public difcourfes, he had worn out a conftitution naturally strong. During a lingering illness, he discovered the utmost sortitude; and met the approach of death with a magnanimity infeparable from his character. He was constantly employed in acts of devotion, and comforted himfelf with those prospects of immortality, which not only preferve good men from desponding, but fill them with exultation in their last moments. The earl of Morton, who was present at his funeral, pronounced his eulogium in a few words, the more honourable for Knox, as they came from one whom he had often cenfured with peculiar feverity; " Here lies he who never feared the face of man."

KNOXIA, in botany: A genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 47th order, Stellata. The corolla is monopetalous, and funnelfhaped; there are two furrowed feeds; the calyx has

one leaf larger than the reft.

KNUTZEN (Matthias), a native of Holstein, the only person on record who openly professed and taught atheism. It is said he had about 1000 disciples in different parts of Germany. They were called Conscienciaries, because they afferted there is no other God, no other religion, no other lawful magistracy, but conscience, which teaches every man the three fundamental principles of the law of nature :- To hurt

of St Giles's in that city. -His History of the Refor- fystem. It is to be found entire in the last edition of Koedoe Koempfer

KOEDOE. See CAPRA.

KOEI-TCHEOU, a province of China, and one of the smallest in the kingdom. On the fouth it has Quang-fi, on the east Hou-quang, on the north Setchuen, and Yun-nan on the west. The whole country is almost a defert, and covered with inaccessible mountains; it may justly be called the Siberia of China. The people who inhabit it are mountaineers, accustomed to independence, and who feem to form a feparate nation: they are no less ferocious than the favage animals among which they live .- The mandarins and governors who are fent to this province are sometimes diffraced noblemen, whom the emperor does not think proper to discard entirely, either on account of their alliances, or the fervices which they have rendered to the state : numerous garrisons are entrusted to their charge, to over-awe the inhabitants of the country; but these troops are found insufficient, and the court despairs of being ever able thoroughly to subdue these untractable mountaineers .- Frequent attempts have been made to reduce them to obedience, and new forts have from time to time been erected in their country; but the people, who are not ignorant of those defigns, keep themselves that up among their mountains, and feldom iffue forth but to destroy the Chinese works or ravage their lands .- Neither filkfluffs nor cotton cloths are manufactured in this province; but it produces a certain herb much refembling our hemp, the cloth made of which is used for summer dreffes. Mines of gold, filver, quickfilver, and copper, are found here; of the last metal, those small pieces of money are made which are in common circulation throughout the empire.-Koei-tcheou contains 10 cities of the first class, and 38 of the second and third.

KOEMPFER (Engelbert), was born in 1651 at Lemgow in Westphalia. After studying in several towns, he went to Dantzick, where he gave the first public specimen of his proficiency by a differtation De majestatis divisione. He then went to Thorn; and from thence to the university of Cracow, where he took his degree of doctor in philosophy; after which he went to Koningsberg in Prussa, and staid there four years. He next travelled into Sweden, where he foon began to make a figure, and was appointed fecretary of the embaffy to the fophi of Persia. He set out from Stockholm with the prefents for that emperor; and went through Aaland, Finland, and Ingermanland, to Narva, where he met Mr Fabricius the ambaffador, who had been ordered to take Moscow in his way. The ambaffador having ended his negociations at the Ruffian court, fet out for Perfia. During their ftay, two years, at Ispahan, Dr Koempfer, whose curious and inquilitive disposition suffered nothing to escape him unobserved, made all the advantages possible of fo long an abode in the capital of the Persian empire. The ambaffador, towards the close of 1685, preparing to return into Europe, Dr Kæmpfer chose rather to enter into the fervice of the Dutch East India company, in quality of chief furgeon to the fleet, then nobody, to live honeftly, and to give every one his cruifing in the Persian Gulph. He went aboard the due. Several copies of a letter of his from Rome fleet, which, after touching at many Dutch settlements, were spread abroad, containing the substance of his came to Batavia in September 1689. Dr Kæmpfer

he fet out for Japan, in quality of physician to the embaffy which the Dutch East India company fends once a year to the Japanese court. He quitted Japan to return to Europe in 1602. In 1604 he took his degree of doctor of physic at Leyden; on which occasion he communicated, in what are called Inaugural Thefes, ten very fingular and curious observations

made by him in foreign countries. He intended to digest his memoirs into proper order; but was prevented, by being made physician to the count de Lippe. He died in 1716. His principal works are, 1. Amenitates Exotice, in 4to; a work which includes many curious and ufeful particulars in relation to the civil and natural history of the countries through which he passed. 2. Herbarium Ultra-Gangeticum. 3. The history of Japan, in German, which is very curious and much effeemed; and for which the public is indebted to the late Sir Hans Sloane, who purchased for a confiderable fum of money all our author's curiofities, both natural and artificial, as likewife all his drawings and manuscript memoirs, and prevailed with the late learned Dr Scheuchzer to translate the Japanese hiftory into English.

KÆMPFERIA. See KEMPFERIA.

KOENIG (Samuel), a learned philosopher and mathematician, was professor of philosophy at Franeker, and afterwards at the Hague, where he became librarian to the Stadtholder, and died there in 1757. He wrote feveral works which are esteemed.

KOENIGIA, in botany; a genus of the trigynia order, belonging to the triandria class of plants. The calvx is triphyllous; there is no corolla; and but one

ovate and naked feed.

KONGSBERG, a town of Norway, belonging to Denmark, and celebrated for its filver mines, whose produce has been considerably exaggerated by most of the travellers that have published on this subject. The town, which stretches on both sides the river Lowe, contains about 1000 houses, and including the miners 6000 inhabitants. The mines, which lie about two miles from the town, were first discovered and worked during the reign of Christian IV.; and of their prefent state the following account is given by Mr Coxe +. There are 36 mines now working; the deepest where-of called Segen-Gottes in der North, is 652 feet perpendicular. The matrix of the ore is the faxum of Linneus. The filver is extracted according to the usual process, either by smelting the ore with lead or by pounding. The pure filver is occasionally found in fmall grains and in small pieces of different fizes, feldom weighing more than four or five pounds. Sometimes, indeed, but extremely rare, masses of a considerable bulk have been discovered; and one in particular which weighed 409 marks, and was worth 3000 rix-dollars, or 600 l. This piece is fill preferved in the cabinet of curiofities at Copenhagen. Formerly these mines produced annually 350,000 rix-dollars, or 70,000 l.; and in 1769, even 79,000l; at prefent they feldom yield only from 50,000 l. to 54,000 l. Formerly above 4000 men were necessary for working the mines, fmelting and preparing the ore; but a few years ago 2400 miners were removed to the cobalt works lately established at Fosfum and to other mines,

ampferia here applied himself chiefly to natural history. Hence and other reductions, the expense, which was before Konig, estimated at 57 ol. per month, now amounts to only K sin there 4400 l. or about \$2,800 l. per annum. Yet even with this diminution the expences generally equal, and fometimes exceed, the profits. Government, therefore, draws no other advantage from these mines, than by giving employment to fo many perfons, who would be otherwise incapable of gaining their livelihood, and by receiving a certain quantity of specie, which is much wanted in the prefent exhaulted state of the finances in Denmark. For such is the deficiency of specie, that even at Kongsberg itself change for a bank note is with difficulty obtained. The miners are paid in small bank notes, and the whole expences are defrayed in paper currency. The value of 13,000 rix-dollars, or 2600 l. in block filver is annually fent to Copenhagen; the remainder of the ore is coined in the mint of Kongsberg, and transferred to Copenhagen. The largest piece of money now thruck at Kongfberg is only eight skillings or four pence.

KONIG (George Matthias), a learned German, born at Altorf in Franconia in 1616. He became profesfor of poetry and of the Greek tongue there, and librarian to the university; in which last office he fucceeded his father. He gave feveral public specimens of his learning; but is principally known for a Biograghical Dictionary, intitled, Bibliotheca vetus et nova, 4to, Altorf, 1674: which, though it is very defective, is useful to biographers. He died in 1699.

Konig (Emanuel), a learned physician of Basil, born in that city in 1658, whose medicinal works were fo esteemed in Switzerland, that he was considered as a second Avicenna. He died at Basil in 1731.

KONINGSBERG, a town of Poland, and capital of Regal Pruffia, with a magnificent palace, in which is a hall 274 feet long and 59 broad without pillars to support it, and a handsome library. It is about five miles in circumference; and including the garrifon of 7000 men contains 60,000 inhabitants. The town house, the exchange, and the cathedral church, are all very fine structures. The tower of the castle is exceeding high; and has 284 steps to go to the top, from whence there is a very diftant prospect. There are 18 churches in all; of which 14 belong to the Lutherans, three to the Calvinifts, and one to the Papifts. It flands on the Pregel, a navigable river which flows from the north-western provinces of Poland, and here falls into the eaftern extremity of the Frische Haf. an inlet of the Baltic. No ships drawing more than feven feet water can pass the bar and come up to the town; fo that the large veffels anchor at Pillau, a fmalltown on the Baltic, which is the port of Konigsberg; and the merchandise is sent in smaller vessels to this place. Its trade is very confiderable - Konigfberg contains an university founded by Albert of Brandenburgh. According to the original endowment there were 40 professors; but their number is now reduced to 16. Each professor receives a salary of about 50l. per annum, which may be increased by private lectures. In 1775, the university contained 800 students, of whom 200 are lodged and boarded at the expence of the crown. There are three public libraries in the town, the royal or univerfity library, the town library, and the Wallenrodt library, fo called because it was given by Martienand the number is now reduced to 2500. By these von Wallenrodt, in 1650. E. L. 21. 35. N. L. 54. 43

HOMETANISM.

next article.

KORIACS, a people inhabiting the northern part of Kamtchatka, and all the coast of the Eastern Ocean from thence to the Anadir.-They are divided into the Rein-deer or Wandering Koriacs, and the Fixed Koriacs. The former lead an erratic life, in the tract bounded by the Penschinska sea to the south-east, the river Kowyma to the west, and the river Anadir to the north. They wander from place to place with their rein-deer, in fearch of the moss, the food of those animals, which are their only wealth. They are fqualid, cruel, and warlike; the terror of the Fixed Koriacs as much as the Tschutski are of them. They never frequent the fea, nor live on fish. Their habitations are jourts, or places half funk in the earth; and they never use balagans or summer-houses elevated on posts like the Kamtchatkans. They are in their perions lean, and very short; have small heads and black hair, which they shave frequently: their faces are oval; their nofe is fhort; their eyes are fmall; their mouth is large; and their beard black and pointed, but often eradicated .- The fixed Koriacs are likewise short ; but rather taller than the others, and ftrongly made: the Anadir is also their boundary to the north, the ocean to the east, and the Kamtchatkans to the fourh. They have few rein-deer, which they use in their fledges; but neither of the tribes of Koriacs are civilized enough to apply them to the purposes of the dairy. Each speak a different dialect of the same language: but the Fixed in most things resemble the Kamtchatkans; and, like them, live almost entirely on fish. They are timid to a high degree, and behave to their wandering brethren with the utmost submission; who call them by a name which fignifies their flaves. These poor people seem to have no alternative : for. by reason of the scarcity of rein deer, they depend on these tyrants for the effential article of cloathing .-Thefe two nations Mr Pennant Supposes, from their features, to be the offspring of Tartars, which have spread to the east, and degenerated in fize and strength by the rigour of the climate, and often by fcarcity of

KOS, in Jewish antiquity, a measure of capacity, containing about four cubic inches: this was the cup of bleffing out of which they drank when they gave thanks after folemn meals, like that of the paffover.

KOTTERUS (Christopher), was one of the three fanatics whose visions were published at Amsterdam in 1657, with the title of Lux in tenebris. He lived He fancied he saw an angel under the form of a man, return from Constantinople he settled at Antwerp, who commanded him to go and declare to the magiftrates, that, unless the people repented, the wrath of hemia, was introduced in these visions. Kotterus into the Flemish tongue. He died in 1550. waited on him at Breslaw in December 1620, and informed him of his commission. He went to several not the son of a shepherd, as the authors of the Eng-

KORAN, or ALCORAN. See ALCORAN and MA. him feized, fet on the pillory, and banished the em- Kou-chu peror's dominions. Upon this he went to Lufatia, Kouli-khan KOREKI, the country of the Koriacs. See the and there lived unmoletted till his death, which happened in 1647.

KOU-CHU, a Chinese shrub, which bears a great refemblance to the fig-tree both in the make of its branches and the form of its leaves. From its root Grober's feveral twigs or shoots generally spring up, which form China, vol. in a kind of bush; but sometimes it consists of only one p. 486. fhoot. The wood of the branches of the kou-chu is foft and spongy, and covered with bark like that of the fig-tree. Its leaves are deeply indented, and their colour and the texture of their fibres are exactly the same as those of the fig-tree; but they are larger

and thicker, and much rougher to the touch. This tree yields a kind of milky juice, which the Chinese use for laying on gold-leaf in gilding. They make one or more incifions in the trunk, into which they infert the edges of a shell, or something else of the fame kind, to receive the fap. When they have extracted a fufficiency, they use it with a small brush, and delineate whatever figures they intend for the de-coration of their work. They then lay on the goldleaf, which is fo ftrongly attracted by this liquor, that it never comes off.

KOUANIN, in the Chinese language, the name of a tutelary deity of women. The Chinese make great numbers of the figures of this deity in white porcelain, and fend them to all parts of the world, as well as keep them in their own houses. The figure reprefents a woman with a child in her arms. The women who have no children pay a fort of adoration to thefe images, and suppose the deity they represent to have power to make them fruitful. The flatue always reprefents a handsome woman very modeftly attired.

KOUC, or KOECK (Peter), an excellent painter in the 16th century, was born at Aloft, and was the difciple of Bernard Van Orley, who lived with Raphael. He went to Rome; and by studying the beautiful pieces which he found there, formed an excellent tafte, and became a very correct defigner. On his return to his own country, he undertook the office of directing the execution of fome tapeftry work after the defigns of Raphael. He was afterwards perfuaded by some merchants of Bruffels to undertake a voyage to Conftantinople; but when he came there, finding that the Turks were not allowed by their religion to draw any figure, and that there was nothing for him to do but to draw defigns for tapettry, he spent his time in defigning the particular prospects in the neighbourhood of Constantinople, and the manner of the Turks living; of which he has left many wooden cuts, that at Sprotta in Silefia, and his visions began in 1616. alone suffice to give an idea of his merit. After his where he drew feveral pictures for the emperor Cha. V. He was also a good architect; and, in the latter part God would make dreadful havock. The elector pala- of his life, wrote A Treatife of Sculpture, Geometry, tine, whom the Protestants had declared king of Bo- and Perspective; and translated Vitruvius and Serliv

other places, and at last to the court of Brandenburg. lish Biographical Dictionary affert; his father being As most of these predictions promised felicity to the chief of a branch of the tribe of Affichars, and goverelector palatine, and unhappiness to his imperial ma- nor of a fortress erected by that people against the jefty, the emperor's fifcal in Silesia and Lufatia got Turks. Upon his father's death, his uncle usurped Kouli-khan, his government, under the pretext of taking care of tars it has been borrowed by the Ruffians who use it Koumis. Koumifs. it during the minority of Kouli-Khan; or, more pro-

perly, young Nadir. Difguit at this affront made him commence adventurer. He entered into the fervice of Beglerberg, governor of Mulchada, in the Khorasan; who, discovering in him strong marks of a military genius, promoted him to the command of a regiment of cavalry. In 1720, the Usbec Tartars having made an irruption into the Khorasan with 10,000 men, Beglerberg, whose whole force consisted only of 4000 horse and 2000 infantry, called a council of war, in which it was declared imprudent to face the enemy with fuch an interior force: but Kouli-Khan proposed to march against the enemy, and engaged to conduct the expedition, and to be answerable for the fuccess of it. He was accordingly made general; defeated the Tartars, and took their commander prifoner. Hoffein Begleiberg received him at his return with marks of diffinction : but growing jealous of his rifing fame, inftead of obtaining him the rank of lieutenant-general of the Khorafan, as he had promifed, obtained it for another; which fo exasperated Kouli Khan, that he publicly complained of the governor's ingratitude and perfidy; who thereupon broke him, and ordered him to be punished with the baltinado fo feverely, that the nails of his great toes fell off. This affront occasioned his flight, and his joining a banditti of robbers (not his stealing his father's or his neighbour's sheep). The rest of his adventures are too numerous to be inferted in this work. In 1729 he was made general of Persia by Schah Thamas, and permitted to take his name Thamas, and that of Khuli, which fignifies flave: his title therefore was, The flave of Thamas; but he was ennobled by the addition of Khan. In 1736, he fomented a revolt against his mafter, for having made an ignominious peace with the Turks; and having the army at his command, he procured his deposition, and his own advancement to the throne. In 1739 he conquered the Mogul empire; and from this time growing as cruel as he was ambitious, he at length met with the usual fate of tyrants, being affaffinated by one of his generals, in league with his nephew and fucceffor, in 1747, aged

KOUMISS, a fort of wine made in Tartary, where it is used by the natives as their common beverage during the feafon of it, and often ferves them inflead of all other food. It is faid to be fo nourishing and falutary, that the Baschkir Tartars, who towards the end of winter are much emaciated, no fooner return in fummer to the use of koumis, than they become ftrong and fat. The author of "A historical description of all the nations which compose the Russian empire," fays, speaking of Koumis, Elle oft fort nourisfante, et peut tenir lieu de tout autre aliment. Les Baschkirs s'en trouvent très bien, elle les rend bienportans et gais ; elle leur donne de l'embonpoint, et de bonnes couleurs. From the Tar-

medicinally. It is made with fermented mares-milk, according to the following recipe communicated by Dr Grieve in the Edin. Phil. Trans. * as he obtained it. vol is from a Russian nobleman, who went into that part of p. 181. Tartary where it is made, for the fake of using it me-

dicinally. " Take of fresh mare's milk, of one day, any quantity; add to it a fixth part of water, and pour the mixture into a wooden veffel; use then, as a ferment, an eighth part of the fourest cow's milk that can be got; but at any future preparation, a finall portion of old koumifs will better answer the purpose of fouring; cover the veffel with a thick cloth, and fet it in a place of moderate warmth; leave it at rest 24 hours, at the end of which time the milk will have become four, and a thick fubstance will be gathered on the top; then with a flick made at the lower end in the manner of a churn-staff, beat it till the thick fubstance above mentioned be blended intimately with the subjacent fluid. In this situation, leave it again at reft for 24 hours more; after which pour it into a higher and narrower veffel, refembling a churn, where the agitation must be repeated as before, till the liquor appear to be perfectly homogeneous; and in this state it is called koumifs, of which the tafte ought to be a pleafant mixture of fweet and four. Agitation must be employed every time before it be used."-To this detail of the process the nobleman subjoined, that in order to obtain milk in fufficient quantity, the Tartars have a cultom of separating the foal from the mare during the day, and allowing it to fuck during the night : and when the milk is to be taken from the mare, which is generally about five times a day, they always produce the foal, on the supposition that she yields her milk more copiously when it is present.

To the above method of making koumifs, our author has added fome particulars taken from other communications with which he was favoured by Tartars themselves. According to the account of a Tartar who lived to the fouth-east of Orenbourg, the proportion of milk and fouring ought to be the same as above; only, to prevent changing the veffel, the milk may be put at once into a pretty high and narrow veffel; and in order to accelerate the fermentation, fome warm milk may be added to it, and, if necessary, more fouring .- From a Tartar whom the Doctor met with at the fair of Macarieff upon the Volga, and from whom he purchased one of the leathern bags (A) which are used by the Kalmucks for the preparation and carriage of their koumis, he learned that the process may be much shortened by heating the milk before the fouring be added to it, and as foon as the parts begin to feparate, and a thick substance to rise to the top, by agitating it every hour or oftener. In this way he made fome in the Doctor's presence in the space of 12 hours. Our author learned also, that it was common among some

far-

⁽A) This bag was made of a horse's hide undressed, and by having been smoked had acquired a great degree of hardness. Its shape was conical, but was at the same time somewhat triangular, from being composed of three different pieces, fet in a circular base of the same hide. The sutures, which were made with tendons, were fecured by a covering on the outfide, with a doubling of the fame skin, very closely secured. It had a dirty appearance, and a very difagreeable fmell. On being asked the reason of this, he said, "The remains of the old koumils were left, in order to supply a ferment to the new milk."

Ko mifs. Tartars to prepare it in one day during fummer, and that the third; that the milk with all its parts in their nature. Krakes, with only two or three agitations; but that in winter, when, from a deficiency of mares milk, they are obliged to add a great proportion of that of cows, more agitation and more time are necessary. And though it is commonly used within a few days after the preparation, yet when well fecured in close veffels, and kept in a cold place, that it may be preserved for three months, or even more, without any injury to its qualities. He was told farther, that the acid fermentation might be produced by four milk as above, by a four paste of rye-flour, by the rennet of a lamb's stomach, or, what is more common, by a portion of old koumifs; and that in some places they saved much time, by adding the new milk to a quantity of that already fermented; on being mixed with which, it very foon undergoes the vinous change.

It was according to the process first mentioned, however, that all the koumis which the Doctor employed in medicine was prepared .- It has been found ferviceable in hectics and in nervous complaints; and our author relates fome very firiking cafes which the use of it had completely cured. All those who drank it, our author informs us, agreed in faving, that during its use, they had little appetite for food; that they drank it in very large quantities, not only without difguft, but with pleafure; that it rendered their veins turgid, without producing languor; that, on the contrary, they foon acquired from it an uncommon degree of fprightliness and vivacity; that even in cases of some excess it was not followed by indigestion, headach, or any of the fymptoms which usually attend the

abuse of other fermented liquors.

The utility, however, of this preparation as a medicine, supposing it completely ascertained, would among us, as our author observes, be greatly circumferibed by the fearcity of mares milk in this country. " Hence (fays he) inquiries will naturally be made, whether other species of milk admit of a fimilar vinous fermentation, and what proportion of spirit they contain. As these have never been the object, however, of my attention, I will here give the substance of what I have been able to learn from others respecting that which is the most common, the milk of cows.

" Dr Pallas, in the work above quoted, fays, that cows milk is also susceptible of the vinous fermentation, and that the Tartars prepare a wine from it in winter, when mares milk fails them; that the wine prepared from cows milk, they call airen; but that they always prefer koumis when it can be got, as it is more agreeable, and contains a greater quantity of spirit; that koumifs on distillation yields of a weak spirit one third, but that airen yields only two ninth parts of its whole quantity, which spirit they call arika.

"This account is confirmed by Oferetskowsky, a Ruffian, who accompanied Lepechin and other academicians, in their travels through Siberia and Tartary, He published lately a differtation on the ardent spirit

to be obtained from cows milk.

" From his experiments it appears, that cows milk may be fermented with, or even without, fouring, prowided fufficient time and agitation be employed; that no spirit could be produced from any one of its constituent parts taken separately, nor from any two of them,

ral proportion was the most productive of it; that the closer it was kept, or, which is the fame thing, the more difficultly the fixed air is allowed to escape during the fermentation (care being taken, however, that we do not endanger the burfting of the veffel), the more spirit is obtained. He also informs us, that it had a fourer fmell before than after agitation; that the quantity of spirit was increased, by allowing the fermented liquor to repose for some time before distillation; that from fix pints of milk, fermented in a close veffel, and thus fet to repose, he obtained three ounces of ardent fpirit, of which one was confumed in burning; but that from the same quantity of the same milk fermented in an open veffel, he could fcarcely obtain an ounce."

KRAKEN, in zoology, a most amazing large sea animal, faid to be feemingly of a crab-like form; the credit of whose existence rests upon the evidence produced by bishop Pontoppidan, in his Natural history of

As a full grown kraken has never been feen in all its parts and dimensions, an accurate survey of which must employ fome time, and not a little motion, it is impossible to give a complete description of one. Neverthelefs, we shall submit the probability of its existence on the best information our author could collect, which feems to have fixed his own belief of it; though at the fame time he acknowledges the account is very defective, and supposes a farther information concerning the creature may be referved for posterity.

Our fishermen, fays the author, unanimously and invariably affirm, that when they are feveral miles from the land, particularly in the hot fummer days, and by their diffance, and the bearings of some points of land, expect from eighty to a hundred fathoms depth, and do not find but from twenty to thirty; and more efpecially if they find a more than usual plenty of cod and ling, they judge that the kraken is at the bottom : but if they find by their lines that the water in the same place still shallows on them, they know he is rising to the furface, and row off with the greatest expedition till they come into the usual foundings of the place : when lying on their oars, in a few minutes the monter emerges, and shows himself sufficiently, though his whole body does not appear. Its back or upper part, which feems an English mile and a half in circumference (fome have affirmed more), looks at first like a number of small islands, surrounded with something that floats like fea-weeds; at last feveral bright points of horns appear, which grow thicker the higher they emerge, and fometimes stand up as high and large as the masts of middle-fized vessels. In a short time it flowly finks, which is thought as dangerous as its rifing ; as it causes such a swell and whirlpool as draws every thing down with it, like that of Malestrom. The bishop justly regrets the omission of probably the only opportunity that ever has or may be prefented, of furveying it alive, or feeing it entire when dead. This, he informs us, once did occur, on the credit of the reverend Mr Friis, minister at Nordland, and vicar of the college for promoting Christian knowledge; who informed him that in 1680, a kraken (perhaps a young and careless one, as they generally keep feveral leagues unless inasmuch as they were mixed with some part of from land) came into the waters that run between the rocks

Nº 173.

Kraken, rocks and cliffs near Alflahoug; where, in turning about, fome of its long horns caught hold of fome adjoining trees, which it might eafily have [torn up, but that it was also entangled in some clifts of the rocks, whence it could not extricate itself, but putrefied on the fpot. Our author has heard of no person destroyed by this monster, but relates a report of the danger of two fishermen who came upon a part of the water full of the creature's thick flimy excrements (which he voids for fome months, as he feeds for fome other); they immediately strove to row off, but were not quick enough in turning to fave the boat from one of the kraken's horns, which fo crushed the head of it that it was with difficulty they faved their lives on the wreck, though the weather was perfectly calm; the monster never appearing at other times. His excrement is faid to be attractive of other fish on which he feeds; which expedient was probably necessary, on account of his flow unwieldy motion to his subsidence; as this flow motion again may be necessary to the fecurity of ships of the greatest force and burden, which must be overwhelmed on encountering fuch an immense animal, if his velocity was equal to his weight; the Norwegians fuppofing, that if his arms, on which he moves, and with which he takes his food, were to lay hold of the largest man of war, they would pull it down to the bottom.

In confirmation of the reality of this animal, our Jearned author cites Debes's description of Faroe, for the existence of certain islands which suddenly appear and as fuddenly vanish. Many seafaring people, he adds, give accounts of fuch, particularly in the north fea; which their fuperstition has either attributed to the delufion of the devil, or confidered as inhabited by evil fpirits. But our honest historian, who is not for wronging the devil himself, supposes such mistaken iflands to be nothing but the kraken, called by some the foe trolden, or fea mischief; in which opinion he was greatly confirmed by the following quotation of Dr Hierne, a learned Swede, from baron Grippenhielm; and which is certainly a very remarkable paffage, viz. " Among the rocks about Stockholm, there is fometimes feen a tract of land, which at other times difappears, and is feen again in another place. Buræus has placed it as an island in his map. The peafants, who call it gummars ore, fay, that it is not always feen, and that it lies out in the open fea, but I could never find it. One Sunday, when I was out amongst the rocks founding the coaft, it happened, that in one place I faw fomething like three points of land in the fea, which furprifed me a little, and I thought I had inadvertently passed them over before. Upon this l called to a pealant, to enquire for gummars ore; but when he came, we could fee nothing of it : upon which the peafant faid all was well, and that this prognosticated a storm or a great quantity of fish." 'To which our author subjoins, " who cannot discover that this gummars ore, with its points and prognoftications of fish, was the kiaken, miltaken by Buræus for an island, who may keep himfelf about that fpot where he rifes?" He takes the kraken, doubtless, from his numerous tentaculi, which ferve him as feet, to be of the po-Lype kind; and the contemplation of its enormous bulk " led him to adapt a passage from Ecclesiasticus, xliii 31, 32. to it. Whether by it may be intended the dragon that is in the fea, mentioned Isaiah xxvii. 1. we refer VOL. IX. Part II.

to the conjecture of the reader. After paying but a Kraken, just respect to the moral character, the reverend function, and diligent investigations of our author, we must

admit the possibility of its existence, as it implies no contradiction; though it feems to encounter a general prepoffession of the whale's being the largest animal on or in our globe; and the eradication of any long prepoffession is attended with fomething irkfome to us. But were we to suppose a falmon or a sturgeon the largest fish any number of persons had seen or heard of, and the whale had discovered himself as seldom, and but in part, as the kraken, it is eafy to conceive that the existence of the whale had been as indigestible to fuch persons then as that of the kraken may be to others now. Some may incline to think fuch an extenfive monfter would encroach on the symmetry of nature, and be over proportionate to the fize of the globe itielf; as a little retrospection will inform us, that the breadth of what is feen of him, supposing him nearly round, must be full 2600 feet (if more oval, or crab-like, full 2000), and his thickness, which may rather be called altitude, at least three hundred; our author declaring he has chofen the least circumference mentioned of this animal for the greater certainty. These inimense dimensions, nevertheless, we apprehend will not argue conclusively against the existence of the animal, though confiderably against a numerous increase or propagation of it. In fact, the great scarcity of the kraken, his confinement to the north fea, and perhaps to equal latitudes in the fouth; the fmall number propagated by the whale, who is viviparous; and by the largest land animals, of whom the elephant is faid to go mar two years with young; all induce us to conclude from analogy, that this creature is not numerous; which coincides with a passage in a manufcript afcribed to Svere king of Norway, as it is cited by Ol. Wormius, in his Mufeum, p. 280, in Latin, which we shall exactly translate. "There remains one kind, which they call hasguse, whose magnitude is unknown, as it is feldom feen. Those who affirm they have feen its body, declare, it is more like an island than a beaft, and that its careafe was never found; whence fome imagine there are but two of the kind in nature." Whether the vanishing island Lemair, of which Captain Rodney went in fearch, was a kraken, we fubmit to the fancy of our readers. In fine, if the existence of the creature is admitted, it will feem a fair inference, that he is the fearcest as well as largest in our world; and that if there are larger in the universe, they probably inhabit some sphere or planet more extended than our own. Such we have no pretence to limit; and that fiction can devife a much greater than this is evident, from the cock of Mahomet, and the whale in the Bava Bathra of the Talmud, which were intended to be credited; and to either of which our kraken is a very shrimp in dimensions.

KRANTZIUS (Albertus), a native of Hamburgh, and a famous historian, who travelled over feveral parts of Europe, and was made rector of the university of Rostoch in 1482. He went from thence to Hamburgh in 1508, where he was elected dean of the chapter in the cathedral He did many good fervices to that church and city; and was fo famed for his abilities and prudence, that John king of Denmark and Frederic duke of Holstein did not scruple to make him

wrote feveral good historical works; the most confiderable of which is an Ecclefiaftical Hiftory of Saxony, inticled Metropolis, in folio; the best edition is that of Francfort. He died in 1517.

KRAUT, or CROUT. See CROUT.

KUBESHA. See LESGUIS.

KUHNIUS (Joachim), a learned German critic, was born at Gripfwalde in Pomerania, in 1647. He was in 1660 made principal of the college at Octingen in Suabia : in 1676, he was elected Greek professor in the principal college at Strasburg; and after acquitting himfelf with honour for ten years in this capacity, was made Greek and Hebrew professor in the same university. His uncommon skill in the Greek language drew a great number of scholars about him from very diffant places; and he published some classic authors with very learned notes both explanatory and critical He died in 1697.

KUNCKEL (John), a celebrated Saxon chemist, born in the duchy of Slefwick, in 1630. He became chemift to the elector of Saxony, the elector of Brandenburgh, and Charles II king of Sweden, who gave him the title of counfellor in metals, and letters of nobility, with the furname of Louwensteing. He employed 50 years in chemistry; in which, by the help of the furnace of a glass-house which he had under his care, he made feveral excellent discoveries, particularly of the phosphorus of urine. He died in Sweden in 1702; and left feveral works, fome in German, and others in Latin: among which, that intitled Observationes Chemica, and the " Art of making Glass," printed at Paris in 1752, are the most

efteemed

KURIL or KURILSKI ISLES, extending from N. Lat. 51. to 45. which probably once lengthened the peninfula of Kamtchatka before they were covulfed from it, are a feries of islands running fouth from the low promontory Lopatka, between which and Shoomska the most northerly is only the distance of one league. On the lofty Paramoufer, the fecond in the chain, is a highpeaked mountain probably volcanic; and on the fourth, called Argumakutan, is another volcano. On Urufs there is another; on Storgu there are two; and on Kunatir, or Kaunachir, there is one. Thefe three make part of the group which pass under the name of the land of Jefo. Japan abounds with volcanoes; fo that there is a feries of spiracles from Kamtchatka to Japan, the last great link of this extensive chain. - The Russians soon annexed these islands to their conquests. The sea abounded with otters, and the land with bears and foxes; and fome of the ifles sheltered the sable : temptations sufficient for the Russians to invade these islands; . but the rage after the furs of the fea otters has been fo great, that they are become extremely scarce both here and in Kamtchatka.

KUSTER (Ludolf), a very learned writer in the 88th century, was born at Blomberg in Westphalia, When very young, he was upon the recommendation of baron Spanheim appointed tutor to the two fons in womens habit.

umpire in a dispute they had with the Ditmarsi. He of the count de Schwerin, prime minister of the king Kufter. of Prussia, who, upon our author's quitting that sta- Kyphotion, procured him a pension of 400 livres. He was nilm. promifed a professorship in the university of Joachim; and till this should be vacant, being then but 25, he resolved to travel. He read lectures at Utrecht; went to England; and from thence to France, where he collated Suidas with three MSS, in the king's library, which furnished him with a great many fragments that had never been published. He was honoured with the degree of doctor by the university of Cambridge, which made him feveral advantageous offers to continue there: but he was called to Berlin, where he was installed in the professorship promised him, Afterward he went to Antwerp; and being brought over to the Catholic religion, he abjured that of the Protestants. The king of France rewarded him with a pension, and ordered him to be admitted supernumerary affociate of the academy of infcriptions. But he did not enjoy this new fettlement long; for he died in 1716, aged 46. He was a great mafter of the Latin tongue, and wrote well in it; but his chief excellence was his skill in the Greek language, to which he almost entirely devoted himself. He wrote many works; the principal of which are, I. Historia critica Homeri. 2. Jamblious de vita Pythagora. 3. An excellent edition of Suidas, in Greek and Latin, three volumes, folio. 4. An edition of Aristophanes, in Greek and Latin, folio. 5. A new Greek edition of the New Testament, with Dr Mills's Variations,

KYPHONISM, KYPHONISMUS, or Cyphonifmus, an ancient punishment which was frequently undergone by the martyrs in the primitive times; wherein the body of the person to suffer was anointed with honey, and fo exposed to the fun, that the flies and wasps might be tempted to torment him. This was performed in three manners: fometimes they only tied the patient to a ftake; fometimes they hoifted him up into the air, and fuspended him in a basket; and fometimes they firetched him out on the ground with his hands tied behind him. The word is originally Greek, and comes from xupor, which fignifies either the fake to which the patient was tied, the collar fitted to his neck, or an instrument wherewith they tormented him: the scholiast on Aristophanes says, it was a wooden lock or cage; and that it was called fo from xuither, " to crook or bend," because it kept the tortured in a crooked, bowing posture; others take the xupan for a log of wood laid over the criminal's head, to prevent his standing upright: Hefychius describes the xupur as a piece of wood whereon criminals were ftretched and tormented. In effect, it is probable the word might fignify all thefe feveral things. It was a generical name, whereof these were the species.

Suidas gives us the fragment of an old law, which punished those who treated the laws with contempt with kyphonism for the space of twenty days; after which they were to be precipitated from a rock, dreffed

A femi-vowel, or liquid, making the eleventh 1) letter of the alphabet.

It was derived from the old Hebrew Lamed, or Greek Lambda A. It is founded by intercepting the breath between the top of the tongue and forepart of the palate, with the mouth open; and makes a fweet found, with fomething of an aspiration; and therefore the b to it, in the beginning of words, as in llan, or lban, "a temple," founding nearly like fl, &c. In English words of one fyllable it is doubled at the end, as tell, bell, knell, &c. but in words of more fyllables than one it is fingle at the end, as evil, general, constitutional, &c. It is placed after most of the confonants in the beginning of words and fyllables, as black, glare, ad-le, ea-gle, &c. but before none. Its found is clear in Abel, but ob-

As a numeral letter, L denotes 50; and with a dash over it, thus, E, 5000. Used as an abbreviature, L stands for Lucius; and L. L. S. for a sesterce.

LA, the fyllable by which Guido denotes the laft found of each hexachord; if it begins in C, it answers to our A; if in G, to E; and if in F, to D.

LABADIE (John), a famous French enthusiast, fon of John Charles Labadie, governor of Bourges and gentleman in ordinary of the bed-chamber to the French king, was born in 1610. He entered young into the Jesuits college at Bourdeaux; which, by his own account, he afterwards quitted, but by other accounts was expelled for his peculiar notions, and for hypocrify. He became a popular preacher; but being repeatedly detected in working upon female devotees with spiritual instructions for carnal purposes, his loss of character among the Catholics drove him among the Protestants. A reformed jesuit being thought a great acquifition, he was precipitately accepted as a paftor at Montauban, where he officiated for eight years; but, attempting the chaftity of a young lady whom he could not convert to his purpose, and quarrelling with the Catholic priest about the right of interring a dead body, he was at length banished that place. The flory of his affair with the lady, as related by Mr Balye, may here be given as a specimen of his ministry. Having directed this damfel to the spiritual life, which he made to consist in internal recollection and mental prayer, he gave her out a certain point of meditation; and having strongly recommended it to her to apply herfelf entirely for fome hours to fuch an important object, he went up to her when he believed her to be at the height of her recollection, and put his hand into her breaft. She gave him a hafty repulse, expressed a great deal of surprise at the proceeding, and was even preparing to rebuke him, when he, without being in the least disconcerted, and with a devout air, prevented her thus: " I fee plainly, my child, that you are at a great distance from perfection; acknowledge your weakness with an humble spirit; ask forgiveness of God for your having given fo little attention to the mysteries upon which you ought to have meditated. Had you bestowed all

necessary attention upon these things, you would not Labadies, have been fenfible of what was doing about your breaft. But you are so much attached to fense, so little coacentered with the Godhead, that you were not a moment in discovering that I had touched you. I wanted to try whether your fervency in prayer had raifed you above the material world, and united you with the Sovereign Being, the living fource of immortality and of a spiritual state; and I see, to my great grief, that you have made very small progress, and that you only creep on the ground. May this, my child, make you ashamed, and for the future move you to perform the duties of mental prayer better than you have hitherto done." The young lady, who had as much good fense as virtue, was no less provoked at these words than at the bold actions of her ghoftly instructor; and could never afterwards bear the name of fuch an holy father. Labadie being driven out of Montauban, went to feek an afylum at Orange: but not finding himfelf fo fase there as he imagined, he withdrew privately to Geneva, where he imposed on the people by his devout preaching and carriage; and from thence was invited to Middleburg, where his fpirituality made him and his followers confidered as fo many faints, diftinguished by the name of Labadists. They increafed so much, that he excited the attention of the other churches, whose authority he disputed, till he was formally deposed by the fynod of Dort. Instead of obeying, he procured a tumultuous support from a crowd of his devotees; and at length formed a little fettlement between Utrecht and Amsterdam, where he erected a printing-prefs, which fent forth many of his works. Here he was betrayed by fome deferters, who exposed his private life, and informed the public

where he died in 1674. LABADISTS, a feet of religionists in the 17th century, followers of the opinions of John Labadie, of whom an account is given in the preceding article. Some of their opinions were, 1. That God could, and did deceive men. 2. That, in reading the Scriptures, greater attention should be paid to the internal inspiration of the Holy Spirit than to the words of the text 3. That baptifm ought to be deferred till mature age. 4. That the good and the wicked entered equally into the old alliance, provided they defcended from Abraham; but that the new admitted only spiritual men. 5. That the observation of Sunday was a matter of indifference. 6. That Christ would come and reign 1000 years on earth. 7. That the eucharist was only a commemoration of the death of Chrift; and that, though the fymbols were nothing in themfelves, yet that Christ was spiritually received by those who partook of them in a due manner. 8. That a contemplative life was a state of grace, and of divine union during this life, the fummit of perfection, &c. o. That the man whose heart was perfectly content and calm, half enjoys God, has familiar entertainments with him, and fees all things in him. 10. That this state was to be

of his familiarities with his female disciples, under pre-

tence of uniting them more particularly to God; and

was finally obliged to retire to Altena in Holftein,

Labdanum. tion of the fenfes and their objects, and by the exercise

of mental prayer.

LABARUM, the banner or flandard borne before the Roman emperors in the wars. The labarum confilled of a long lance, with a staff a-top; croffing it at right angles; from which hung a rich streamer, of a purple colour, adorned with precious stones. Till the time of Constantine it had an eagle painted on it; but that emperor, in lieu thereof, added a cross with a cipher expressing the name of Jesus.

This standard the Romans took from the Germans, Dacz, Sarmat & Pannonians, &c. whom they had overcome. The name labarum was not known before the time of Constantine; but the standard itself, in the form we have described it, abating the fymbols of Christianity, was used by all the preceding emperors. Some derive the word from labor, as if this finished their labours ; fome from wax 6110, " reverence, piety ;" others from Azufaviiv, " to take ;" and others from

λαφυρα, " fpoils."

LABAT (John Baptist), a celebrated traveller, of the order of St Dominic, was born at Paris, taught philosophy at Nancy, and in 1693 went to America in quality of a missionary. At his return to France in 1705, he was fent to the chapter of his order at Bologna to give an account of his million, and flaid feveral years in Italy. He died at Paris in 1738. His principal works are, I. A new voyage to the American islands, 6 vols 12mo. 2. Travels in Spain and Italy, 8 vols 12mo. 3. A new account of the western parts of Africa, 5 vols 12mo.: Father Labat was not in Africa, and therefore was not a witness of what he relates in that work. He also published the Chevalier des Marchais's voyage to Guinea, in 4 vols 12mo.; and An historical account of the western parts of Æthiopia, translated from the Italian of Father Cavazzi, 5 vols 12mo.

LABBE (Philip), born at Bourges in France, in 1607; professed philosophy, divinity, and the languages, with great applause; and died in 1667, aged 70. He was a laborious writer, and a good critic; and wrote, I. Nova Bibliotheca MS. librorum, in two volumes folio. 2. De Byzantinæ bistoriæ Scriptoribus. 3. Galeni vita. 4. Bibliotheca bibliothecarum. 5. Concordantia chronologica, &c. He began the last edition of "The councils," and died while the 9th volume was printing; they were finished in 17 volumes by

father Coffart.

LABDANUM, or LADANUM, in the materia medica, a refinous juice, which exfudes from a tree of the ciftus kind. It is faid to have been formerly collected from the beards of goats who broused the leaves of the ciftus: at present, a kind of rake, with several ftraps or thongs of fkins fixed to it, is drawn lightly over the shrub, fo as to take up the unctuous juice, which is afterwards fcraped off with knives. It is rarely met with pure, even in the places which produce it; the dust, blown upon the plant by the wind, mingling with the tenaceous juice: the inhabitants are also said to mix with it a certain black sand. In the shops two forts are met with. The best (which is very rate) is in dark-coloured almost black masses, of the confidence of a foft plaster, which grows still fofter upon being handled; of a very agreeable smell, and

Labarum come at by an entire felf abnegation, by the mortifica- of a light pungent bitterifh tafte. The other fort is Labdanume. harder, not fo dark coloured, in long rolls coiled up : Laborathis is of a much weaker fmell than the first, and has tory. a large admixture of a fine fand, which in the ladanum, examined by the French academy, made up

three-fourths of the mass.

In medicine it is used externally, to attenuate and discuss tumors; internally, it is more rarely used, but is greatly excelled by some against catarrhs and indyfenteries. Rectified spirit of wine almost entirely diffolves pure ladanum, leaving only a finall portion of gummy matter which has no talte or fmell : and hence this refin may be thus excellently purified for internal' purpofes. It is an ufeful ingredient in the stomachicplaster, which is now indeed styled the emplastrum ladani. LABEL, a long, thin, brafs rule, with a small fight at one end, and a centre-hole at the other; commonly used with a tangent-line on the edge of a cir-

cumferentor, to take altitudes. &c. LABEL, in law, is a narrow flip of paper, or parchment, affixed to a deed or writing, in order to hold the appending feal .- Any paper annexed by way of addition or explication, to any will or testament, is

also called a label or codicil:

LABEL, in heraldry, a fillet usually placed in the middle along the chief of the coat, without touching its extremities. Its breadth ought to be a ninth part of the chief. It is adorned with pendants; and when there are above three of these, the number must be fpecified in blazoning.

It is used on the arms of eldest sons while the father is alive, to diffinguish them from the younger : and is effeemed the most honourable of all differences.

See HERALDRY, p. 445. col. 1.

LABIAL LETTERS, those pronounced chiefly by means of the lips.

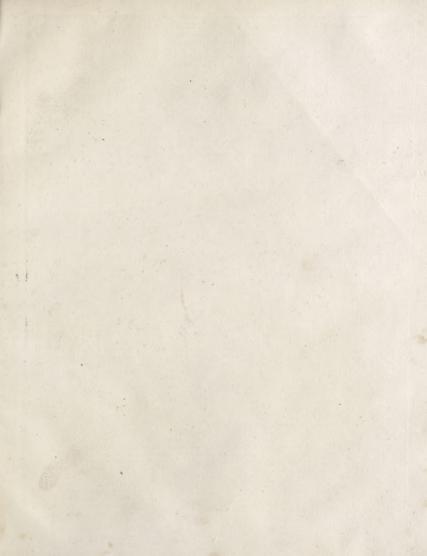

LABIATED FLOWERS, monopetalous flowers, confifting of a narrow tube with a wide mouth, di-

vided into two or more fegments.

LABIAU, a small town of Ducal Prussia, in a circle of the same name, feated at the mouth of the river Deime, with a strong castle, two sides of which are furrounded with water, and the other defended by a wall and ditch. E. Long. 19. 56. N. Lat. 55. 17. LABORATORY, or ELABORATORY, the chemits

work house, or the place where they perform their operations, where the furnaces are built, their veffels kept, &c. and in general the term laboratory is applied to any place where physical experiments in pharmacy, chemistry, pyrotechny, &c. are performed.

As laboratories must be of very different kinds, according to the nature of the operations to be performed in them, it is impossible that any directions can be given which will answer for every one. Where the purpofes are merely experimental, a fingle furnace or two of the portable kind will be fufficient. It is fcarce needful to add, that shelves are necessary for holding veffels with the products of the different operations : and that it is absolutely necessary to avoid confusion and diforder, as by these means the products of the operations might be loft or mistaken for one another. Mortars, filters, levigating stones, &c. must also be procured: but from a knowledge of the methods of performing the different chemical operations will eafily be derived the knowledge of a proper place to perform

them in ; for which fee the articles CHEMISTRY, ME-

TALLURGY, and FURNACE.

LABORATORY, in military affairs, figuifies that place where all forts of fire-works are prepared, both for actual fervice and for pleafure, viz. quick matches, fuzes, port-fires, grape-fhot, cafe-fhot, carcaffes, handgremades, cartridges, shells filled, and fuzes fixed, wads,

LABOUR, in general, denotes a close application to work or business.—Among seamen a ship is said to be in labour when she rolls and tumbles very much, either abour, under fail, or at anchor.—It is also spoken

of a woman in travail or child birth; fee Midwiffery.

LABOURER, generally fignifies one that does the
most flavish and less artful part of a laborious work, as

that of hufbandry, mafonry, &c.

LABOUREUR (John le), almoner to the king of France, and prior of Juvigne, was born at Montmorency near Paris in 1623. At the age of 18, he diftinguished himself by publishing "A collection of the monuments of illustinous perfons buried in the charch of the Celestines at Paris, with their elogies, genealogies, arms, and mottoca", 4to. He afterwards published an excellent edition of The Memoirs of Michael de Calelnau, with several other genealogical hiories; and died in 1675.—He had a brotter, Louis le Labureur, bailist of Montmorency, author of several pieces of poetry; and an uncle, Dom. Claude le Ladoureur, provoit of the abbey of L'isle Barbe, of which abbey he wrote a history, and published notes and corrections upon the breviary of Lyons, with some other things.

LABRADOR, the fame with New BRITAIN, or the country round Hadson's Bay. See these articles. LABRADORE STONE, a curious species of felt-

LABRADORE STONE, a curious species of feltspar, which exhibits all the colours of a peacock's tail.

See the article FELT. Spar.

LABRUM, in antiquity, a great tub which flood at the entrance of the temples, containing water for the priefls to wash themselves in previous to their facrifices. It was also the name of a bathing tub used

in the baths of the ancients.

LABRUS, in ichthyology, a genus of fishes be-longing to the order of thoracici. The characters are as follow: The covers of the gills fealy; the branchioftegous rays unequal in number; teeth conic, long, and blunt at their ends; one tuberculated bone in the bottom of the throat; two above, opposite to the other; one dorfal fin reaching the whole length of the back.; a flender skin extending beyond each ray, with a rounded tail: There are 41 species of this genus, which vary from each other, even those of the same fpecies, almost infinitely in colour; some of them being of a dirty red mixed with a certain duskiness; others most beautifully striped, especially about the head, with the richest colours, fuch as blue, red, and yellow. Care must therefore, be taken not to multiply the species from these accidental teiuts, but to attend to the form, which never varies. Mr Pennant mentions his having feen a species of labrus taken about the Giant's Caufeway in Ireland, of a most beautiful vivid green, fpotted with scarlet; and others at Bandooran in the county of Sligo of a pale green. To this genus belongs the fish called by the English the old-wife

LABURNUM, in botany. See CYTISUS.

LABYRINTH, among the ancients, was a large Labyriath intricate edifice cut out into various ailles and meanders running into each other, so as to render it difficult to get out of it.

There is mention made of feveral of those edifices among the ancients; but the most celebrated are the

Egyptian and the Cretan labyrinths.

That of Egypt, according to Pliny, was the oldelt of all the known labyrinths, and was fubfilling in his time after having itood 3000 years. He fays it was built by king Petefucus, or Tithoes; but Herodotus makes it the work of feveral kings: it food on the banks of the lake Mœris, and conflitted of 12 large contiguous palaces, containing 30 oc bambers, 1500 of which were under ground.—Strabo, Diodorus Siculus, Pliny, and Mels, fpeak of this moument with the fame admiration as Herodotus: but not one of them tells us that it was confuncted to bewilder those who, attempted to go over it; though it is manifelt that, without a guide, they would be in danger of lofing their way.

Ît was this danger, no doubt, which introduced a new term into the Greek language. The word labyrinth, taken in the literal fenle, fignities a circumferibed fpace, interfected by a number of paffages, fome of which crofs each other in every direction like thofe in quarries and mines, and others make larger or fmaller circuits round the place from which they depart like the fpiral lines we fee on certain fhells. In the figurative fenle, it was applied to obfeure and captious queltions, to indirect and ambiguous answers, and to those discussions which, after long digressions, bring us back to the point from which we fet out.

The Cretan labyrinth is the most famed in history or fable; having been rendered particularly remarkable by the flory of the Minotaur, and of Theseus who found his way through all its windings by means of Ariadne's clue. On Plate CCLLX, its exhibited a supposed plan of it, copied after a draught given by Meurilus *, taken from an ancient flore.—But what In Cret, was the real nature of this labyrinth, merits a more lib. It capa-

particular inquiry.

Diodorus Sieulus relates as a conjecture, and Pliny as a certain fact, that Dzdalus conftruêted this labyrinth on the model of that of Egypt, though on a leis feale. They add, that it was formed by the command of Minos, who kept the Minotaur flut up in it; and that in their time it no longer exifted, having been either deftroyed by time, or purpofely demolified. Diodorus Siculus and Pliny, therefore, confidered this labyrinth as a large edifice; while other writers reprefent it fimply as a cavern hollowed in the rock, and full of winding paffages. The two former authors, and the writers laft mentioned, have tranfinited to us two different traditions; it remains for us to choofe that which is most probable.

If the labyrinth of Crete had been confiructed by Dædalus under Minos, whence is it that we find no mention of it, neither in Homer, who more than once speaks of that prince and of Crete; nor in Herodotus, who describes that of Egypt, after having said that the menuments of the Egyptians are much superior to those of the Greeks; nor in the more ancient geographers; nor in any of the writers of the ages when

Greece flourished ?

of ignorance, whenever it turned its eyes on the early ages. All great labours, all works which required more strength than ingenuity, were attributed to Hercules: and all those which had a relation to the arts. and required a certain degree of intelligence in the ex-

The opinion of Diodorus and Pliny Supposes, that in their time no traces of the labyrinth existed in Crete, and that even the date of its destruction had been forgotten. Yet it is faid to have been vifited by the disciples of Apollonius of Tyana, who was cotem-porary with those two authors. The Cretans, therefore, then believed that they possessed the labyrinth.

" I would request the reader (continues the Abbe Fravels of Barthelemi +, from whom these observations are ex-Anacharfis, tracted) to attend to the following passage in Strabo. Vi. 441. At Napulia, near the ancient Argos, (fays that judicious writer), are still to be feen vast caverns, in which are confiructed labyrinths that are believed to be the work of the Cyclops; the meaning of which is, that the labours of men had opened in the rock paffages which croffed and returned upon themselves, as is done in quarries. Such, if I am not mistaken, is

the idea we ought to form of the labyrinth of Crete. "Were there feveral labyrinths in that island? Ancient authors speak only of one, which the greater part place at Cnoffus; and fome, though the number

le but small, at Gortyna.

"Belon and Tournefort have given us the description of a cavern fituated at the foot of mount Ida, on the fouth fide of the mountain, at a small distance from Gortyna. This was only a quarry according to the former, and the ancient labyrinth according to the latter: whose opinion I have followed, and abridged his account. Those who have added critical notes to his work, befides this labvrinth, admit a fecond at Cnoffus, and adduce as the principal support of this opinion the coins of that city, which represent the plan of it, according as the artifts conceived it. For on fome of these it appears of a square form, on others round: on fome it is only sketched out; on others it has, in the middle of it, the head of the Minotaur. In the Memoirs of the Academy of Belles Lettres, I have given an engraving of one which appears to me to be of about the 5th century before Christ: and on which we fee on one fide the figure of the Minotaur, and on the other a rude plan of the labyrinth. It is therefore certain, that at that time the Cnossians believed they were in possession of that celebrated cavern; and it also appears that the Gortynians did not pretend to contest their claim, fince they have never given the figure of it on their money.

"The place where I suppose the labyrinth of Crete to have been fituated, according to Tournefort, is but one league distant from Gortyna; and, according to Strabo, it was diftant from Cnoffus fix or feven leagues. All we can conclude from this is, that the territory of the latter city extended to very near the former.

"What was the use of the caverns to which the name of labyrinth was given? I imagine that they were first excavated in part by nature; that in some places stones were extracted from them for building ed and gilded in various tastes, to decorate the arms of

Labyrinth. This work was attributed to Dædalus, whose name cities; and that, in more ancient times, they served Labyring is alone sufficient to discredit a tradition. In fact, his for a habitation or asylum to the inhabitants of a diname, like that of Hercules, had become the refource first exposed to frequent incursions. In the journey of Anacharfis through Phocis, I have fpoken of two great caverns of Parnaffus, in which the neighbouring people took refuge; in the one at the time of the deluge of Deucalion, and in the other at the juvation of Xerxes. I here add, that, according to Diodorus Siculus, the most ancient Cretans dwelt in the caves of Mount Ida. The people, when inquiries were made on the spot, faid that their labyrinth was originally only a prison. It may have been put to this use: but it is difficult to believe that, to prevent the escape of a few unhappy wretches, fuch immense labours would have been undertaken."

LABYRINTH of the Ear. See ANATOMY, p. 764. LAC, MILK, among physicians. See MILK.

LAC, Gum. See LACCA. .

LACARRY (Giles), a learned Jesuit of the 17th century, was born in the diocese of Castres, in Languedoc, in 1605. He taught philosophy, theology, and the holy Scriptures in his fociety; was rector of the college of Cahors; and became well skilled in hiftory. He wrote many works; the principal of which are, 1. Hift. Galliarum fub Prafectis Pratorii Galliarum, Ato. a work which is much effeemed, and extends from the reign of Constantine to that of Justinian. 2. Historia Romana a Julio Cesare ad Constan-tinum Magnum, per numismata & marmora antiqua, an excellent work. 3. Epitome bifloria Reg. Francia, ex Dionysio Petavio excerpta, also much esteemed. 4. An edition of Velleius Paterculus, with learned notes.

LACCA, LAC, or Gum-Lac is a kind of wax, of

which a species of insects form cells upon trees, like honeycombs. See the article Coccus, spec. 5. In these cells remain some of the dead insects, which give a red colour to the whole substance of the lac. That called flick-lac is the wax adhering to some of the small branches of the tree, and which is unprepared. This lac, when separated from the adhering flicks, and grossly powdered, and deprived of its colour by digeftion with menstruums, for the fake of the dyes and other purpofes, is called feed-lac; when the flick-lac is freed from impurities by melting it over a gentle fire, and formed into cakes, it is called lump-lac; and laftly, that called shell-lac is the cells liquified, strained, and formed into thin transparent laminæ in the following manner. Separate the cells from the branches, break Kerr's Acc. them into fmall pieces, throw them into a tub of water count of the for one day, wash off the red water and dry the cells, Gum and with them fill a cylindrical tube of cotton cloth two in Phil. feet long, and one or two inches in diameter; tie both France, vol. ends, turn the bag above a charcoal fire; as the lac &c. liquifies twift the bag, and when a fufficient quantity

has transuded the pores of the cloth, lay it upon a fmooth junk of the plantain-tree (Musa Paradifiaca, Linnei), and with a strip of the plantain leaf draw it into a thin lamella; take it off while flexible, for in a minute it will be hard and brittle. The value of shell-lac is according to its transparency.

The lac infect is one of the most useful of that tribe yet discovered, particularly to the natives of the countries where it is found. They confume a great quantity of shell-lac in making ornamental rings, paint-

linked chains for necklaces, and other female ornaments. - The following are recipes for various purpofes

to which this substance is applied by them.

1. For fealing wax. Take a flick, and heat one end of it upon a charcoal fire; put upon it a few leaves of the shell-lac softened above the fire; keep alternately heating and adding more shell-lac until you have got a mass of three or four pounds of liquified shelllac upon the end of your ttick (in which manner lump lac is formed from feed lac). Knead this upon a wetted board with three ounces of levigated cinnabar: form it into cylindrical pieces; and to give them a polish, rub them while hot with a cotton cloth.

2. For japanning. Take a lump of fliell-lac, prepared in the manner of fealing-wax, with whatever colour you please, fix it upon the end of a stick, heat the polified wood over a charcoal fire, and rub it over with the half-melted lac, and polish by rubbing it even with a piece of folded plantain leaf held in the hand; heating the laquer and adding more lac as occasion requires. Their figures are formed by lac, charged with

various colours in the fame manner.

3. For Varnish. In ornamenting their images and religious houses, &c. they make use of very thin beat lead, which they cover with various varuishes, made of lac charged with colours. The preparation of them is kept a fecret. The leaf of lead is laid upon a smooth iron heated by fire below while they spread the varnish

4. For Grindstones. Take of river fund three parts, of feed lac washed one part, mix them over the fire in a pot, and form the mass into the shape of a grindstone, having a square hole in the centre, fix it on an axis with liquified lac, heat the stone moderately, and by turning the axis it may eafily be formed into an exact orbicular shape. Polishing grindstones are made only of such fand as will pass easily through sine muslin, in the proportion of two parts fand to one of lac. This fand is found at Ragimaul. It is composed of fmall angular crystalline particles tinged red with iron, two parts to one of black magnetic fand. The stonecutters, inflead of fand, use the powder of a very hard granite called corune. These grindstones cut very fast. When they want to increase their power, they throw fand upon them, or let them occasionally touch the edge of a vitrified brick. The fame composition is

5. For Painting. Take one gallon of the red liquid from the first washing for shell-lac, strain it thro' a cloth, and let it boil for a fhort time, then add half an ounce of foap earth (fosfil alkali); boil an hour more, and add three ounces of powdered load (bark of a tree); boil a short time. let it stand all night, and ftrain next day. Evaporate three quarts of milk without cream to two quarts upon a flow fire, curdle it with four milk, and let it stand for a day or two; then mix it with the red liquid above mentioned; frain them through a cloth, add to the mixture one ounce mons: mix the whole and throw it into a cloth-bag ftrainer. The blood of the infect forms a coagulum with the caseous part of the milk, and remains in the which do not require its colour. bag, while a limpid acid water drains from it. The

Lacca the ladies; and it is formed into beads, spiral and coagulum is dried in the shade, and is used as a red Lacca.

6. For Dyeing. Take one gallon of the red liquid prepared as before without milk, to which add three ounces of alum. Boil three or four ounces of tamarinds in a gallon of water, and firain the liquor. Mix equal parts of the red liquid and tamarind water over a brifk fire. In this mixture dip and wring the filk alternately until it has received a proper quantity of the dye. To increase the colour, increase the proportion of the red liquid, and let the filk boil a few minutes in the mixture. To make the filk hold the colour, they boil a handful of the bark called load in water, strain the decoction, and add cold water to it : dip the dried filk into this liquor feveral times, and then dry it. Cotton cloths are dyed in this manner ; but the dve is not fo lasting as in filk.

The lac colour is preferved by the natives uponflakes of cotton dipped repeatedly into a strong folution of the lac infect in water, and then dried.

Among us lac is also used in various arts; being employed in the preparation of spirit-varnishes, for the making of fealing-wax, and as a colouring material: for dying fearlet; fee VARNISH, WAX, &c. It is unfoluble in water; and difficultly foluble in spirit of wine, which for that purpose must be well dephlegmated. According to Neumann, 16 ounces of feed-lac, diftilled in an open fire, yielded nine ounces and fix drams of a butter or thick oil, one ounce fix drams of a watery liquor neither acid nor alkaline, and a refidumm weighing two ounces and a half. The colour given by lac is less beautiful, but more durable, than that given by cochineal. To render the colouring matter of the lac diffusible in water, fo as to be anplied to the stuffs to be dyed, Mr Hellot directs the following process: Let some powdered gum-lac be digested during two hours in a decoction of comfry root, by which a fine crimfon colour is given to the water, and the gum is rendered pale or ftraw-coloured. To this tincture, poured off clear, let a folution of alum be added; and when the colouring matter has fubfided, let it be separated from the clear liquor and dried. It will weigh about the of the quantity of lac employed. This dried fecula is to be diffolyed or diffused in warm water, and some solution of tin is to be added to it, by which it acquires a vivid fearlet colour. This liquor is to be added to a folution formed upon flicks, for cutting flones, shells, &c. by of tartar in boiling water; and thus the dve is prepa-

The method of obtaining the fine red lac used by painters from this fubilance, is by the following simple process. Boil the stick-lac in water, filtre the decoction, and evaporate the clear liquor to a dryness over a gentle fire. The occasion of this casy separation is, that the beautiful red colour here separated, adheres only flightly to the outfides of the flicks broke off the trees along with the gum-lac, and readily communicates itself to boiling water. Some of this flicking matter also adhering to the gum itself, it is proper to boil the whole together; for the gum does not. and an half of alum, and the juice of eight or ten le- at all prejudice the colour, nor dissolve in boiling water: fo that after this operation the gum is as fit for making fealing wax as before, and for all other uses

Lac is likewife employed for medicinal purpofee.

The flick-lac is the fort used. It is of great esteem cases proper. The golden covering may be in some parts Lace, in Germany, and other countries, for laxity and sponbutic habit : for this use the lac is boiled in water, with the addition of a little alum, which promotes its folution; or a tincture is made from it with rectified fpirit. This tincture is recommended also internally in the fluor albus, and in rheumatic and fcorbutic diforders: it has a grateful fmell, and not unpleafant, bitterifh, aftringent tafte.

The gum-lac has been lately used as an electric, inflead of glass, for electrical machines. See LACQUER,

LAKE, and VARNISH.

Artificial LACCA, or Lacque, is also a name given to a coloured fubflance drawn from feveral flowers; as the yellow from the flower of the juniper, the red from the poppy, and the blue from the iris or violet. The tinctures of these slowers are extracted by digesting them feveral times in aqua-vitæ, or by boiling them over a stove fire in a lixivium of pot-ashes and alum.

An artificial lacca is also made of Brasil wood, boiled in a lixivium of the branches of the vine, adding a little cochineal, turmeric, calcined alum, and arfenic, incorporated with the bones of the cuttle-fish pulvevized and made up into little cakes and dried. If it be to be very red, they add the juice of lemon to it : to make it brown, they add oil of tartar. Dove coloured or columbine lacca is made with Brafil of Fernambuc, steeped in distilled vinegar for the space of a month, and mixed with alum incorporated in cuttle-fish bone. For other processes, see Colour-Making.

LACE, in commerce, a work composed of many threads of gold, filver, or filk, interwoven the one with the other, and worked upon a pillow with spindles according to the pattern defigned. The open work is formed with pins, which are placed and displaced as the spindles are moved. The importation of gold and filver

lace is prohibited.

Method of Cleaning Gold-LACE and Embroidery when tarnifhed .- For this purpose alkaline liquors are by no means to be used; for while they clean the gold, they corrode the filk, and change or discharge its colour. Soap also alters the shade, and even the species of certain colours. But spirit of wine may be used without any danger of its injuring either the colour or quality of the subject; and in many cases proves as effectual, for restoring the lustre of the gold, as the corrosive detergents. A rich brocade, flowered with a variety of colours, after being difagreeably tarnished, had the luftre of the gold perfectly reftored by washing it with a foft brush dipt in warm spirit of wine; and some of the colours of the filk, which were likewife foiled, became at the fame time remarkably bright and lively. Spirit of wine feems to be the only material adapted to this intention, and probably the boafted fecret of certain artifts is no other than this spirit disguised. Among liquids, Dr Lewis favs, he does not know of any other that is of fufficient activity to discharge the foul matter, without being hurtful to the filk : as to powders, however fine, and however cautiously used, they fcratch and wear the gold, which here is only fuperfieial and of extreme tenuity.

But tho' fpirit of wine is the most innocent material that can be employed for this purpose, it is not in all city, the former of the country, which afterwards Nº 173.

worn off; or the base metal, with which it had been giness of the gums proceeding from cold or a fcor- iniquitously alloyed, may be corroded by the air, fo as to leave the particles of the gold difunited; while the filver underneath, tarnified to a yellow hue, may continue a tolerable colour to the whole; in which cases it is apparent, that the removal of the tarnish would be prejudicial to the colour, and make the lace or embroidery less like gold than it was before. A piece of old tarnished gold-lace, cleaned by spirit of wine, was deprived, with its tarnish, of the greatest part of its golden hue, and looked now almost like filver-lace.

Method of Separating the Gold and Silver from I.ACR without burning it. Cut the lace in pieces, and (having separated the thread from it by which it was fewed to the garment) tie it up in a linen cloth, and boil it in foap ley, diluted with water, till you perceive it is diminished in bulk; which will take up but a little time, unless the quantity of lace be very confiderable. Then take out the cloth, and wash it several times in cold water, fqueezing it pretty hard with your foot, or beating it with a mallet, to clear it of the foap-ley; then untie the cloth, and you will have the metallic part of the lace pure, and nowhere altered in colour or diminished in weight.

This method is abundantly more convenient and less troublesome than the common way of burning; and as a fmall quantity of the ley will be sufficient, the expence will be trifling, especially as the same ley may be used feveral times, if cleared of the filky calcination. It may be done in either an iron or copper veffel.

The ley may be had at the foap-boilers, or it may be made of pearl ash and quick-lime boiled together

in a sufficient quantity of water.

The reason of this sudden change in the lace will be evident to those who are acquainted with chemistry: for filk, on which all our laces are wove, is an animal fubstance, and all animal fubstances are foluble in alkalies, especially when rendered more caustic by the addition of quicklime; but the linen you tie it in, being a vegetable, will remain unaltered.

Blond-LACE, a lace made of fine linen thread or filk, much in the fame manner as that of gold and filver. The pattern of the lace is fixed upon a large round pillow, and pins being fluck into the holes or openings in the patterns, the threads are interwoven by means of a number of bobbins made of bone or ivory, each of which contains a small quantity of fine thread, in fuch a manner as to make the lace exactly refemble the pattern. There are feveral towns in England, and particularly in Buckinghamshire, that carry on this manufacture; but vast quantities of the finest lace have been imported from Flanders.

LACEDÆMON (fab. hift.), a fon of Jupiter and Tayget the daughter of Atlas, who married Sparta the daughter of Europa, by whom he had Amyclas and Eurydice the wife of Acrifius. He was the first who introduced the worship of the Graces in Laconia, and who first built them a temple. From Lacedæmon and his wife, the capital of Laconia was called Lacedamon

and Sparta.

LACEDÆMON, a noble city of Peloponnefus, called also Sparta; these names differing in this, that the latter is the proper and ancient name of the Lacerta.

Lacedæ- came to be applied to the city (Strabo, Stephanus.) Homer alfo makes this distinction; who calls the country boly, because encompassed with mountains. It has alfo been feverally known by the name of Lelegia, from the Leleges the first inhabitants of the country, or from Lelex one of their kings; and Oebalia, from Oebalas the fixth king from Eurotas. It was also called Hecatompolis, from 100 cities which the whole province once contained. This city was the capital of Laconia, fituated on the right or well fide of the Eurotas : it was lefs in compafs than, however equal, or even fuperior, to Athens in power. Polybius makes it 48 stadia, a circuit much inferior to that of Athens. Lelex is supposed to have been the first king of Lacedæmon. His descendants, 13 in number, reigned fuccessively after him, till the reign of the fons of Orestes, when the Heraclidæ recovered the Peloponnefus about 80 years after the Trojan war. Procles and Eurysthenes, the defcendants of the Heraclidæ, usurped the crown together; and after them it was decreed that the two families should always sit on the throne together. The monarchial power was abolished, and the race of the Heraclidæ extinguished at Sparta about 219 years before Christ. Lacedæmon in its flourishing state remained without walls, the bravery of its citizens being instead of them (Nepos). At length in Cassander's time, or after, when the city was in the hands of tyrants, distrusting the defence by arms and bravery, a wall was built round it, at first flight, and in a tumultuary, or hasty manner; which the tyrant Nabis made very strong (Livy, Juftin). Paulanias ascribes the first walls to the times of Demetrius and Pyrrhus, under Nabis. The walls of the city were pulled down 188 years before Christ by Philopæmen, who was then at the head of the Achæan league, and Laconia fome time after became a Roman province when reduced by Mummias. See SPARTA. -The present city is called Missira, situated in E. Long. 23. O. N. Lat. 36. 55.

LACERNA, a coarse thick garment worn by the Romans over their gowns like a cloak, to keep off the rain and cold. It was first used in the camp, but afterwards admitted into the city. The emperors were the lacerna of a purple dye. The lacerna was at first very fhort, but was lengthened after it became fashionable, which was not till the civil wars and the triumvirate; before this time it was confined to the foldiers. Senators were forbidden wearing it in the city by Valentinian and Theodofius. Martial makes mention of lacernæ worth 10,000 festerces. Some confound this garment with the penula; but it feems rather to have

refembled the chlamys and birrus.

LACERTA, the LIZARD, in zoology, a genus of CCLX. & amphibious animals, belonging to the order of reptilia, the characters of which are thefe: The body is naked, with four feet, and a tail. There are 49 species: the most remarkable are,

1. The crocodylus, or crocodile, has a compressed jagged tail, five toes on the fore and four on the hind-feet This is the largest animal of the lizard

kind. One that was diffected at Siam, an account of which was fent to the Royal Academy at Paris, was 18 feet and a half long, of which the tail was no less than five feet and a half, and the head and neck above two and a half. He was four feet and nine inches in circumference where thickeft.

The hinder legs, including the thigh and the paw, Vol. IX. Part II.

were two feet and two inches long; the paws, from Lacerta. the joint to the extremity of the longest claws, were above nine inches. They were divided into four toes ; of which three were armed with large claws, the longest of which was an inch and a half, and feven lines and a half broad at the 100t. The fourth toe was without a nail, and of a conical figure; but was covered with a thick skin like shagreen leather. These toes were united with membranes like those of ducks, but much thicker.

The fore-legs had the fame parts and conformation as the arms of a man, both within and without; but they were fomewhat shorter than those behind. The hands had five fingers, the two last of which had no nails, and were of a conical figure, like the fourth toe on the hind paws. The head was long, and had a little rifing at the top; but the rest was flat, and especially towards the extremity of the jaws. It was covered with a skin, which adhered firmly to the skull and to the jaws. The skull was rough and unequal in several places; and about the middle of the forehead there were two bony crefts, about two inches high. They were not quite parallel, but feparated from each other in proportion as they mounted upwards.

The eye was very small in proportion to the rest of the body; and was fo placed within its orbit, that the outward part, when thut, was only a little above an inch in length, and run parallel to the opening of the

The nose was placed in the middle of the upper jaw. near an inch from its extremity, and was perfectly round and flat, being two inches in diameter, of a black, foft, fpongy fubstance, not unlike the nose of a dog. The noftills were in the form of a Greek capital 5; and there were two caruncles which filled and closed them very exactly, and which opened as often as he breathed through the nofe. The jaws feemed to thut one within another by means of feveral apophyfes, which proceeded from above downwards, and from below upwards, there being cavities in the opposite jaw to receive them. They had 27 dog-teeth in the upper jaw and 15 in the lower, with feveral void spaces between them. They were thick at the bottom, and fharp at the point; being all of different fizes, except ten large hooked ones, fix of which were in the lower jaw, and four in the upper. The mouth was 15 inches in length, and eight and a half in breadth where broadest; and the distance of the two jaws, when opened as wide as they could be, was 15 inches and a half. The skull, between the two crests, was proof against a musket-ball, for it only rendered the part a little white that it fruck against.

The colour of the body was of a dark brown on the upper part, and of a whitish citron below, with large fpots of both colours on the fides. From the shoulders to the extremity of the tail he was covered with large scales of a square form, disposed like parallel girdles, and were 52 in number; but those near the tail were not fo thick as the rest. In the middle of each girdle there were four protuberances, which became higher as they approached the end of the tail, and composed four rows; of which the two in the middle were lower than the remaining two, forming three channels, which grew deeper the nearer they came to the tail, and were confounded with each other about two feet from its extremity.

The skin was defended with a fort of armour 3 R

Lacerta. which, however, was not proof against a musket-ball, them for trunks of trees covered with a rough and dry Lacerta. colour, and were made up of feales of divers shapes. They were about one fixth of an inch in thickness, and were not fo hard as those on the back.

This creature is, however, faid to grow to a still larger fize than that above mentioned, fome having been known to measure 25 feet in length .- They have no tongue; but in place of that organ there is a fort of membrane attached by its edges to the two

fides of the under jaw.

The crocodile lavs eggs, which the covers over with fand, and leaves to be hatched by the hear of the fun. They are to be met with in the rivers Nile, Niger, and Ganges, besides most other large rivers in the fouthern

parts of Afia, Africa, and America.

Mr Haffelquitt informs us, that the crocodile fwallows stones to assist digestion, after the manner of feedcating birds, which commit to the flomach the work of madication as well as concoction, being deftitute of the inftruments adapted to that purpose. The Egyptians fare, that his excrements do not pass by the anus: this feems to be confirmed by the ftructure of the gut, which is near the pylorus; for it cannot eafily be conceived that excrements should pass through such a narrow paffage, feemingly destined for the conveyance of the chyle only; but the structure of the parts, and the gut being fo near the pylorus, feem to indicate that the excrements pass through it into the ventricle, and are vomited up. The inhabitants above Cairo fay they fee this daily; and observe, that the crocodile is obliged to come on shore as often as he has occasion to ease himself. There is a folliculus, of the bigness of a hazel nut, under the shoulders of the old crocodiles, which contains a thick matter fmelling like musk. The Egyptians are very anxious to get this when they kill a crocodile, it being a perfume much esteemed by the grandees. When the male copulates with the female, he turns her with his fnout on her back. The Egyptians use the fat against the rheumatism and stiffness of the tendons, esteeming it a powerful remedy outwardly applied. They fay the gall is good for the eyes; they make use of it as a certain remedy for barrennefs in women, taking about fix grains internally, and outwardly they apply a peffus made of cotton and the gall of a crocodile. The eyes of the crocodile are the best aphrodifiacs of any known by the Arabs; who prefer them to all confections, dea-fatyrii, hyacinthi, &c. and even to ambergris.

The crocodile is a very dangerous and terrible animal in fome countries. It does a great deal of mifchief among the common people of Upper Egypt, often killing and devouring women who come to the river to fetch water, and children playing on the shore or fwimming in the river. In the ftomach of one diffected before Mr Barton the English conful, they found the bones of the legs and arms of a woman, hours, and even days, ftretched in the fun and mo-

contrary to what has been commonly faid. How- bark; but the miftake would foon be fatal; for the ever, it must be acknowledged, that the attitude in feemingly torpid animal, at the near approach of any which it was placed might contribute not a little there- living creature, inftantly darts upon it, and carries it to; for probably, if the ball had firuck obliquely a- to the bottom. In the times of an inundation they gainst the shell, it would have flown off. Those parts fometimes enter the cottages of the natives, where they of the girdles underneath the belly were of a whitish feize the first animal they meet with. There have been feveral examples of their taking a man out of a cance in the fight of his companions, without their being able to lend him any affiftance. The crocodile, however, except when pressed with hunger, or with a view of depositing its eggs, feldom leaves the water. Its usual method is to float along upon the surface, and feize whatever animals come within its reach; but when this method fails, it then goes closer to the bank. There it waits in patient expectation of fome land animal that comes to drink; the dog, the bull, the tiger, or man himself. Nothing is to be seen as the animal approaches, nor is its retreat discovered till it is too late for fafety. It feizes the victim with a foring, and goes at a bound much fafter than fuch an unwieldy animal could be supposed to do; then having fecured the creature both with teeth and claws, it drags it into the water, inflantly finks with it to the bottom, and in this manner quickly drowns it. Sometimes it happens, that the creature wounded by the crocodile makes its escape; in which case, the latter purfues with great celerity, and often takes it a fecond time. In these depredations, however, this terrible animal often feizes on another as formidable as itself. and meets with a desperate resistance. We are told of frequent combats between the crocodile and the tiger. All creatures of the tiger kind are continually oppressed by a parching thirst, that keeps them in the vicinity of great rivers, whither they descend to drink very frequently. On these occasions they are feized by the crocodile; upon whom they inftantly turn with the greatest agility, and force their claws into his eyes, while he plunges with his fierce antagonist into the river. There they continue to struggle for fome time, till at last the tiger is drowned. Notwithflanding all this, however, we are affured by Labat, that a negro, with no other weapon than a knife in his right hand, and his left arm wrapped round with a cow-hide, ventures boldly to attack this animal in its own element. As foon as he approaches the crocodile, he prefents his left arm, which the animal fwallows most greedily: but as it sticks in his throat, the negro has time to give it feveral flabs below the chin, where it is eafily vulnerable; and the water also getting in at the mouth, which is held involuntarily open, the creature is foon bloated up as big as a tun, and expires.

The natives of Siam feem particularly fond of the capture of all the great animals with which their country abounds. The crocodiles are taken by throwing three or four strong nets across a river, at proper diflances from each other; fo that if the animal breaks through the first, it may be caught by one of the rest. When it is first taken, it employs the tail, which is the grand instrument of strength, with great force; but after many unfuccefsful ftruggles, the animal's ftrength with the rings which they wear in Egypt as ornaments. is at last exhausted. Then the natives approach their Thele animals are feen in some places lying for whole prisoner in boats, and pierce him in the most tender parts till he is weakened by loss of blood. When he tionles; fo that one not used to them might mistake has done stirring, they begin by tying up his mouth, Lacerta, and with the same cord tie his head to his tail, which last they bend back like a bow. However, they are

not yet perfectly secure from his sury; but for their greater fafety they tie his fore feet, as well as those behind, to the top of his back. These precautions are not useless; for if they were to omit them, the crocodile would foon recover strength enough to do a great deal of mischief. When thus brought into subjecti n, or when taken young and tamed, this formidable animal is used to divert and entertain the great men of the eaft. It is often managed like an horfe; a curb is put into its mouth, and the rider directs it as he thinks! proper. Though aukwardly formed, it does not fail crocodile is feen to propagate in numbers that would to preced with fome degree of fwiftness; and is thought to move as fast as some of the most unwieldy of our own animals, the hog or the cow. Some indeed affert, that no animal could escape it but for its flowness in turning; which, however, feems very improbable, as its back bone is full of articulations, and

feemingly as flexible as that of other large animals. All crocodiles breed near fresh waters; and though they are fometimes found in the fea, yet that may be confidered rather as a place of excursion than abode. They produce their young by eggs, as was faid above; and for this purpose, the female, when she comes to lav. chooses a place by the fide of a river, or some freshwater lake, to deposit her brood in. She always pitches upon an extensive fandy shore, where she may dig a hole without danger of detection from the ground being fresh turned up. The shore must also be gentle and fhelving to the water, for the greater convenience of the animal's going and returning; and a convenient place must be found near the edge of the stream, that the young may have a shorter way to go. When all these requisites are adjusted, the animal is seen cautiously flealing up on shore to deposit her burden. The prefence of a man; a beaft, or even a bird, is sufficient to deter her at that time; and if the perceives any creature looking on, the infallibly returns. If, however, nothing appears, the then goes to work, fcratching up the fand with her fore-paws, and making a hole pretty deep in the shore. There she deposits from 80 to 100 eggs, of the fize of a tennis-ball, and of the fame figure, covered with a tough white skin like parchment. She takes above an hour to perform this talk; and then covering up the place fo artfully that it can feareely be perceived, the goes back to return again the next day. Upon her return with the fame precaution as before, the lays about the fame number of eggs; and the day following also a like number. Thus having deposited her whole quantity, and having covered them close up in the fand, they are foon vivified by the heat of the fun; and at the end of 30 days the young ones begin to break open the shell. At this time the female is inflinctively taught that her young ones want relief; and she goes upon land to feratch away the fand and fet them free. Her brood quickly avail themselves of their liberty; a part run unguided to the water; another part afcend the back of the female, and are carried thither in greater fafety. But the moment they arrive at the water, all natural connection is at an end; when the female has introduced her young to their natural element, not only she, but the male, become amongst the number of their most formidable enemies, and devour as many of them as

at the bottom; by far the greatest number are de- Lacerta. ftroyed, and the reft find fafety in their agility or minu'enefs.

But it is not the parent alone that is thus found to thin their numbers; the eggs of this animal are not only a delicious feaft to the favage, but are eagerly fought after by every beaft and bird of prey. The ichneumon was erected into a deity among the ancients for its fuccess in destroying the eggs of these monfters: at present that species of the vulture called the gallinazo is their most prevailing enemy. All along the banks of great rivers, for thousands of miles, the foon over-run the earth, but for the vulture, that feems appointed by Providence to abridge its feeundity. Thefe birds are ever found in great numbers where the crocodile is most numerous; and hiding themselves within the thick branches of the trees that shade the banks of the river, they watch the female in filence. and permit her to lay all her eggs without interruption. Then when the has retired, they encourage each other with cries to the spoil; and flocking all together upon the hidden treasure, tear up the eggs, and devour them in a much shorter time than they were deposited, Nor are they less diligent in attending the female while the is carrying her young to the water; for if any one of them happens to drop by the way, it is fure to receive no mercy.

Such is the extraordinary account given us by late travellers of the propagation of this animal; an account adopted by Linnaus and the most learned naturabifts of the age. Yet if one might argue from the general analogy of nature, the crocodile's devouring her own woung when she gets to the water feems doubtful. This may be a ftory raifed from the general idea of this animal's rapacious cruelty; when in fact the crocodile only feems more cruel than other animals, because it has more power to do mischief. It is probable that it is not more diverted of parental tenderness than other creatures; and we are the more led to think fo, from the peculiar formation of one of the crocodile kind, called,

2. The open-bellied crocodile; which is furnished with a falfe belly like the opoffum, where the young creep out and in as their dangers or necessities require. The crocodile, thus furnished at least, cannot be faid to be an enemy to her own young, fince the thus gives them more than parental protection. It is probable also that this open bellied crocodile is viviparous, and fofters her young that are prematurely excluded in this fecond womb until they come to proper maturity.

This crocodile is a species that was not described by Linnieus; but has been inferted in the Syflema Nature fince his death, under the name of Lacerta gangelica. Mr Edwards tells us, that three of these creatures were sent from Bengal about the year 1747, to the late Dr Mend phylician in ordinary to the king. Two of them the Doctor preferved in his collection, and prefented the third to the late curious Mrs Kennon; and fince the decease of these worthy persons, they became the property of Mr James Lemon of London, who obliged our author with one of them to produce to the royal fociety. The narrowness of the beak is the most extraordinary they can. The whole brood featters into different parts circumstance in this crocodile, which appears like

Lacerta, the bill of the bird called goofeander. It has small sharp teeth. Another peculiarity is a paunch or open purie in the middle of the under fide of the belly, which feems to be naturally formed with round hips, and hollow within, to receive its young in time of danger, as it appears in the American animal called opoffum. Dr Parsons gave it as his opinion, that the opening in the belly was really natural, it having no appearance of being cut or torn open. In other refrects it hath all the marks common to alligators or crocodiles. The beak was finely creafed transverfely. The animal appeared in the fpirits all over of a yellowish olive colour, the under fide lighter than the upper, the latter having fome dusky marks and spots. This species inhabits the banks of the Ganges; and it is very ftrange that they should never have been defcribed before, as our India company have been fo long fettled there, and the animal is at full growth nearly, if not altogether, as large as the common crocodile.

How long the crocodile lives we are not certainly informed: if we may believe Aristotle, it lives the age of a man; but the ancients fo much amufed themselves in inventing fables concerning this animal, that even truth from them is fuspicious. What we know for certain from the ancients is, that among the various animals that were produced to fight in the amphitheatre at Rome, the combat of the crocodile was not wanting. Marcus Scaurus produced them living in his unrivalled exhibitions; and the Romans confidered him as the best citizen, because he furnished them with the

most expensive entertainments.

3. The alligator, or American crocodile, has a vaft mouth, furnished with sharp teeth; from the back to the end of the tail, ferrated; skin tough and brown, and covered on the fides with tubercles. This dreadful fpecies, which grows to the length of 17 or 18 feet, is found in the warmer parts of North America; and ther it basks on the sides of dry banks or old trees; most numerous as we approach the fouth, and the more fierce and ravenous. Yet in Carolina it never deyours the human species, but on the contrary shuns mankind; it will, however, kill dogs as they fwim the rivers, and hogs which feed in the fwamps. It is often feen floating like a log of wood on the furface of the water, and is miltaken for fuch by dogs and other animals, which it feizes and draws under water to devour at its leifure. Like the wolf, when preffed by long hunger, it will fwallow mud, and even stones and pieces of wood. They often get into the wears in purfuit of fish, and do much mischief by breaking them to pieces. They are torpid during the winter in Carolina; and retire into their dens, which they form by burrowing far under ground. It makes the entrance under water, and works unwards. In fpring it quifs its retreat, and reforts to the rivers, which it fwims up and down; and chiefly feeks its prey near the mouth, where the water is brackish .- It roars and makes a dreadful noise at its first leaving its den, and against bad weather. It lays a valt number of eggs in the fand, near the banks of lakes and rivers, and leaves them to be hatched by the fun : multitudes are destroyed as foon as hatched either by their own fpecies or by fish of prey. In South America the carran vulture is the inftrument of Providence to deftroy multitudes; by that means preventing the country from being rendered uninhabitable.

4. The Cayman, or Antilles crocodile, which has by Lacerta. different authors been confounded with the two preceding species, is evidently different from both ; and has accordingly been properly diffinguished by the Abbe Bonnarerre in the Encyclopidie Methodique t. tvovez Er-See our figure, where the differences are so apparent products, as to require no detail. —The greatest strength of this and is dianimal, according to M. Merian, confifts in its teeth Philipine of which there are two rows crofting one another, by Naturello, means of which it grinds with the greatest eafe what - p. 35. ever it feizes upon. But it must not be understood from this that there is a double row of teetly, as Seba pretends, on each fide of the under jaw; but only that there are two rows on each jaw, one in the right and the other on the left fide. - The Cayman is fo

they meet with .- Another figure is added, representing an egg with the young one at the time of breaking the shell. See the Plates. 5. The caudiverbera, has a depressed pinnatifid tail, and palmated feet. It is larger than the common

called from fome fmall ifles of that name among the

Antilles, where these creatures are faid to be very nu-

merous. They are of exceeding strength, and equally

the dread both of men and animals; for they live on

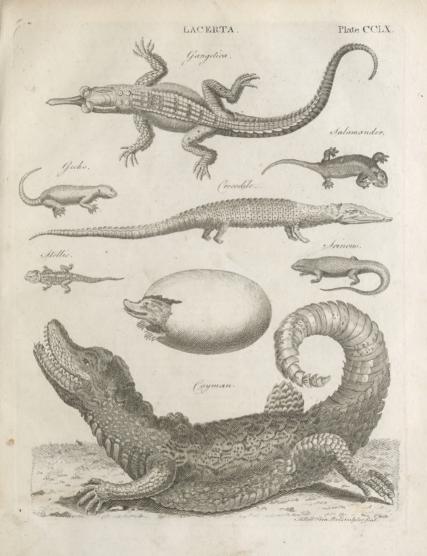

land as well as in the water, and devour every creature

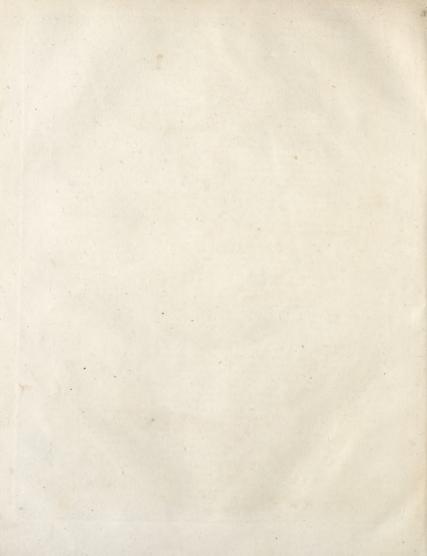

green lizard, is found in Peru, and has got its name from its beating the ground with its tail.

6. The stellio has a verticillated tail, and dentated fcales. It is a native of Africa, and the warm parts of Asia. It frequents the ruinous walls of Natolia, Syria, and Palestine. The Arabs call it bardun. The Turks kill it; for they imagine, that, by declining the head, it mimics them while they fay their prayers.

7. The agilis, has a pretty long verticillated tail, with fharp fcales, and a fcaly collar. This is the common green lizard, and is a native both of Europe and India. This species is extremely nimble: in hot weabut, on being observed, immediately retreats to its hole. The food of this species, as well as of all the other British lizards, is infects; and they themselves are devoured by birds of prey. They are all perfectly harmless; yet their form frikes one with difguit, and has occasioned great obscurity in their history. Mr Pennant mentions a lizard killed in Worcestershire in the year 1714, which was two feet fix inches long, and four inches in girth. The fore-legs were placed eight inches from the head; the hind-legs five inches beyond those: the legs were two inches long; the feet divided into four toes, each furnished with a sharp claw. Another of the fame kind was afterwards killed in that county; but whether thefe large lizards were natives of other countries and imported into England, or whether they were of British growth, is uncertain.

8. The chamæleon has a crooked cylindrical tail. The head of a large chamæleon is almost two inches long, and from thence to the beginning of the tail it is four inches and a half. The tail is five inches long, and the feet two and a half. The thickness of the body is different at different feafons; for fometimes from the back to the belly it is two inches, and fometimes but one; for he can blow himself up and contract himself at pleasure. This swelling and contraction is not only of the back and belly, but also of the legs and tail.

These different motions are not like those of other ture, and motion of the eyes, have something very Lacerta. animals, which proceed from a dilatation of the breaft in breathing, and which rifes and falls fuccessively; but they are very irregular, as in tortoifes and frogs. The chamæleon has continued as it were blown up for two hours together, and then he would grow lefs and less infentibly; for the dilatation was always more quick and visible than the contraction. In this last flate he appeared extremely lean, and the spine of the back was sharp, and all his ribs might be told: likewife the tendons of the arms and legs might be feen

The skin is very cold to the touch; and notwithflanding he feems fo lean, there is no feeling the beating of the heart. The furface of the fkin is unequal, and has a grain not unlike shagreen, but very foft, be cause each eminence is as smooth as if it was polished. Some of these are as large as a middling pin's head on the arms, legs, belly, and tail; but on the shoulders and head they are of an oval figure, and a little larger. Those under the throat are ranged in the form of a chaplet, from the lower lip to the breaft. Some on the head and back are amaffed together in clusters, with spaces between them, on which are almost imperceptible spots of a pale red and yellow colour, as well as the ground of the skin itself, which plainly appears between thefe clusters. This ground changes colour when the animal is dead, becoming of a grevish brown, and the small spots are whitish,

The colour of all those eminences, when the chamæleon is at rest in a shady place, is of a bluish grey, except on the claws, where it is white with a little yellow; and the spaces between the clusters is of a pale red and yellow, as was before observed. But when he is in the fun, all parts of the body which are affected with the light become of a greyish brown, or rather of a tawney. That part of the fkin which the fun does not shine on, changes into several brighter colours, which form fpots of the fize of half one's finger. Some of these descend from the spine half way on the back; and others appear on the fides, arms, and tail. They are all of an Isabella colour, from a mixture of a pale yellow and of a bright red, which is the colour of the ground of the fkin.

The head of a chamæleon is not unlike that of a fish, it being joined to the breast by a very short neck, covered on each fide with cartilaginous membranes refembling the gills of fifthes. There is a creft directly on the top of the head, and two others on each fide above the eyes, and between thefe there are two cavities near the top of the head. The muzzle is blunt, and not much unlike that of a frog : at the end there is a hole on each fide for the nostrils; but there are no ears, nor any fign of any.

The jaws are furnished with teeth, or rather with a bone in the form of teeth, which he makes little or no use of, because he lives upon swallowing flies and other infects without chewing them; and hence arofe the vulgar notion of his living upon air, because he was never feen to eat. The tongue, which Linnæus fays refembles an earthworm, is of confiderable length, and is enlarged and fomewhat flattened at the end. From this member there continually oozes out a very glutinous liquor, by means of which it catches fuch infects as come within its reach, and it is furprifing to fee with what quickness it retracts its tongue the instant it has arrested any prey. The form, ftrucparticular; for they are very large, being almost half " an inch in diameter. They are of a globous figure ; which may be eafily feen, because they fland out of the head. They have a fingle eye-lid like a can, with a fmall hole in the middle, through which the fight of the eve appears, no bigger than a pin's head, and of a shining brown, encircled by a little ring of a gold colour. This eye-lid has a grain like shagreen, as well as the other parts of the fkin; and when the reft of the body changes colour, and affumes foots of different shapes, those on the lid always keep the same form, though they are tinctured with the fame colour as the fkin. But the most extraordinary thing relating to the eyes is, that this animal often moves one when the other is entirely at reft; nay, fometimes one eve will feem to look directly forward and the other backward, and one will look up to the fky when the other regards the earth.

That part of the body which is called the trunk. and comprehends the thorax and the belly in a chamæleon, is almost all thorax, with little or no belly. The four feet are all of a length; and the only difference between them is, that those before are turned backwards, and those behind forwards. There are five toes on each paw, which have a greater refemblance to hands than feet. They are all divided into two, which gives the appearance of two hands to each arm, and two feet to each leg; and though one of these parts have three toes, and the other but two, yet they seem to be all of the same size. These toes lie together under the fame skin as in a mitten; however, their shape might be feen through the skin. With these paws the chamæleon can lay hold of the small branches of trees in the fame manner as a parrot. When he is about to perch, he parts his toes differently from birds, because he puts two behind and two before. The claws are little, crooked, very sharp, and of a pale yellow, proceeding but half way out of the fkin, while the other half is hid beneath it. His walk is flower than that of a tortoife, and he feems to move along with an affectation of gravity. He feems to feek for a proper place to fet his feet upon; and when he climbs up trees, he does not truft to his feet like fquirrels, but endeavours to find out clefts in the bark, that he may get a furer hold.

His tail is like that of a viper when it is puffed up and round; for otherwise the bones may be seen in the fame manner as on the back. He always wraps his tail round the branches of trees, and it ferves him as it were inflead of a fifth hand. He is a native of Africa and Afia. Mr Haffelquift is of opinion, that the change of colour in the chamæleon is owing to itsbeing exceedingly subject to the jaundice, which particularly happens either when it is exposed to the fun or when it is made augry. The mixture of the bile with its blood is then very perceptible, and, as the skin is transparent, makes it spotted with green and yellow. He never faw it coloured with red, blue, or purple; and does not believe that ever it affumes thefe colours.

9. The gecko, has a cylindrical tail, concave ears, and a warty body. It is the Indian falamander of Bontius. "This animal is very frequent in Cairo (fays Haffelquift), both in the houses and without them. The poifon of this animal is very fingular, as it exhales from the lobuli of the toes. The animal Lacerta. feeks all places and things impregnated with fea-falt, and, passing over them several times, leaves this very noxious poison behind it. In July 1750, I saw two women and a girl in Cairo at the point of death, from eating cheefe new falted, bought in the market, and on which this animal had dropt its poifon. Once at Cairo, I had an opportunity of obferving how acrid the exhalations of the toes of this animal are, as it ran over the hand of a man who endeavoured to catch it; there immediately rose little puffules over all those parts the animal had touched; thefe were red, inflamed, and fmarted a little, greatly refembling those occasioned by the flinging of nettles. It emits an odd found, especially in the night, from its throat, not unlike that of a frog."

10. The scincus has a cylindrical tail compressed at the point, and blunt marginated toes. This animal is found in Arabia Petræa near the Red Sea, and in Upper Egypt near the Nile. It is much used by the inhabitants of the east as an aphrodisiac, but not at this time by the Europeans. The flesh of the animal is given in powder, with fome flimulating vehicle; broth made of the recent flesh is likewise used by the Arabs. It is brought from Upper Egypt and Arabia to Alexandria, whence it is carried to Venice and Marfeilles, and from thence to all the apothecaries

fhops of Europe.

II. The nilotica has a long tail with a triangular edge, and four lines of scales on the back. It is met with in the moift places of Egypt near the Nile. The Egyptians fay that this lizard proceeds from the eggs of the crocodile laid in the fand, but that the crocodile proceeds from those laid in the water. Mr Haffelquist hath detected the fallacy of this account.

12. The paluftris has a lanceolated tail, and four toes on the fore-feet, and inhabits the stagnating waters of Europe. It has a flow and crawling pace. Mr Pennant mentions his having more than once found, under ftones and old logs, fome very minute lizards that had much the appearance of this kind: they were perfectly formed, and had not the least vestiges of fins; which circumstance, joined to their being found in a dry place remote from water, feems to indicate, that they had never been inhabitants of that element, as it is certain many of our lizards are in their first state. At that period they have a fin above and below their tail; that on the upper part extends along the back as far as the head; but both drop off as foon as the animal takes to the land, being then no longer of any use. Mr Ellis has remarked certain pennated fins at the gills of one very common in most of our stagnating waters, and which is frequently observed to take a bait like a

13. The falamandra, or falamander, has a short cylindrical tail, four toes on the fore-feet, and a naked porous body. This animal has been faid, even in the Philosophical Transactions, to live in the fire; but this is found to be a miltake. It is found in the fouthern countries of Europe. The following account of this species is extracted from the Count de la Cepede's Natural History of Serpents. Whilft the hardest bodies cannot refift the violence of fire, the world have endeavoured to make us believe that a fmall lizard can not only withstand the slames, but even extinguish them. As agreeable fables readi-

ly gain belief, every one has been eager to adopt Lacerta. that of a fmall animal fo highly privileged, fo fuperior to the most powerful agent in nature, and which could furnish so many objects of comparison to poetry, fo many pretty emblems to love, and fo many brilliant devices to valour. The ancients believed this property of the falamander, withing that its origin might be as furprifing as its power; and being defirous of realizing the ingenious fictions of the poets, they have pretended that it owes its existence to the pureft of elements, which cannot confume it; and they have called it the daughter of fire, giving it however a body of ice. The moderns have followed the ridiculous tales of the ancients; and as it is difficult to flop when one has passed the bounds of probability, some have gone fo far as to think that the most violent fire could be extinguished by the land salamander. Quacks fold this fmall lizard, affirming, that when thrown into the greatest conflagration, it would check its progress. It was very necessary that philosophers and naturalifts should take the trouble to prove by facts what reason alone might have demonstrated; and it was not till after the light of science was diffused abroad, that the world gave over believing in this wonderful property of the falamander. This lizard, which is found in fo many countries of the ancient world, and even in very high latitudes, has been however very little noticed, because it is seldom seen out of its hole, and because for a long time it has inspired much terror. Even Aristotle speaks of it as of an animal with which he was fcarcely acquainted.

One of the largest of this species, preserved in the French king's cabinet; is feven inches five lines in length, from the end of the muzzle to the root of the tail, which is three inches eight lines. The fkin does not appear to be covered with scales, but it is furnished with a number of excrescences like teats, containing a great many holes, feveral of which may be very plainly distinguished by the naked eye, and through which a kind of milk oozes, that generally spreads itfelf in fuch a manner as to form a transparent coat of varnish above the skin of this oviparous quadruped, na-

turally dry. The eyes of the falamander are placed in the upper part of the head, which is a little flatted; their orbit projects into the interior part of the palate, and is there almost surrounded by a row of very small teeth, like those in the jaw bones: these teeth establish a near relation between lizards and fifnes; many species of which have also several teeth placed in the bottom of the mouth. The colour of this lizard is very dark : upon the belly it has a bluish call, intermixed with pretty large irregular yellow spots, which extend over the whole body, and even to the fect and eyeslids; fome of these spots are besprinkled with small black fpecks; and those which are upon the back often touch without interruption, and form two long yellow bands. The colour must, however, be subject to vary; and it appears that fome falamanders are found in the marshy forests of Germany, which are quite black above and yellow below. To this variety we must refer the black salamander, found by Mr Laurenti in the Alps, which he confidered as a diffinct species.

The falamander has no ribs; neither have frogs, to which it has a great refemblance in the general form

fuddenly covers itself with that kind of coat of which mal is deprived of that sentiment necessary for its prewe have fooken, and it can also very rapidly change its fervation, it suddenly compresses its skin, as is said. fkin from a ftate of humidity to a ftate of drynels. when tormented, and spurts forth upon those who at-The milk which iffues from the small holes in its fur- tack it that corrosive milk which is under it. The cold falamander has been confidered as an fometimes retire in great numbers to hollow trees, animal endued with the miraculous power of refifting, hedges, and below old rotten flumps; and they pals and even of extinguishing, fire; but at the same time, the winter in places of high latitude, in a kind of bur- it has been debased as much as elevated by this singurows, where they are found collected, feveral of them lar property. It has been made the most fatal of ani-being joined and twisted together. The salamander mals: the ancients, and even Pliny, have devoted it being destitute of claws, having only four toes on each to a kind of anathema, by affirming that its poison is of the fore feet, and no advantage of conformation the most dangerous of all. They have written, that making up its deficiencies, its manner of living must, infecting with its poison almost all the vegetables of a as is indeed the case, be very different from that of large country, it might cause the destruction of subole other lizards. It walks very flowly; far from being nations. The moderns also for a long time believed the able to climb trees with rapidity, it often appears to falamander to be very poifonous; they have faid, that drag itfelf with great difficulty along the furface of the its bite is mortal, like that of the viper; they have earth. It feldom goes far from the place of shelter fought out and prescribed remedies for it; but they have which it has fixed on; it passes its life under the earth, at length had recourse to observations, by which they often at the bottom of old walls during fummer; it ought to have begun. The famous Bacon wished naturadreads the heat of the fun, which would dry it; and lifts would endeavour to afcertain the truthrespecting the it is commonly only when rain is about to fall that it poifon of the falamander. Gefner proved by expericomes forth from its fecret afylum, as if by a kind of ments that it did not bite, whatever means were used to necessity, to bathe itself, and to imbibe an element to irritate it; and Wurfbainus showed that it might safewhich it is analogous. Perhaps it finds then with ly be touched, and that one might without danger greatest facility those infects upon which it feeds. It drink the water of those wells which it inhabited. Salamanders have even been kept more than fix ner as upon all other animals. He remarked, that it months in the water of a well without giving them was fearcely upon the fire, when it appeared to be coany food; care only was taken to change the water vered with the drops of its milk, which rarified by the heat, iffued through all the pores of the fkin, but in It has been remarked, that every time a falaman- greater quantity from the head and dugs, and that it der is plunged into the water, it attempts to raife immediately became hard. It is needless to fay, that its noffrils above the furface as if to feek for air, which this milk is not fufficiently abundant to extinguish is a new proof of the need that all oviparous quadru- even the fmalleft fire. M. de Maupertuis, in the peds have to breathe during the time they are not course of his experiments, in vain irritated several in a state of torpor. The salamander has apparent- salamanders: none of them ever opened their mouths; ly no cars, and in this it refembles ferpents. It has he was obliged to open them by force. As the even been pretended that it does not hear, and on this teeth of this lizard are very fmall, it was very difaccount it has got the name of fourd in some provinces ficult to find an animal with a skin sufficiently fine of France. This is very probable, as it has never been to be penetrated by them; he tried without fucheard to utter any cry, and filence in general is coupled cefs to force them into the flesh of a chicken flripped of its feathers; he in vain pressed them against the Having then perhaps one fenfe lefs than other ani- ikin : they were displaced, but they could not enter. mals, and being deprived of the faculty of communi- He however made a falamander bite the thigh of a cating its fensations to those of the same species, even chicken, after he had taken off a small part of the skin. by imperfect founds, it must be reduced to a much in- He made salamanders newly caught bite also the tongue ferior degree of inftinct: it is therefore very stupid; and lips of a dog, as well as the tongue of a turkey; and not bold, as has been reported: it does not brave but none of these animals received the least injury. danger, as is pretended, but it does not perceive it. M. de Maupertuis afterwards made a dog and a turkey Whatever gestures one makes to frighten it, it always swallow salamanders whole, or cut into pieces; and yet

It was long believed that the falamander was of no fex ; and that each individual had the power of engendering its like, as feveral species of worms. This is not the most absurd fable which has been imagined with respect to the salamander; but if the manner in which they come into the world is not fo marvellous as has been written, it is remarkable in this, that it differs from that in which most other lizards are brought forth, as it is analogous to that in which the chalcide and the feps, as well as vipers and feveral kinds of ferpents, are produced. On this account the fala mander merits the attention of naturalits much more than on account of the false and brilliant reputation which it has so long enjoyed. M. de Maupertuis having opened fome falamanders, found eggs in them, and at the fame time fome young perfectly formed; the eggs were divided into two long bunches like grapes, and the young were enclosed in two transparent bags; they were equally well formed as the old ones, and much more active. The falamander, therefore, brings forth young from an egg hatched within its belly as the viper ; and her fecundity is very great: naturalists have long written that she has forty or fifty at one time; and M. de Maupertuis found 42 young ones in the body of a

lour, almost without spots; and this colour they preferve fometimes during their whole lives in certain countries, where they have been taken for a diffinct species, as we have faid. Mr Thunberg has given, in the Memoirs of the Academy of Sweden, the description of a lizard, which he calls the Japanese lizard, and which appears not to differ from our falamander but in the arrangement of its colours. This animal is almost black, with feveral whitish and irregular spots, both on the upper part of the body and below the paws; on the back there is a strip of dirty white, which becomes narrower to the point of the tail. This whitish stripe is interspersed with very small specks which form the distinguishing characteristic of our land falamander. We are of opinion, therefore, that we may confider this Japanese lizard, described by Mr Thunberg, as a variety of the species of our land salamander, modified a little, perhaps, by the climate of Japan. It is in the largest island of that empire, na med Niphon, that this variety is found. It inhabits the mountains there, and rocky places. The Japanese consider it as a powerful stimulant, and a very active remedy; and on this account, in the neighbourhood of Jedo, a number of these Japanese sala.

The young falamanders are generally of a black co-

female falamander, and 54 in another.

manders may be feen dried, hanging from the cieling of the shops. 14. The bafilifkus, has a long cylindrical tail, a radiated fin on the back, and a creft on the throat. It is a native of the Indies. It is a very harmless creature; and altogether destitute of those wonderful qualities Nº 173.

LAC Lacerta, neither of them appeared to be sensible of the least un- which have been attributed to the sabulous animal of Lacerta, the fame name. See the article BASLISK.

> 15. The fex-lineata, or lion-lizard, is about fix inclies long; the body of a grey colour, marked lengthwife on each fide with three whitish lines: the legs are long; and it has a very long tail, which it curls up, looking fierce at the fame time, whence probably it has received its English name. It inhabits South Carolina and the greater Antilles. It is very inoffenfive, and re-

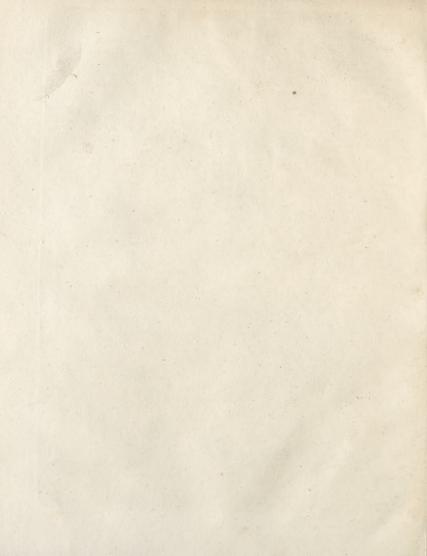

> markably agile; but is a prey to rapacious birds. 16. The green lizard of Carolina is fo denominated from its colour. This species is very slender; the tail is near double the length of the body, and the whole length about five inches. It inhabits Carolina; where it is domestic, familiar, and harmless. It sports on tables and windows, and amuses with its agility in catching flies. Cold affects the colours: in that uncertain climate, when there is a quick transition in the fame day from hot to cold, it changes instantly from the most brilliant green to a dull brown. They are a prey to cats and ravenous birds. They appear chiefly in fummer; and at the approach of cold weather they re ire to their winter recesses, and lie torpid in the hollows and crevices of rotten trees. It frequently happens that a few warm funshiny days so invigorate them, that they will come out of their holes and appear abroad; when on a fudden the weather changing to cold, fo enfeebles them, that they are unable to return to their retreats, and will die of cold.

> 17. The iguana, or guana, with the top of the back and tail strongly serrated, and the gullet serrated in the fame manner, is fometimes found to be five feet long. It has fmall teeth, and will bite hard. It inhabits the rocks of the Bahama islands, and lurks in cliffs or hollow trees. It feeds entirely on vegetables and fruits; and the fat of the abdomen affumes the colour of that which it has last eaten. It is slow of motion, and has a most difgusting look; yet it is esteemed a most delicate and wholesome food, noxious only to venereal patients, according to Linnæus. It is not amphibious, yet on necessity will continue long under water; it fwims by means of the tail, keeping its legs close to the body. Guanas are the support of the natives of the Bahama islands, who go in their floops from rock to rock in fearch of them. They are taken with dogs trained for the purpofe; and as foon as caught, their mouths are fewed up, to prevent them from biting. Some are carried alive for fale to Carolina; others falted and barrelled for home-con-

> 18. The bullaris, or green lizard of Jamaica, is about fix inches long, of a thining grafs-green colour. It is common in Jamaica, frequenting hedges and trees. When approached to, these animals, by filling their throat with wind, fwell it into a globular form with a fearlet colour; which, when contracted, the fearlet disappears, and the part returns to the colour of the rest of the body. The figure represents the animal with its throat thus inflated. This fwelling action feems to proceed from menacing, or deterring one from coming near them, though they are very inoffen-

> 19. The muricata, or prickly lizard, has a long rounded tail; its body, which is of a brownish grey colour, is covered with sharp-pointed scales, and the

Laches whole upper part marked with transverse dusky bars. forrow, imagining the manes of the deceased were Lacinium The scales are furnished with a prominent line on the Lachryma-upper furface, and toward the back part of the head almost run into a fort of weak spines.

20. The laticauda, or broad-tailed lizard, has a flattened lanceolate tail, fomewhat fpiny on the margin. It is about four inches and a half in length. The head is difproportionably large. The upper furface of the body is of a dusky grey colour, and befet with small tubercles, which in fome parts sharpen to a point.

The colour of the under furface of the body is pale,

or almost white. This and the preceding species are inhabitants of New South Wales.

There are above 60 other species of this genus; two of which, the feps and chalcides, being very different from the other fpecies, and approaching in form to the ferpent tribe, figures of them are added in the Plates. A fimilar species is the bipes, transferred to this genus, in the last edition of the Systema Naturæ, from the Anguis of former editions, where it was called the anguis

bipes. See Anguis.

LACHES, (from the French lascher, i. e. lazare, or lasche, ignavus), in the English law fignifies slackness or negligence, as it appears in Littleton, where laches of entry is a neglect of the heir to enter. And probably it may be an old English word: for where we fay there is laches of entry, it is all one as if it were faid there is a lack of entry; and in this fignification it is used. No laches shall be adjudged in the heir within age; and regularly, laches shall not bar infants or femme coverts for not entry or claim, to avoid descents; but laches shall be accounted in them for non-performance of a condition annexed to the state selves was very concise, and much to the purpose. See of the land.

LACHESIS, in mythology, one of the Parcæ. Her name is derived from ARXIV, to measure out by lot. She prefided over futurity, and was reprefented as fpinning the thread of life, or, according to others, holding the spindle. She generally appeared covered with a garment variegated with flars, and holding

fpindles in her hand.

LACHISH, (anc. geog.) a city fouthward of the tribe of Judah. Eufebius and St Jerom tell us, that in their time there was a village called Lachifb, feven miles from Eleutheropolis, fouthward. Sennacherib befieged Lachish, but did not take it. From thence it was that he fent Rabshakeh against Jerusalem. Here King Amaziah was flain by his rebel fubjects.

LACHNEA, in botany: A genus of the monogynia order, belonging to the octandria class of plants; and in the natural method ranking under the 31st order, Veprecula. There is no calyx; the corolla is quadrifid with the limb unequal; there is one feed a little

refembling a berry

LACHRYMAL, in anatomy, an appellation given to feveral parts of the eye. See ANATOMY, p. 766.

col. 1.

LACHRYMATORY, in antiquity, a veffel wherein were collected the tears of a deceased person's friends, and preferved along with the ashes and urn. They were finall glass or earthen bottles, chiefly in the form of phials. At the Roman funerals, the friends of the deceased, or the prasica, women hired for that purpose, used to fill them with their tears, and deposit them very carefully with the ashes in testimony of their Vol. IX. Part II.

thereby greatly comforted. Many fpecimens of them Lacquers. are preferved in the cabinets of the curious, particu-

larly in the British Museum.

LACINIUM (anc. geog.), a noble promontory of the Brutii in Italy, the fouth boundary of the Sinus Tarentinus and the Adriatic; all to the fouth of it being deemed the Ionian Sea: it was famous for a rich temple of Juno, furnamed Lacinia, with a pillar of folid gold flanding in it; which Hannibal intending to carry off, was, according to Cicero, diffuaded by a dream. Now Capo delle Colonne, from the columns of Juno's temple still standing on the north-east coast of the Calabria ultra.

LACK of RUPEES, is 100,000 rupees; which, supposing them standard, or siccas, at 28. 6d. a-

mounts to 12,500 l. Sterling.

LACONIA, or LACONICA, a country on the fouthern parts of Peloponnesus, having Argos and Arcadia on the north, Messenia on the west, the Mediterranean on the fouth, and the bay of Argos at the eaft. Its extent from north to fouth was about 50 miles. It was watered by the river Eurotas. The capital was called Sparta, or Lacedæmon : (See LACE-DEMON and SPARTA.) The brevity with which the Laconians always expressed themselves is now become proverbial; and by the epithet of Laconic, we underftand whatever is concife, and is not loaded with unnecessary words.

LACONICUM, (whence our term laconic), a short pithy fententious speech, fuch as the Lacedæmonians were remarkable for: Their way of delivering them-

" the preceding article.

LACQUERS, are varnishes applied upon tin, brass, and other metals, to preferve them from tarnishing, and to improve their colour. The basis of lacquers is a folution of the refinous fubstance called feed lac, in fpirit of wine. The fpirit ought to be very much dephlegmated, in order to diffolve much of the lac. For this purpose, some authors directly dry potash to be thrown into the spirit. This alkali attracts the water, with which it forms a liquid that fubfides distinctly from the spirit at the bottom of the veffel. From this liquid the fpirit may be feparated by decantation. By this method the spirit is much dephlegmated; but, at the fame time, it becomes impregnated with part of the alkali, which depraves its colour, and communicates a property to the lacquer of imbibing moisture from the air. These inconveniences may be prevented by distilling the spirit; or, if the artist has not an opportunity of performing that process, he may cleanse the spirit in a great measure from the alkali, by adding to it fome calcined alum: the acid of which uniting with the alkali remaining in the spirit, forms with it a vitriolated tartar, which, not being foluble in spirit of wine, falls to the bottom together with the earth of the decomposed alum. To a pint of the dephlegmated and purified fpirit, about three ounces of powdered shell-lac are to be added; and the mixture to be digefted during fame day with a moderate heat. The liquor ought then to be poured off, ftrained, and cleared by fettling, This clear liquor is now fit to receive the required colour from certain refinous colouring fubstances, the

principal

Lactacio. principal of which are gamboge and annotto; the former of which gives a yellow, and the latter an orange colour. In order to give a golden colour, two parts of gamboge are added to one of annotto; but these colouring fubitances may be feparately diffolved in the tincture of lac, and the colour required may be adjusted by mixing the two folutions in different proportions. When filver leaf or tin are to be lacquered, a larger quantity of the colouring materials are requifite than when the lacquer is intended to be laid

Motherby'. Diclionary.

on brafs LACTATIO, LACTATION, among medical writers, denotes the giving fuck. The mother's breast, if possible, should be allowed the child, at least during the first month; for thus the child is more peculiarly benefited by what it fucks, and the mother is preferved from more real inconveniences than the fallely delicate imagine they would fuffer by compliance herewith: but if by reason of an infirm constitution, or other causes, the mother cannot fuckle her child, let dry nurfing under the mother's eye be purfued.

When women lofe their appetite by giving fuck, both the children and themselves are thereby injured; wet nurses are to be preferred, who, during the time they give the breaft, have rather an increased appetite, and digest more quickly; the former are apt to waste away, and sometimes die consumptive. In fhort, those nurses with whom lactation may for a while agree, should wean the child as foon as their appetite leffens, their strength feems to fail, or a tendency to hyfteric fymptoms are manifest.

When the new-born child is to be brought up by the mother's breaft, apply it thereto in ten or twelve hours after delivery; thus the milk is fooner and more eafily fupplied, and there is lefs hazard of a fever than when the child is not put to it before the milk begins to flow of itfelf.

If the mother does not suckle her child, her breafts should be so kept warm with slannels, or with a harefkin, that a constant perspiration may be supported; thus there rarely will arise much inconvenience from

The child, notwithstanding all our care in dry nurfing, fometimes pines if a breaft is not allowed. In this case a wet nurse should be provided, if possible one that hath not been long delivered of a child. She should be young, of a healthy habit, and an active disposition, a mild temper, and whose breasts are well filled with milk. If the milk is good, it is fweetish to the taste, and totally free from faltness; to the eye it appears thin, and of a bluish cast. That the woman hath her menses, if in other respects objections are not made, this need not be any; and as to the custom with many, of abstaining from venery while they continue to fuckle a child, it is fo far without reason to support it, that the truth is, a rigorous chastity is as hurtful, and often more pernicious, than an immoderate use of venery. Amongst the vulgar errors, is that of red-haired women being improper for wet nurses.

If the menfes do not appear during the first months, but after fix or eight months fuckling they begin to descend, the child should be weaned.

Wet nurses should eat at least one hearty meal of animal-food every day; with this a proper quantity of vegetables should be mixed. Thin broth or milk are

proper for their breakfasts and their suppers; and if Lastantius the strength should feem to fail a little, a draught of good ale should now and then be allowed : but spirituous liquors must in general be forborne; not but a. fpoonful of rum may be allowed in a quart of milk and water, (i. e. a pint of each), which is a proper common drink.

Though it is well ooferved by Dr Hunter, that the far greater number of those women who have cancers in the breaft or womb are old maids, and those who refuse to give fuck to their children; vet it is the unhappiness of some willing mothers not to be able : for instance, those with tender constitutions, and who are fubiect to nervous disorders; those who do not eat a fufficient quantity of folid food, nor enjoy the benefit of exercise and air: if children are kept at their breasts, they either die whilst young, or are weak and fickly after childhood is past, and so on through remaining life.

LACTANTIUS, (Lucius Cœlius Firmianus), a celebrated author at the beginning of the 4th century. was, according to Baronius, an African; but, according to others, was born at Fermo in the marquifate of Ancona, from whence it is imagined he was called Firmianus. He studied rhetoric under Arnobius; and was afterwards a professor of that science in Africa and Nicomedia, where he was fo admired, that the emperor Constantine chose him preceptor to his fon Crispus Cæfar. Lactantius was fo far from feeking the pleafures and riches of the court, that he lived there in poverty, and, according to Eufebius, frequently wanted necessaries. His works are written in elegant Latin. The principal of which are, I. De ira divina. 2. De operibus Dei, in which he treats of the creation of man, and of divine providence. 3. Divine Institutions, in feven books. This is the most considerable of all his works: he there undertakes to prove the truth of the Christian religion, and to refute all the difficulties that had been raifed against it; and he folidly, and with great strength, attacks the illusions of paganism. His ftyle is pure, clear, and natural, and his expressions noble and elegant, on which account he has been called the Cicero of the Christians. There is also attributed to him a treatife De morte persecutorum; but several of the learned doubt its being written by Lactantius. The most copious edition of Lactantius's works is that of Paris in 1748, 2 vols 4to.

LACTEALS, or LACTEAL VESSELS, a kind of long flender tubes for the conveyance of the chyle from the intestines to the common refervatory. See ANATOMY, nº 105.

LACTIFEROUS, an appellation given to plants abounding with a milky juice, as the fow-thittle and the like. The name of ladiferous, or ladefcent, is given to all those plants which abound with a thick-coloured juice, without regarding whether it is white or not. Most lactiferous plants are poisonous, except those with compound flowers, which are generally of

an innocent quality. Of the poisonous lactescent plants the most remarkable are fumach, agaric, maple, burning thorny plant, caffada, celandine, puccoon, prickly poppy, and the plants of the natural order contorta, as iwallow-wort, apocynum, cynanchum, and cerbera.

The bell-shaped flowers are partly noxious, as cardinal flower; partly innocent, as campanula.

Among

Among the lactescent plants with compound flowers that are innocent in their quality, may be mentioned dandelion, picris, hyoferis, wild lettuce, gum-fuccory, hawk-weed, bastard hawk weed, hypocheeris, goat'sbeard, and most species of lettuce: we say most species, because the prickly species of that genus are faid to be of a very virulent and poisonous nature; though Mr Lightfoot denies this, and affirms that they are a fafe and gentle opiate, and that a fyrup made from the leaves and flalks is much preferable to the common

LACTUCA, in botany : A genus of the polygamia æqualis order, belonging to the fyngenefia class of plants: and in the natural method ranking under the 40th order, Composite. The receptacle is naked; the calvx imbricated, cylindrical, with a membranaceous margin; the pappus is fimple, flipated, or flalked. There are feveral species, most of which are plants of no use, and never cultivated but in botanic gardens for variety. Those commonly cultivated in the kitchen-garden for use, are, I. The common or garden lettuce. 2. Cabbage lettuce. 3. Silesia lettuce. 4. Dutch brown lettuce. 5. Aleppo lettuce. 6. Imperial lettuce. 7. Green capuchin lettuce. 8. Verfailles or upright white Cos lettuce. 9. Black Cos. 10. Red Cos. 11. Red capuchin lettuce. 12. Roman lettuce. 13. Prince lettuce. 14. Royal lettuce.

15. Egyptian Cos lettuce. Culture, &c. The first of these forts is very common in all gardens, and is commonly fown for cutting very young, to mix with other falad herbs in fpring; and the fecond, or cabbage lettuce, is only this mended by culture. It may be fown at all times of the year, but in the hot months requires to be fown in shady borders. The cabbage-lettuce may also be sown at different seafons, to have a continuation of it through the fummer. The first crop should be fown in February, in an open fituation; the others at three weeks diffance; but the later ones under covert, but not under the drippings of trees. The Silefia, imperial, royal, black, white, and upright Cos lettuces, may be first fown in the latter end of February or the beginning of March, on a warm light foil, and in an open fituation; when the plants are come up, they must be thinned to 15 inches distance every way, they will then require no farther care than the keeping them clear of weeds; and the black Cos, as it grows large, should have its leaves tied together to whiten the inner part. Succeeding crops of these should be sown in April, May, and June; and toward the latter end of August they may be sown for a winter crop, to be preserved under glasses, or in a bed arched over with boops and covered with mats. The most valuable of all the English lettuces are the white Cos or the Verfailles, the Silesia, and the black Cos. The brown Dutch and the green capuchin are very hardy, and may be fown late under walls, where they will stand the winter, and be valuable when no others are to be had. The red capuchin, Roman, and prince lettuce, are very early kinds, and are fown for variety; as are also the Aleppo ones for the beauty of

their spotted leaves. Properties. The feveral forts of garden lettuces are

writers suppose that they have a narcotic quality; and Lacunz indeed in many cases they contribute to procure rest; Laider, this they effect by abating heat, and relaxing the fibres. The feeds are in the number of the four leffer cold feeds.

The virofa, or strong-scented wild lettuce, which is indigenous in Britain, and grows in fome places in confiderable abundance, differs very effentially in its qualities from the garden lettuce. Although it has not been introduced into any of the modern pharmacopocias, yet it has of late been highly extolled for fome purposes in medicine. It smells strongly of opium, and refembles it in some of its effects; and its narcotic power, like that of the poppy heads, refides in its milky juice. An extract from the expressed juice is recommended in small doses in dropfy. In dropfies of long flanding, proceeding from vifceral obstructions, it has been given to the extent of half an ounce a-day. It is said to agree with the stomach, to quench thirst, to be gently laxative, powerfully diuretic, and fomewhat diaphoretic. Plentiful dilution is allowed during its operation. Dr Collin of Vienna afferts, that out of 24 dropfical patients, all but one were cured by this medicine.

LACUNÆ, among anatomifts, certain excretory

canals in the genital parts of women.

LACUNAR, in architecture, an arched roof or ceiling, more especially the planking or flooring above

porticos or piazzas.

LACYDES, a Greek philosopher, born at Cyrene, was the disciple of Arcefilaus, and his successor in the academy. He taught in a garden given him by Attalus king of Pergamus; but that prince fending for him to court, he replied, "That the pictures of kings should be viewed at a distance." He imitated his master in the pleasure he took in doing good without caring to have it known: he had a goofe which followed him every where by night as well as by day; and when she died, he made a funeral for her, which was as magnificent as if it had been for a fon or a brother. He taught the same doctrine as Arcefilaus; and pretended that we ought to determine nothing, but always to suspend our opinion. He died 212 B. C.

LADDER, a frame made with a number of steps, by means of which people may afcend as on a flair to

places otherwise inaccessible.

Scaling LADDERS, in the military art, are used in fealing when a place is to be taken by furprife. They are made feveral ways: here we make them of flat staves, fo that they may move about their pins, and thut like a parallel ruler, for conveniently carrying them: the French make them of feveral pieces, fo as to be joined together, and to be made of any necessary length: fometimes they are made of fingle ropes, knotted at proper distances, with iron books at each end, one to faften them upon the wall above, and the other in the ground; and fometimes they are made with two ropes, and flaves, between them, to keep the ropes at a proper diflance, and to tread upon. When they are used in the action of scaling walls, they ought to be rather too long than too fliort, and to be given in charge only to the floutest of the detachment. The foldiers should carry these ladders with very wholesome, emollient, cooling salad herbs, easy the left arm passed through the second step, taking of digeftion, and somewhat loofening the belly. Most care to hold them upright close to their fides, and

Ladogna.

Laden very short below, to prevent any accident in leaping with a bishop's see. E. Long. 15. 12. N. Lat. Ladon; into the ditch.

The first rank of each division, provided with ladders, should fet out with the rest at the fignal, marching refolutely with their firelocks flung, to jump into the ditch; when they are arrived, they should apply their ladders against the parapet, observing to place them towards the falient angles rather than the middle of the curtain, because the enemy have less force there. Care must be taken to place the ladders within a foot of each other, and not to give them too much nor too little flope, fo that they may not be overturned or broke with the weight of the foldiers mounting upon them.

The ladders being applied, they who have carried them, and they who come after, should mount up, and rush upon the enemy fword-in-hand: if he who goes first, happens to be overturned, the next should take care not to be thrown down by his comerade; but, on the contrary, immediately mount himfelf, fo as not to give the enemy time to load his piece.

As the foldiers who mount first may be easily tumbled over, and their fall may cause the attack to fail, it would perhaps be right to protect their breafts with the fore-parts of cuiraffes; because, if they can pene-

trate, the rest may easily follow.

The fuccess of an attack by scaling is infallible, if they mount the four fides at once, and take care to shower a number of grenades amongst the enemy, specially when supported by some grenadiers and picquets, who share the attention and fire of the

LADEN, in the fea-language, the flate of a ship when she is charged with a weight or quantity of any fort of merchandifes, or other materials, equal to her tonage or burden. If the cargo with which she is laden is extremely heavy, her burden is determined by the weight of the goods; and if it is light, the carries as much as the can flow, to be fit for the purpofes of navigation. As a ton in measure is generally estimated at 2000 lb. in weight, a veffel of 200 tons ought accordingly to carry a weight equal to 400,000lb. when the matter of which the cargo is composed is specifically heavier than the water in which fhe floats; or, in other words, when the cargo is fo heavy that she cannot float high enough with fo great a quantity of it as her hold will contain.

LADEN in Bulk, the state of being freighted with a cargo which is neither in casks, boxes, bales, nor cases, but lies loofe in the hold; being defended from the moisture or wet of the hold, by a number of mats and a quantity of dunage. Such are usually the cargoes of

corn, falt, or fuch materials.

LADENBURG, a town of Germany in the Palatinate of the Rhine, feated on the river Neckar, in E. Long. 8. 42. N. Lat. 49. 27. It belongs to the bishopric of Worms, and the elector Palatine.

LADISLAUS, the name of several kings of Poland.

See POLAND.

LADOGA, a town of the Ruffian empire, feated on a great lake of the fame name, which has a communication with the gulf of Finland, by the river Nieva; and it abounds in fish, particulary falmon. E. Lon. 33. 29. N. Lat. 60. 0.

LADON (anc. geog.) a river of Arcadia falling into the Alpheus. The metamorphofis of Daphne into a laurel, and of Syrinx into a reed happened near its banks.

LADRONE or MARIAN islands, a cluster of twelve islands lying in the Pacific Ocean, in about 145° of east longitude, and between the 11th and 21st degree of north latitude. They were first discovered by Magellan, who failed round the world through the Straits which bear his name. He gave them the name of Ladrone Islands, or the Islands of Thieves, from the thievith disposition of the inhabitants. At the time these islands were discovered by the Europeans, the natives were totally unacquainted with any other country befides their own; and having no traditionary accounts of their own origin, they imagined that the author of their race was formed of a piece of the rock of Funa, one of their fmallest islands. Many things looked upon by us as absolutely necessary to our existence, were utterly unknown to these people. They had no animals of any fort; and would not even have had any idea of them, had it not been for the birds; and even of them they had but one species, somewhat like the turtle dove, which they never killed for eating, but only tamed them, and taught them to fpeak. They were much aftonished on seeing a horse which a Spanish captain left among them in 1673. and could not for a long time be fatisfied with admiring him. But what is most furprifing and incredible in their history is, that they were utterly unacquainted with the element of fire till Magellan, provoked by their repeated thefts, burned one of their villages. When they faw their wooden houses blazing, they first thought that the fire was a beast which fed upon the wood; and fome of them who came too near, being burnt, the rest stood at a distance, lest they should be devoured or poisoned by the breathings of this terrible animal

The inhabitants of the Ladrones are olive-coloured, but not of fuch a deep dye as those of the Philippine islands; their stature is good, and their limbs well proportioned. Though their food consists entirely of fish, fruits, and roots, yet they are fo fat, that to strangers they appear swelled, but this does not render them less nimble and active. They often live to 100 years or more, yet retain the health and vigour of men. of 50. The men go stark naked, but the women are covered. They are not ill-looked, and take great care of their beauty, though their ideas on that fubject are very different from ours. They love black teeth and white hair. Hence one of their principal occupations is to keep their teeth black by the help of certain herbs, and to whiten their hair, fprinkling upon it a certain water for this purpose. The women have their hair very long; but the men generally shave it close, except a fingle lock on the crown of the head, after the manner of the Japanese. Their language much refembles that of the people called Tagales in the Philippine islands. It is agreeable to the ear, with a foft and eafy pronunciation. One of its chief graces confifts in the facility of transposing words, and even all the fyllables of one word; and thus furnishing a va-LADOGNA, or LACEDGONA, a town of Italy, riety of double meanings, with which these people are in the kingdom of Naples, and in the Capitanata, greatly delighted. Though plunged in the deepett ignorance,

Ladrone, ignorance, and deftitute of every thing valued by the Lady. reft of mankind, no nation ever showed more presumption, or a greater conceit of themselves, than these islanders, looking on their own nation as the only wife, fensible, and polished one in the world, and beholding every other people with the greatest contempt. Though they are ignorant of the arts and sciences, yet, like every other nation, they have their fables which ferve them for history, and some poems which they greatly admire. A poet is with them a character of the first

eminence, and greatly respected. We neither know at what time nor from what place the Ladrone islands were first peopled. As Japan lies within fix or feven days fail of them, fome have been induced to believe, that the first inhabitants of the Ladrones came from Japan. But from their greater refemblance to the inhabitants of the Philippine islands than to the Japanefe, it is more probable that they came from the former than the latter. Formerly most of the islands were inhabited; and about 90 years ago, the three principal islands, Guam, Tinian, and Rota, are faid to have contained 50,000 people; but fince that time, Tinian hath been entirely depopulated, and only 200 or 300 Indians left at Rota to cultivate rice for the island of Guam, which alone is inhabited by Europeans, and where the Spaniards have a governor and a garrison: here also the annual Manilla thip touches for refreshments in her passage from Acapulco to the Philippines. The idand of Tinian afforded an afylum to Commodore Anfon in 1742; and the mafterly manner in which the author of that voyage paints the natural beauties of the country, hath given a degree of estimation not only to this island, but to all the rest, which they had not before. Commodore Byron, in 1765, continued nine weeks at Tinian, and anchored in the very spot where the Centurion lay; but gives a much less favourable account of this climate and country than the former navigator. The water, he fays, is brackish, and full of worms; many of his men were fiezed with fevers, occasioned by the intense heat; the thermometer, which was kept on board the ship, generally stood at 86°, which is but 10 or 11 degrees less than the heat of the blood at the heart; and had the instrument been ashore, he imagines it would have flood much higher than it did. It was with the greatest difficulty that they could penetrate through the woods; and when they had fortunately killed a bull, and with prodigious labour dragged it through the forests to the beach, it stunk, and was full of fly-blows by the time it reached the shore. The poultry was ill-tafted; and within an hour after it was killed, the flesh became as green as grass, and fwarmed with maggots. The wild hogs were very fierce; and fo large, that a carcafe frequently weighed 200 pounds. Cotton and indigo were found on the island. Captain Wallis continued here a month in 1767, but makes no fuch complaints.

LADY. This title is derived from two Saxon words, which fignify loaf-day, which words have in time been contracted into the present appellation. It properly belongs only to the daughter of earls, and all of higher rank; but custom has made it a word of complaifance for the wives of knights and of all emi-

As to the original application of this expression, it

AE may be observed, that heretofore it was the fashion for those families, whom God had bleffed with affluence, to live constantly at their mansion-houses in the country, and that once a-week, or oftener, the lady of the manor distributed to her poor neighbours, with her orun hands, a certain quantity of bread; but the practice, which gave rife to this title is now as little known as the meaning of it; however, it may be from that hospitable custom, that to this day the ladies in this kingdom alone serve the meat at their own table.

LADT's Bedftraw. See GALLIUM. LADY'S Mantle. See ALCHEMILLA. LADY'S Smock. See CARDAMINE.

LADY'S Slipper. See CYPRIPEDIUM.

LADY'S Traces. See OPHRYS.

LADY-Day, in law, the 25th of March, being the annunciation of the Holy Virgin. See ANNUNCIATION.

LÆLIUS (Caius), a Roman conful and great orator, furnamed the Wife, diftinguished himself in Spain in the war against Viriathus the Spanish general. He is highly praifed by Cicero, who gives an admirable description of the intimate friendship which sublisted between Lælius and Scipio Africanus the Younger-His eloquence, his modesty, and his abilities, acquired him a great reputation; and he is thought to have affisted Terence in his comedies. He died about 126 B. C.

LÆNA, in antiquity, was a gown worn by the Roman augurs, and peculiar to their office. In this gown they covered their heads when they made their observations on the flight of birds, &c. See Augur.

LAER. See BAMBOCCIO.

LÆSTRYGONES, the most ancient inhabitants of Sicily. Some suppose them to be the same as the people of Leontium, and to have been neighbours to the Cyclops. They fed on human flesh; and when Ulvsfes came on their coasts, they funk his ships and devoured his companions. They were of a gigantic flature, according to Homer's description. A colony of them, as some suppose; passed over into Italy with Lamus at their head, where they built the town of Formiæ, whence the epithet of Lastrygonia is often used for that of Formiana.

LAET (John de), a writer in the 17th century, born at Antwerp, was director of the West India company. He acquired great skill in the languages, in history, and geography; and had the management of Elzevir's edition of A Description of most Kingdoms in the World, printed in Latin. He wrote in French, A Description of the East Indies, and other works :

and died in 1649.

LAETIA, in botany: A genus of the monogynia order, belonging to the polyandria class of plants; and in the natural method ranking with those of which the order is doubtful. The corolla is pentapetalous, or none; the calyx is pentaphyllous; the fruit unilocular and trigonal; the feeds have a pulpy arillus or coat. There are two species, both natives of America. One of them, the apetala, or gum wood, Dr Wright informs us, is very common in the woodlands and copfes of Jamaica, where it rifes to a confiderable height and thickness. The trunks are smooth and white; the leaves are three inches long, a little ferrated, and fomewhat hairy. The stamina are yellow, without petals: the fruit is as large as a plum; and when ripe,

opens

Laireffe.

Lavinus opens and shows a number of small feeds in a reddish pulp. Pieces of the trunk or branches, suspended in the heat of the fun, discharge a clear turpentine or balfam, which concretes into a white refin, and which feems to be the fame as gum fandarach. Pounce is there made of it; and our author is of opinion, that it might be ufeful in medicine like other gums of the fame nature.

LÆVINUS (Torrentinus), commonly called Vander Bekin, or Torrentin, was a native of Ghent, and bred in the university of Louvain. He afterwards made the tour of Italy, where his virtues obtained him the friendship of the most illustrious personages of his time. On his return to the Low Countries: he was made canon of Leige, and vicar-general to Ernest de Baviere, bishop of that see. At length, having executed a successful embassy to Philip II. of Spain, he was rewarded with the bishopric of Antwerp; from whence he was translated to the metropolitan church of Mechlin, and died there in 1595. He founded a college of Jesnits at Louvain, to which he left his library, medals, and curiofities. He wrote feveral poems that procured him the character of being, after Horace, the prince of the lyric poets.

LÆVIUS, a Latin poet. It is not well known. when he lived, but probably he was more ancient than Cicero. He made a poem intitled Erotopagnia, i. e. love games. Aulus Gellius quotes two lines of it. Apuleius also quotes fix lines from the same poet ; but he does not tell from what work he borrowed them. Lævius had also composed a poem intitled The Centaurs, which Festus quotes under the title of Pe-

trarum.

LAGAN, or LAGON. See FLOTSOM.

LAGEMAN (lagammannus), homo babens legem, or homo legalis feu legitimus; fuch as we call now "good men of the jury." The word is frequently used in Domesday, and the laws of Edward the Confessor, cap. 38.

LAGEN (lagens), in ancient time, was a meafure of wine, containing fix fextarii: whence probably is derived our flagon. The lieutenant of the tower has the privilege to take unam lagenam vini ante malum & retro, of all wine ships that come upon the Thames; and Sir Peter Leicester, in his Antiquities of Cheshire, interprets lagena vini, "a bottle of wine."

LAGERSTROEMIA, in botany; a genus of the monogynia order, belonging to the polyandria class of plants. The corolla is hexapetalous, and curled; the calyx fexfid, and campanulated; there are many flamina, and of thefe the fix exterior ones thicker than

the reft, and longer than the petals.

LAGNY, a town of the ifle of France, with a famous benedictine abbey. It is feated on the river Marne, in E. Long. 2. 45. N. Lat. 48. 50.

LAGOECIA, in botany; a genus of the monogynia order, belonging to the pentandria class of plants. The involucrum is univerfal and partial; the

petals bifid; the feeds folitary, inferior.

LAGOON ISLAND, one of the new discovered islands in the South Sea, lying in S. Lat. 18. 47. W. Long. 139. 28. It is of an oval form, with a lake in the middle, which occupies much the greatest part of it. The whole island is covered with trees of different growth. It is inhabited by a race of Indians, tall, of a copper colour, with long black hair. Their weapons are poles or spikes, which are twice as long as Lagopus themselves. Their habitations were seen under some clumps of palm-trees, which formed very beautiful groves. This island was discovered by Captain Cook in April 1769.

LAGOPUS, in ornithology. See TETRAO.

LAGOS, a fea-port town of Portugal, in the province of Algarva, with a castle near the sea, where there is a good harbour, and where the English fleets bound to the Straits usually take in fresh water. W.

Long. 8. 5. N. Lat. 36. 45. LAGUNA, or San Christoval de Laguna, a confiderable town in the island of Teneriss, near a lake of the fame name, on the declivity of a hill. It has very handsome buildings, and a fine square. W. Long.

16. 24. N. Lat. 28. 30.

LAGUNES OF VENICE, are marshes or lakes in Italy on which Venice is feated. They communicate with the fea, and are the fecurity of the city. There are about 60 islands in these Lagunes, which together make a bishop's see. Eurano is the most considerable, next to those on which Venice stands.

LAGURUS, in botany: A genus of the digynia order, belonging to the triandria class of plants; and in the natural method ranking under the 4th order, Gramina. The calyx is bivalved, with a villous awn; the exterior petal of the corolla terminated by two awns, with a third on its back retorted.

LAHOLM, a fea-port town of Sweden, in the province of Gothland, and territory of Holland, feated near the Baltic Sea, with a castle and a harbour, in

E. Long. 13. 13. N. Lat. 56. 35. LAHOR, a large town of Afia, in ⁷ndoftan, and capital of a province of the fame name, and one of the most considerable in the Mogul's dominions. It is of a valt circumference, and contains a great number of mosques, public baths, caravanseras, and pagods. It was the refidence of the Great Mogal; but fince the removal of the court, the fine palace is going to decay. There is a magnificent walk of shady trees, which runs from this to Agra, that is upwards of 300 miles. Here they have manufactures of cotton cloths and fluffs of all kinds, and they make very curious carpets. E. Long. 75. 55. N. Lat. 31. 40.

LAINEZ (James), a Spaniard, companion of Ignatius of Loyola, fecond general of the Jesuits, and a man of a more daring and political character. Having procured from pope Paul IV. the perpetual generalship of the new order of Jesuits, after the death of Ignatins, he got the following privileges ratified by that pontiff, which show that he was in fact the founder of the worst part of their institution: 1. The right of making all forts of contracts (without the privity of the community) vested in the generals and their delegates. 2. That of giving authenticity to all comments and explanations of their constitutions. 3. The power of making new, and altering the old: this opened the door to their bloody political tenets, not to be attributed to Loyola. 4. That of having prisons independent of the fecular authority, in which they put to death refractory brethren. Lainez died in 1565,

LAIRESSE (Gerard), an eminent Flemish painter, born at Leige in 1640. He received the principal part of his instruction from his father Renieve de

Lairesse,

Laireffe, though he is also accounted a disciple of Bar- finated her in the temple of Venus, about 340 years Laity, diffreffed circumftances; but an accidental recommendation carrying him to Amsterdam, he foon exchanged want and obscurity for assuence and reputation. He was a perfect matter of hittory; his deligns are diftinguished by the grandeur of the composition; and the back grounds, wherever the fubjects required it, are rich in architecture, which is an uncommon circumftance in that country. He had the unhappiness to lofe his fight feveral years before his death, which happened in 1711; fo that the treatife on defign and colouring, which paffes under his name, was not wrote by him, but collected from his observations after he was blind, and published after his death. He had three fons, two of whom were painters; and also three brothers, Erneft, James, and John : Erneft and John painted animals, and James was a flower painter. He engraved a good deal in aquafortis: his works confift of 256 plates, above half of which were done with his own hand. He wrote an excellent book on the art, which has been translated into English, and printed at London both in 4to and 8vo.

LAIS, a celebrated courtezan, daughter of Timandra the mistress of Alcibiades, born at Hyccara in Sicily. She was carried away from her native Greece, when Nicias the Athenian general invaded Sicily. She first began to fell her favours at Corinth for 10,000 drams, and the immense number of princes, noblemen, philosophers, orators, and plebeians which courted her embraces, show how much commendation is owed to her personal charms. The expenses which attended her pleasures, gave rife to the proverb of Non cuivis homini contingit adire Corinthum. Even Demosthenes himfelf vifited Corinth for the fake of Lais; but when he was informed by the courtezan, that admittance to her bed was to be bought at the enormous fum of about 200 l. English money, the orator departed, and observed that he would not buy repentance at so dear a price. The charms which had attracted Demosthenes to Corinth, had no influence upon Xenocrates. When Lais faw the philosopher unmoved by her beauty, she visited his house herself; but there she had no reafon to boast of the licentiousness or easy submission of Xenocrates. Diogenes the cynic was one of her warmest admirers, and though filthy in his dress and manners, yet he gained her heart and enjoyed her most unbounded favours. The sculptor Mycon also solicited the favours of Lais, but he met with coldness: he, however, attributed the cause of his ill reception to the whiteness of his hair, and dyed it of a brown colour, but to no purpose: " Fool that thou art (faid the courtezan) to ask what I refused yesterday to thy father." Lais ridiculed the aufterity of philosophers, and laughed at the weakness of those who pretend to have gained a superiority over their passions, by obferving, that the fages and philosophers of the age were not above the reft of mankind, for the found them at her door as often as the rest of the Athenians. The success which her debaucheries met at Corinth encouraged Lais to pass into Thessaly, and more particularly to enjoy the company of a favourite youth called Hippostratus. She was however disappointed: the women of the place, jealous of her charms, and apprehensive of her corrupting the fidelity of their husbands, affaf-

tolet. He first fettled at Utrecht, where he lived in before the Christian era. Some suppose that there, were two persons of this name, a mother and her daughter.

LAITY, the people as diffinguished from the clergy; (fee CLERGY). The lay part of his majefty's fubiects is divided into three diffinct flates: the civil. the military, and the maritime. See Civil, Mili-

LAKE, a collection of waters contained in fome cavity in an inland place, of a large extent, furrounded with land, and having no communication with the ocean. Lakes may be divided into four kinds. I. Such as neither receive nor fend forth rivers. 2. Such as emit rivers, without receiving any. 3. Such as receive rivers, without emitting any. And, 4. Such as both receive and fend forth rivers. Of the first kind, some are temporary and others perennial. Most of those that are temporary owe their origin to the rain, and the cavity or depression of the place in which they are lodged: thus in India there are feveral fuch lakes made by the industry of the natives, of which some are a mile, and fome two, in circuit; these are furrounded with a stone-wall, and being filled in the rainy months. fupply the inhabitants in dry feafons, who live at a great distance from fprings or rivers. There are also feveral of this kind formed by the inundations of the Nile and the Niger; and in Muscovy, Finland, and Lapland, there are many lakes formed, partly by the rains, and partly by the melting of the ice and fnow : but mest of the perennial lakes, which neither receive nor emit rivers, probably owe their rife to fprings at the bottom, by which they are constantly supplied. The fecond kind of lakes, which emit without receiving rivers, is very numerous. Many rivers flow from these as out of cifterns; where their springs being situated low within a hollow place, first fill the cavity. and make it a lake, which not being capacious enough to hold all the water, it overflows and forms a river: of this kind is the Wolga, at the head of the river Wolga; the lake Odium, at the head of the Tanais; the Adac, from whence one branch of the river Tigris flows; the Ozero, or White lake, in Mufcovy, is the fource of the river Shakfna. The great lake Chaamay, which emits four very large rivers, which water the countries of Siam, Pegu, &c. viz. the Menan, the Afa, the Caipoumo, and the Laquia, &c. The third species of lakes, which receive rivers but emit none, apparently owe their origin to those rivers which, in their progress from their source, falling into fome extensive cavity, are collected together, and form a lake of fuch dimensions as may lefe as much by exhalation as it continually receives from thefe fources: of this kind is that great lake improperly called the Caspian Sea; the lake Asphaltites, also called the Dead Sea; the lake of Geneva, and feveral others. Of the fourth species, which both receive and emit rivers, we reckon three kinds, as the quantity they emit is greater, equal or lefs, than they receive. If it be greater, it is plain that they must be supplied by iprings at the bottom; if lefs, the furplus of the water is probably spent in exhalations; and if it be equal, their fprings just supply what is evaporated by the fun.

Lakes are also divided into those of fresh water and

Lake, those of falt. Dr Halley is of opinion, that all great perennial lakes are faline, either in a greater or less degree; and that this faltness increases with time; and on this foundation he proposes a method for determining the age of the world.

Large lakes answer the most valuable purposes in the northern regions, the warm vapours that arise from them moderating the pinching cold of those climates; and what is still a greater advantage, when they are placed in warmer climates at a great distance from the fea, the exhalations raifed from them by the fun caufe the countries that border upon them to be refreshed with frequent showers, and confequently prevent their being barren defaits.

LAKE, or Laque, a preparation of different substances into a kind of magistery for the use of painters. One of the finest and first invented of which was that of gum-lacca or lacque; from which all the rest, as made by the same process, are called by the common

name lacques. See LACCA. The method of preparing these, in general, may be known by the example of that of the curcuma-root of the shops, called turmeric root; the process for the making of which is this: Take a pound of turmericroot in fine powder, three pints of water, and an ounce of falt of tartar; put all into a glazed earthen veffel, and let them boil together over a clear gentle fire, till the water appears highly impregnated with the root, and will ftain a paper to a beautiful yellow. Filtre this liquor, and gradually add to it a ftrong folution of roch alum in water, till the yellow matter is all curdled together and precipitated; after this pour the whole into a filtre of paper, and the water will run off and leave the yellow matter behind. It is to be washed many times with fresh water, till the water comes off infipid, and then is obtained the beautiful vellow called lacque of turmeric, and used in paint-

In this manner may a lake be made of any of the tinging substances that are of a somewhat strong texture, as madder, logwood, &c. but it will not fucceed in the more tender species, as the flowers of roses, violets, &c. as it destroys the nice arrangement of parts in those subjects on which the colour depends.

A yellow lake for painting is to be made from broom flowers in the following manner: Make a ley of pot-ashes and lime reasonably strong; in this boil, at a gentle fire, fresh bloom flowers till they are white, the ley having extracted all their colour; then take out the flowers, and put the ley to boil in earthen veffels over the fire; add as much alum as the liquor will diffolve; then empty this ley into a veffel of clean water, and it will give a yellow colour at the bottom. Let all fettle, and decant off the clear liquor. Wash this powder, which is found at the bottom, with more water, till all the falts of the ley are washed off; then separate the yellow matter, and dry it in the shade. It proves a very valuable yellow.

Lake is at prefent feldom prepared from any other fubstance than scarlet rags, cochineal, and Brasil wood. to the Arts, The best of what is commonly fold is made from the colour extracted from scarlet rags, and deposited on p. 61, &c. the cuttle-bone; and this may be prepared in the following manner: Diffolve a pound of the best pearl-

afhes in two quarts of water, and filtre the liquor thro' Lake. paper; add to this folution two more quarts of water and a pound of clean fcarlet shreds, and boil them in a pewter boiler till the fhreds have loft their fearlet colour; take out the shreds and press them, and put the coloured water yielded by them to the other: in the fame folution boil another pound of the shreds, proceeding in the fame manner; and likewife a third and fourth pound. Whilft this is doing, dissolve a pound and a half of cuttle-fish bone in a pound of strong aquafortis in a glass receiver; adding more of the bone if it appear to produce any ebullition in the aquafortis: and pour this strained solution gradually into the other; but if any ebullition be occasioned, more of the cuttlefish bone must be dissolved as before, and added till no ebullition appears in the mixture. The crimfon fediment deposited by the liquor thus prepared is the lake: pour off the water; and ftir the lake in two gallons of hard spring water, and mix the sediment in two gallons of fresh water; let this method be repeated four or five times. If no hard water can be procured, or the lake appears too purple, half an ounce of alum should be added to each quantity of water before it be used. Having thus sufficiently freed the lake from the falts, drain off the water through a filtre, covered with a worn linen cloth. When it has been drained to a proper dryness, let it be dropped through a proper funnel on clean boards, and the drops will become fmall cones or pyramids, in which form the lake must be suffered to dry, and the preparation is completed.

Lake may be prepared from cochineal, by gently boiling two ounces of cochineal in a quart of water: filtering the folution through paper, and adding two ounces of pearl-ashes dissolved in half a pint of warm water and filtered through paper. Make a folution of cuttle-bone as in the former process; and to a pint of it add two ounces of alum diffolved in half a pint of water. Put this mixture gradually to that of the cochineal and pearl-ashes, as long as any ebullition appears to arise, and proceed as above .- A beautiful lake may be prepared from Brazil wood, by boiling three pounds of it for an hour in a folution of three pounds of common falt in three gallons of water, and filtering the hot fluid through paper; add to this a folution of five pounds of alum in three gallons of water. Diffolve three pounds of the best pearl-ashes in a gallon and a half of water, and purify it by filtertering; put this gradually to the other, till the whole of the colour appear to be precipitated, and the fluid be left clear and colourless. But if any appearance of purple be feen, add a fresh quantity of the solution of alum by degrees, till a fearlet hue be produced. Then purfue the directions given in the first process with regard to the fediment. If half a pound of feed lac be added to the folution of pearl ashes, and disfolved in it before its purification by the filtre, and two pounds of the wood, and a proportional quantity of the common talt and water be used in the coloured folution, a lake will be produced that will fland well in oil or water. but is not fo transparent in oil as without the feed-lac. The lake with Brafil wood may be also made by adding half an ounce of anotto to each pound of the wood; but the anotto must be dissolved in the solution of

Nº 173.

water or oil, though it diffolves entirely in spirit of wine, it is not of any use in our kinds of painting, This has been erroneously called fafflower.

Orange LAKE, is the tinging part of anotto precipitated together with the earth of alum. This pigment, which is of a bright orange colour and fit for varnish painting, where there is no fear of flying, and also for putting under crystal to imitate the vinegar garnet, may be prepared by boiling four ounces of the best anotto and one pound of pearl-ashes half an hour in a gallon of water; and straining the folution through paper. Mix gradually with this a folution of a pound and a half of alum in another gallon of water : defifting when no ebullition attends the commixture. Treat the fediment in the manner already directed for other kinds of lake, and dry it in square bits or round lozenges.

LAMA, a fynonyme of the camelus pacos. See

CAMELUS.

LAMA, the fovereign pontiff, or rather god, of the Afiatic Tartars, inhabiting the country of Barantola. The lama is not only adored by the inhabitants of the country, but also by the kings of Tartary, who fend him rich presents, and go in pilgrimage to pay him adoration, calling him lama congiu, i. e. "god, the everlasting father of heaven." He is never to be seen but in a fecret place of his palace, amidst a great number of lamps, fitting crofs-legged upon a cushion, and adorned all over with gold and precious stones; where at a distance they prostrate themselves before him, it not being lawful for any to kifs even his feet. He is called the great lama, or lama of lamas; that is, "priest of priests." The orthodox opinion is, that when the grand lama feems to die either of old age or infirmity. his foul in fact only quits a crazy habitation to look for - another younger or better; and it is discovered again in the body of some child, by certain tokens known only to the lamas or priefts, in which order he always appears.

The following account of the ceremonies attending the inauguration of the infant lama in Thibet is extracted from the first volume of the Afiatic Refearches.

The emperor of China appears on this occasion to have assumed a very conspicuous part in giving testimony of his respect and zeal for the great religious father of his faith. Early in the year 1784, he dismissed ambassadors from the court of Pekin to Teeshoo Loomboo, to represent their sovereign in supporting the dignity of the high prieft, and do honour to the occasion of the assumption of his office. Dalia Lama and the viceroy of Lassa, accompanied by all the court, one of the Chinese generals stationed at Lassa with a part of the troops under his command, two of the four magistrates of the city, the heads of every monastery throughout Thibet, and the emperor's ambassadors, appeared at Teeshoo Loomboo, to celebrate this epocha in their theological institut ons. The 28th day of the feventh moon, corresponding nearly, as their year commences with the vernal equinox, to the middle of October 1784, was chosen as the most auspicious for the ceemony of inauguration : a few days previous to which h e lama was conducted from Terpaling, the mona-Vol. IX. Part. II.

pearl-aftes. There is a kind of beautiful lake brought mark of pomp and homage that could be paid by an from China; but as it does not mix well with either enthufiaftic people. So great a concourse as affembled either from curiofity or devotion was never feen before, for not a person of any condition in Thibet was absent who could join the fuite. The procession was hence negestarily confirmined to move fo flow, that though Terpaling is fituated at the distance of 40 miles only from Teeshoo Loomboo, three days expired in the performance of this short march. The first halt was made at Tfondue; the fecond at Summaar, about fix miles off, whence the most splendid parade was referred for the lama's entry on the third day, the account of which is given by a person who was present in the procession. The road, he fays, was previously prepare red by being whitened with a wash, and having piles of stones heaped up with small intervals between on either side. The retinue passed between a double row of priefts who formed a ftreet extending all the way from Summaar to the gates of the palace. Some of the priefts held lighted rods of a perfumed composition that burn like decayed wood, and emit an aromatic fmoke : the rest were furnished with the different mufical instruments they use at their devotions, such as the gong, the cymbal, hautboy, trumpets, drums, and fea-shells, which were all founded in union with the hymn they chanted. The crowd of spectators were kept without the street, and none admitted on the high road but fuch as properly belonged to or had a prescribed place in the procession, which was arranged in the following order.

The van was led by three military commandants or governors of diffricts at the head of 6000 or 7000 horfemen armed with quivers, bows, and matchlocks. In their rear followed the ambassador with his suite, carrying his diploma as is the custom of China, made up in the form of a large tube, and fastened on his back. Next the Chinese general advanced with the troops under his command, mounted and accoutered after their way with fire-arms and fabres; then came a very numerous group bearing the various standards and infignia of state; next to them moved a full band of wind and other fonorous instruments; after which were led two horses richly caparifoned, each carrying two large circular stoves disposed like panniers across the horse's back and filled with burning aromatic woods. Thefe were followed by a fenior prieft, called a lama, who bore a box containing books of their form of prayer and some favourite idols. Next nine sumptuary horses were led loaded with the lama's apparel; after which came the priests immediately attached to the lama's person for the persormance of daily offices in the temple, amounting to about 700; following them were two men each carrying on his shoulder a large cylindrical gold infignium emboffed with emblematical figures (a gift from the emperor of China). The Duhunniers and Soopoons, who were employed in communicating addresses and distributing alms, immediately preceded the lama's bier, which was covered with a gaudy canopy, and borne by eight of the 16 Chinese appointed for this service. On one fide of the bier attended the regent, on the other the lama's father. It was followed by the heads of the different monasteries, and as the procession advanced, the priests who formed the ftreet fell in the rear and brought up the fuit. flery in which he had paffed his infancy, with every which moved at an extremely flow pace, and about

noon was received with in the confines of the monaftery, amidft an amazing difplay of colours, the acclamations of the crowd, folemn mufic, and the chanting of their

The lama being fafely lodged in the palace, the regent and Scopoon Choomboo went out, as is a cufto-mary compliment paid to vifitors of high rank on their near approach, to meet and conduct Dalai Lama and the viceroy of Laffa who were on the way to Tecfhoo Loomboo. Their retinues ensountered the following morning at the foot of Painom castle, and the next day together entered the monaltery of Tecfhoo Loomboo, in which both Dalai Lama and the viceroy were accommodated during their flaw.

The following morning, which was the third after Teefhoo Lama's arrival, he was carried to the great temple, and about noon feated upon the throne of his progenitors; at which time the emperor's ambaffador delivered his diploma, and placed the prefents with which he had been charged at the lama's feet.

The three next enfuing days, Dalai Lama met Teethoo Lama in the temple, where they were affilted by all the priests in the invocation and public worship of their gods. The rites then performed, completed, as we understand, the business of inauguration. During this interval all who were at the capital were entertained at the public expence, and alms were distributed without referve. In conformity likewife to previous notice circulated every where for the fame space of time, universal rejoicings prevailed throughout Thibet. Banners were unfurled on all their fortreffes, the peafantry filled up the day with mufic and festivity, and the night was celebrated by general illuminations. A long period was afterwards employed in making prefents and public entertainments to the newly inducted lama, who, at the time of his accession to the Musnud, or if we may use the term, pontificate of Teeshoo Loomboo, was not three years of age. The ceremony was begun by Dalai Lama, whose offerings are faid to have amounted to a greater value, and his public entertainments to have been more splendid than the rest. fecond day was dedicated to the viceroy of Lassa. The third to the Chinese general. Then followed the culbong or magistrates of Lassa, and the rest of the principal persons who had accompanied Dalai Lama. After which the regent of Teeshoo Loomboo, and all that were dependent on that government, were feverally admitted, according to pre-eminence of rank, to pay their tributes of obeisance and respect. As soon as the acknowledgements of all those were received who were admissible to the privilege, Teeshoo Lama made in the fame order fuitable returns to each, and the conformmation lafted 40 days.

Many importunities were used with Dalai Lama to prolong his itay at Teeshoo Loomboo; but he excused himself from encumbering the capital any longer with so numerous a concourse of people as attended on his movements, and deeming it expedient to make his absence as short as possible from the feat of his authority, at the expiration of 40 days he withdrew with all his shirte to Lassa, and the emperor's ambassador received his dismission to return to China, and thus terminated this formous sessions.

LAMB, in zoology, the young of the sheep kind.

A male lamb of the first year is called a wedder-bog, and the semale a ewe-bog y the second year it is called a wedder, and the semale speare. If a lamb be fick, mare's milk with water may be given it; and by blowing into the mouth, many have been recovered, after appearing dead. The best season of the many semale we have been recovered is when they are 16 or 18 weeks old; and about Michaelmas the males should be separated from the semales, and such males as are not designed for rams, gelded. "Lamb (says Dr Cullen) appears a more shrous kind of meat, and upon that account is less castly solutions. In Scotland, house-lamb is never reared to advantage."

Scythian LAMB, a kind of moss, which grows about the roots of fern in fome of the northern parts of Europe and Afia, and fometimes affumes the form of a quadruped; fo called from a supposed resemblance in shape to that animal. It has fomething like four feet, and its body is covered with a kind of down. Travellers report that it will fuffer no vegetable to grow within a certain distance of its feat. Sir Hans Sloan read a memoir upon this plant before the Society: for which those who think it worth while may consult their Transactions, No 245, p. 461. Mr Bell, in his " Account of a Journey from St Petersburgh to Ispahan," informs us that he fearched in vain for this plant in the neighbourhood of Astrachan, when at the same time the more fenfible and experienced among it the Tartars treated the whole history as fabulous. See Plate CCLIX.

LAMBECIUS (Peter), born at Hamburg in 1628, was one of the most learned men of his time. He went very young to fludy in foreign countries, at the expence of his uncle the learned Holstenius. He was chosen professor of history at Hamburg in 1652, and rector of the college of that city in 1660. He had taken his degree of doctor of law in France before. He fuffered a thousand vexations in his own country; because his enemies charged him with atheism, and cenfured his writings bitterly. He married a rich lady. but who was fo very covetous, that he left her in difgust within a fortnight. He went to Vienna, and from thence to Rome, where he publicly profesfed the Catholic religion. He returned to Vienna in 1662. where he was kindly received by the emperor, who appointed him his fublibrary keeper, and afterwards his principal librarian, with the title of counsellor and bistoriographer; in which employment he continued till his death, and gained a great reputation by the works he published, viz. 1. An Effay on Aulus Gellius. 2. The Antiquities of Hamburg. 3. Remarks on Godinus's Antiquities of Constantinople, &c.

LAMBERT of Aschaffenburg, a Benedictine monk, in the 11th century, wrote several works; among which is a history of Germany, from the year 1050 to 1077, which is esteemed.

LAMBERT (John), general of the parliament's forces in the civil wars of the laft century, was of a good family, and for fome time fludied the law in one of the inns of court; but upon the breaking out of the rebellion, went into the parliament-army, where he foonrofe to the rank of colonel, and by his conduct and valour performed many eminent fervices. But when Cromwell feemed inclined to affume the title of king, Lambert oppofed it with great vigour, and even refuficed to take the oath required by the affembly and enuced. Tembert, council to be faithful to the government; on which and acquired great skill in polite literature. He lived Lamech Lambin. Cromwell deprived him of his commission, but granted him a pension of 2000 l. a-year. This was an act of prudence rather than of generofity; as he well knew, that fuch genius as Lambert's, rendered desperate by poverty, was capable of attempting any thing.

Lambert being now divefted of all employment, retired to Wimbleton-house; where turning florist, he had the finest tulips and gillishowers that could be got for love or money. Yet amidit these amusements he fill nourished his ambition: for when Richard Cromwell succeeded his father, he acted so effectually with Fleetwood, Desborough, Vane, Berry, and others, that the new protector was obliged to furrender his authority; and the members of the long-parliament, who had continued fitting till the 20th of April 1653, when Oliver difmiffed them, were restored to their feats, and Lambert was immediately appointed one of the council of state, and colonel of a regiment of horse and another of foot. For this fervice the parliament presented him 10001 to buy a jewel; but he distributed it among his officers. This being soon known to the parliament, they concluded that he intended to fecure a party in the army. They therefore courteously invited him to come to London; but refolved, as foon as he should arrive, to secure him from doing any further harm. Lambert, apprehensive of this, delayed his return, and even refused to refign his commission when it was demanded of him and of eight of the other leading officers; and, marching up to London with his army, dislodged the parliament by force in October 1659. He was then appointed, by a council of the officers, major-general of the army, and one of the new council for the management of public affairs, and fent to command the forces in the north. But general Monk marching from Scotland into England to support the parliament, against which Lambert had acted with fuch violence, the latter, being deferted by his army, was obliged to submit to the parliament, and by their order was committed prisoner to the tower; whence escaping he soon appeared in arms with four troops under his command, but was defeated and taken prisoner by colonel Ingoldsby.

At the Refloration he was particularly excepted out of the act of indemnity. Being brought to his trial on the 4th of June 1662, for levying war against the king, this daring general behaved with more fubmission than the meanest of his fellow-prisoners, and was by his majefly's favour reprived at the bar, and confined during his life in the island of Guernsey.

LAMBERT (Anna Therefa de Marguenat de Courcelles, marchionefs of), an elegant moral writer, was the only daughter of Stephen Marguenat lord of Courcelles. In 1666 she married Henry de Lambert, who at his death was lieutenant-general of the army; and the afterwards remained a widow with a fon and a daughter, whom the educated with great care. Her house was a kind of academy, to which persons of diftinguished abilities regularly reforted. She died at Paris in 1733, aged 86. Her works, which are written with much tafte, judgment, and delicacy, are printed in two volumes. The advice of a mother to her fon and daughter are particularly effeemed

LAMBIN (Dennis), an eminent classical com-

for a long time at Rome; and at his return to Paris Lamentawas made royal professor of the Greek language. He died in 1572, aged 56, of pure grief at the death of his friend Ramus, who was murdered at the maffacee on St Bartholomew's day. He wrote commentaries on Plautus, Lucretius, Cicero, and Horace, and other works. His commentary on Horace is more particularly efteeme

LAMECH, of the race of Cain, was the fon of Methusael, and father of Jabal, Jubal, Tubal-cain, and Naamah. Gen. iv. 13, 19, 20, &c. Lamech is celebrated in scripture for his polygamy, whereof he is thought to be the first author in the world. He married Adah and Zillah. Adah was the mother of Jabal and Jubal; and Zillah of Tubal-cain, and Naamah his fifter. One day Lamech faid to his wives, " Hear me, ye wives of Lamech; I have flain a man to my wounding, and a young man to my hurt. If Cain shall be avenged seven fold, truly Lamech seventy and feven fold." These words are an unintelligible riddle. The reader may confult the commentators. There is a tradition among the Hebrews, that Lamech growing blind, ignorantly killed Cain, believing him to be some wild beaft; and that afterwards he slew his own fon Tubal cain, who had been the cause of this murder, because he had directed him to shoot at a certain place in the thickets where he had feen fomething ftir. See CAIN.

Several other suppositions are produced in order to explain this paffage concerning Lamech, and all almost

equally uncertain and abfurd.

LAMECH, the fon of Methuselah, and father of Noah. He lived a hundred fourfcore and two years before the birth of Noah, (Gen. v. 25, 31.); and after that, he lived five hundred and ninety-five years longer: thus the whole time of his life was feven hundred feventy-feven years, being born in the year of the world 874, and dying in the year of the world 1651.

LAMELLÆ, in natural history, denotes very thin plates, such as the scales of fishes are composed of.

LAMENTATIONS, a canonical book of the Old Testament, written by the prophet Jeremiah, according to archbishop Usher and some other learned menwho follow the opinion of Josephus and St Jerom, on occasion of Josiali's death. But this opinion does not feem to agree with the fubject of the book, the lamentation composed by Jeremiah on that occasion being probably loft. The fifty-fecond chapter of the book of Jeremiah was probably added by Ezra, as a preface or introduction to the Lamentations: the two first chapters are employed in describing the calamities of the fiege of Jerusalem: in the third the author deplores the perfecutions he himfelf had fuffered : the fourth treats of the defolation of the city and temple, and the misfortune of Zedekiah : the lifth chapter is a prayer for the Jews in their dispersion and captivity: and at the close of all he speaks of the cruelty of the Edomites, who had infulted Jerusalem in her mifery. All the chapters of this book, except the laft, are in metre, and digested in the order of the alphabet; with this difference, that in the first, second, and fourth chapters, the first letter of every verse follows the order of the alphabet; but in the third the mentator, was born at Montreuil fur-Mer, in Picardy, fame initial letter is continued for three verses toge-

Lamp.

Lamia ther. This order was probably adopted, that the book might be more easily learnt and retained. The subject of this book is of the most moving kind; and the ftyle throughout lively, pathetic, and affecting. ' In this kind of writing the prophet Jeremiah was a great mafter, according to the character which Grotius gives of him, Mirus in affectibus concitandis.

LAMIA (anc. geog.) a town of the Phthiotis, a district of Theffaly. Famous for giving name to the Bellum Lamiacum, waged by the Greeks on the Mace-

donians after Alexander's death.

LAMIACUM BELLUM happened after the death of Alexander, when the Greeks, and particularly the Athenians, incited by their orators, refolved to free Greece from the garrifons of the Macedonians. Leofthenes was appointed commander of a numerous force, and marched against Antipater, who then presided over Macedonia. Antipater entered Theffaly at the head of 13,000 foot and 600 horfe, and was beaten by the superior force of the Athenians and of their Greek confederates. Antipater after this blow fled to Lamia, where he refolved, with all the courage and fagacity of a careful general, to maintain a fiege with about 8000 or 9000 men that had escaped from the field of battle. Leofthenes, unable to take the city by ftorm, began to make a regular fiege. His operations were delayed by the frequent fallies of Aptipater; and Leosthenes being killed by the blow of a stone which he received. Antipater made his escape out of Lamia, and soon after, with the affiltance of the army of Craterus brought from Afia, he gave the Athenians battle near Cranon; and though only 500 of their men were flain, yet they became fo dispirited, that they sued for peace from the conqueror. Antipater at last with difficulty confented, provided they raifed taxes in the usual manner, received a Macedonian garrison, defrayed the expences of the war, and, laftly, delivered into his hands Demosthenes and Hyperides, the two orators whose prevailing eloquence had excited their countrymen against him. These disadvantageous terms were accepted by the Athenians, yet Demosthenes had time to escape and poison himself. Hyperides was carried before Antipater, who ordered his tongue to be cut off, and afterwards to be put to death.

LAMIÆ, a fort of demons who had their existence in the imaginations of the heathens, and were suppofed to devour children. Their form was human, refembling beautiful women. Horace makes mention of them in his Art of Poetry. The name, according to fome, is derived from lanio "to tear;" or according to others, is a corruption of a Hebrew word fignifying to devour. They are also called Larve or Lemu-

LAMINÆ. in physiology, thin plates, or tables, whereof any thing confilts; particularly the human skull, which are two, the one laid over the other.

LAMINIUM, (anc. geog.), a town of the Carpetani in the Hither Spain; at the diffance of feven miles from the head of the Anas or Guadiana: Now Montiel, a citadel of New Castile; and the territory called Ager Laminitanus, is now el Campo de Montiel, (Clufius.

LAMIUM, DEAD-Nettle, in botany: A genus of the gymnospermia order, belonging to the didynamia class of plants; and in the natural method ranking moithened from time to time with oil. Matth. xxv-

under the 42d order, Verticillata. The upper lip of Lammas the corolla is entire, arched, the under lip bilohous: the throat with a dent or tooth on each fide the margin. There are eight species; of which only two, viz. the album, white archangel or dead-nettle, and the purpureum or red archangel, deferve notice. The first grows frequently under hedges and in waste places ; the fecond is very common in gardens and corn-fields. The flowers of the first, which appear in April and May, have been particularly celebrated in uterine fluors and other female weaknesses, and also in disorders of the lungs; but they appear to be of very weak virtue; and they are at prefent fo little used in Britain as to have now no place in our pharmacopæias. The young leaves of both species are boiled and eaten in fome places like greens.

LAMMAS DAY, the first of August; so called, as fome will have it, because lambs then grow out of seafon, as being too big. Others derive it from a Saxon word, fignifying "loaf-mass," because on that day our forefathers made an offering of bread made with

new wheat.

On this day the tenants who formerly held lands of the cathedral church in York, were bound by their tenure to bring a lamb alive into the church at highmaís.

LAMOIGNON (Chretien Francis dc) marquis of Baville, and prefident of the parliament of Paris, was born in 1644. His father would not trust the education of his fon to another, but took it upon himfelf, and entered into the minutest particulars of his first studies: the love of letters and a folid taste were the fruits the scholar reaped from this valuable education. He learned rhetoric in the Jefuit's college, made the tour of England and Holland, and returned home the admiration of those meetings regularly held by perfons of the first merit at his father's house. The feveral branches of literature were however only his amusement: the law was his real employ; and the eloquence of the bar at Paris owes its reformation from bombail and affected erudition to the plain and noble pleadings of M. Lamoignon. He was appointed the king's advocate general in 1673; which he discharged until 1698, when the prefidentship of the parliament was conferred on him. This post he held nine years, when he was allowed to refign in favour of his eldest fon: he was chofen prefident of the royal academy of infcriptions in 1705. The only work he fuffered to fee the light was his Pleader, which is a monument of his eloquence and inclination to polite letters. He died in 1700.

LAMP, a veffel containing oil, with a lighted wick. Lamps were in general use amongst the Jews, Greeks, and Romans. The candleftick with feven branches, placed in the fanctuary by Mofes, and those which Solomon afterwards prepared for the temple, were crystal lamps filled with oil, and fixed upon the branches. The lamps or candlefticks made use of by the Jews in their own houses were generally put into a very high stand on the ground. The lamps supposed to be used by the foolith virgins, &c. in the gospel, were of a different kind -According to critics and antiquaries, they were a fort of torches, made of iron or potter's earth, wrapped about with old linen, and

kind. The use of wax was not unknown to the Romans, but they generally burnt lamps; hence the proverb Tempus et oleum perdidi, " I have lost my labour." Lamps were fometimes burnt in honour of the dead,

both by Greeks and Romans.

Dr St Clair, in the Philof. Tranf. no 245, gives the description of an improvement on the common lamp. He proposes that it should be made two or three inches deep, with a pipe coming from the bottom almost as high as the top of the veffel. Let it be filled fo high with water that it may cover the hole of the pipe at the bottom, that the oil may not get in at the pipe and fo be lott. Then let the oil be poured in fo as to fill the veffel almost brim-full; and to the veffel must be adapted a cover having as many holes as there are to be wicks. When the veffel is filled and the wicks lighted, if water falls in by drops at the pipe, it will always keep the oil at the fame height or very near it : the weight of the water being to that of the oil as 20 to 10, which in two or three inches makes no great difference. If the water runs fafter than the oil waltes, it will only run over at the top of the pipe, and what does not run over will come under the oil, and keep it at the fame height.

From experiments made in order to ascertain the expence of burning chamber oil in lamps, it appears, that a taper lamp, with eight threads of cotton in the wick, confumes in one hour 325 oz. of spermaceti oil, at 28. 6d. per gallon; fo that the expence of burning 12 hours is 4.57 farthings. This lamp gives as good a light as the candles of eight and ten in the pound ; it feldom wants fnuffing, and cafts a ftrong and fleady light. A taper, chamber, or watch lamp, with four ordinary threads of cotton in the wick, confumes e. 1664 oz. of spermaceti oil in one hour; the oil at 2s. 6d. per gallon, makes the expence of burning 12

hours only 2 34 faithings.

Perpetual Lamps. The testimonies of Pliny, St Authin, and others, have led many to believe that the ancients had the invention of perpetual lamps; and fome moderns have attempted to find out the fecret, but hitherto in vain. Indeed it feems no easy matter to find out either a perpetual wick or a perpetual oil. The curious may read Dr Plot's conjectures on the fubiect in the Philof. Tranf. nº 166 : or in Lowthorp's abridgment, vol. iii. p. 636. But few, we believe, will give themselves the trouble of searching for the fecret, when they confider that the credulity of Pliny and of St Auftin was fuch, that their teftimony does not feem a fufficient inducement to us to believe that a lamp was ever formed to burn 1500 or 1000 years: much less is it credible that the ancients had the secret of making one burn for ever.

Rolling LAMP: A machine A B, with two moveable circles DE, FG, within it; whose common centre of motion and gravity is at K, where their axes of motion cross one another. If the lamp K C, made pretty heavy and moveable about its axis HI, and whose centre of gravity is at C, be fitted within the inner circle, the common centre of gravity of the whole machine will fall between K and C; and by reason of the pivots A, B, D, E, H, I, will be always at liberty to defcend: hence, though the whole machine be rolled a-

Lamp. 1. 2. The lamps of Gideon's foldiers were of the fame long the ground, or moved in any manner, the flame Lamp. will always be uppermost, and the oil cannot foill.

It is in this manner they hang the compass at fea; and thus should all the moon-lanterns be made, that are carried before coaches, chaifes, and the like.

Argand's LAMP. This is a very ingenious contrivance, and the greatest improvement in lamps that has yet been made. It is the invention of a citizen of Geneva; and the principle on which the superiority of the lamp depends, is the admission of a larger quantity of air to the flame than can be done in the common way. This is accomplished by making the wick of a circular form; by which means a current of air rushes through the cylinder on which it is placed with great force; and, along with that which has access to the outfide, excites the flame to fuch a degree that the fmoke is entirely confumed. Thus both the light and heat are prodigiously increased, at the same time. that there is a very confiderable faving in the expence of oil, the confumption of the phlogiston being exceedingly augmented by the quantity of air admitted to the flame; fo that what in common lamps is diffipated in smoke is here converted into a brilliant flame.

This lamp is now very much in use; and is applied not only to the ordinary purposes of illumination, but also to that of a lamp furnace for chemical operations, in which it is found to exceed every other contrivance yet invented. It confils of two parts, viz. a refervoir for the oil, and the lamp itself. The refervoir is usually. in the form of a vafe, and has the lamp proceeding from its fide. The latter confifts of an upright metallie tube about one inch and fix-tenths in diameterthree inches in length, and open at both ends. Within this is another tube about an inch in diameter, and nearly of an equal length; the space betwixt the two being left clear for the paffage of the air. 'The internal tube is closed at the bottom, and contains another fimilar tube about half an inch in diameter, which is foldered to the bottom of the fecond. It is perforated throughout, fo as to admit a current of air to pafer through it; and the oil is contained in the space betwixt the tube and that which furrounds it. A particular kind of cotton cloth is used for the wick, the longitudinal threads of which are much thicker than the others, and which nearly fills the space into which the oil flows; and the mechanism of the lamp is such. that the wick may be raifed or depressed at pleasure. When the lamp is lighted, the stame is in the form of a hollow cylinder; and by reason of the strong influx of air through the heated metallic tube, becomes extremely bright, the fmoke being entirely confumed for the reasons already mentioned. The heat and light are still farther increased, by putting over the whole a glass cylinder nearly of the fize of the exterior tube. By diminishing the central aperture, the heat and light are proportionably diminished, and the lamp begins to fmoke. The access of air both to the external and internal furfaces of the flame is indeed fo very necessary, that a sensible difference is perceived when the hand is held even at the distance of an inch below the lower aperture of the cylinder; and there is also a certain length of wick at which the effect of the lamp is ftrongest. If the wick be very fhort, the flame, tho' white and brilliant, emits a difagreeable and pale kind

€CLIX.

brown, and smoke is emitted. The faving of expence in the use of this instrument for common purposes is very considerable. By some experiments it appears that the lamp will continue to burn three hours for the value of one penny; and the following was the refult of the comparison between the light emitted by it and that of a candle. The latter having been fuffered to burn fo long without fnuffing, that large lumps of coally matter were formed mon the wick, gave a light at 24 inches diffance equal to the lamp at 120 inches; whence it appeared that the light of the lamp was equal to 28 candles in this state. On fnuffing the candle, however, its light was fo much augmented, that it became necessary to remove it to the distance of 67 inches before its light became equal to that of the lamp at 120 inches; whence it was concluded that the light of the lamp was fomewhat less than that of four candles fresh snuffed. At another trial, in which the lamp was placed at the diftance of 131 inches, and a candle at the distance of 55 inches, the lights were equal. In these experiments the candles made use of were 103 inches long, and 210 inches in diameter. When the candle was newly fnuffed, it appeared to have the advantage; but the lamp foon got the superiority; and on the whole it was concluded, that the lamp is at least equivalent to half a dozen of tallow candles of fix in the pound; the ex-

The best method of comparing the two lights together feems to be the following. Place the greater light at a confiderable distance from a white paper, the fmaller one being brought nearer or removed farther off as occasion requires. If an angular body be held before the paper, it will project two shadows: these two fladows can coincide only in part; and their angular extremities will, in all politions but one, be at fome distance from each other; and being made to coincide in a certain part of their bulk, they will be bordered by a lighter shadow, occasioned by the exclution of the light from each of the two luminous bodies respectively. These lighter shadows, in fact, are fpaces of the white paper illuminated by the different luminous bodies, and may eafily be compared together, because at a certain point they actually touch one another. If the space illuminated by the smaller light appear brightest, the light must be removed farther off,

pence of the one being only two pence halfpenny, and

the other eight pence in feven hours.

but the contrary if it appear more obscure. On cutting open one of Argand's wicks longitudinally, and thus reducing the circular flame to a ftraight lined one, the lights appeared quite equal in power; but the circular one had by far the greatest effect in dazzling the eyes; though when the long flame was made to shine on the paper, not by the broadfide, but in the direction of its length, it appeared more dazzling than the other. On placing this long flame at right angles to the ray of Argand's lamp, it projected no shadow; but when its length was placed in the direction of the ray, it. gave a shadow bordered with two

broad, well defined, and bright lines.

The broad wicked lamp feems to have the advantage of the other, as requiring less apparatus; and indeed by this contrivance we may at the most trisling expence have a lamp capable of giving any degree of light we

Mamp. of light; and if very long, the upper part becomes pleafe. The only disadvantage attending either the Lampadary one or the other is, that they cannot easily be carried from one place to another; and in this respect it does Lampyris, not feem possible by any means to bring lamps to an equality with candles.

LAMP Black, among colourmen. See Colour-Making, no 18, 19 .- Substances painted with lamp-black and oil, are found to relift the effects of electricity to a fuprifing degree; fo that in many cases even lightning itself seems to have been repelled by them. See LIGHTNING: THUNDER; CHEMISTRY, nº 700, and ELECTRICITY, p. 478. col. 1.

LAMPADARY, an officer in the ancient church of Constantinople, so called from his employment, which was to take care of the lamps, and to carry a taper before the emperor or patriarch when they went

to church or in procession.

LAMPAS, in farriery. See there, f xxxv.

LAMPREY. See PETROMYZON.

LAMPRIDIUS (Ælius), a Latin historian, who lived under the emperors Dioclefian and Constantine the Great. We have, of his writing, the lives of four emperors, Antoninus, Commodus, Diadumenus, and Heliogabalus. Some attribute the life of Alexander Severus to him; but the MS. in the palatine library ascribes it to Spartian.

LAMPRIDIUS (Benedict), of Cremona, a celebrated Latin poet of the 6th century. He taught Greek and Latin at Rome and at Padua, until he was invited to Mantua by Frederic Gonzaga to undertake the tuition of his fon. We have epigrams and lyric verses of this writer, both in Greek and Latin, which were printed feparately, as well as among the Delicia of the Italian poets.

LAMPSACUS, or I.AMPSACUM, (anc. geog.), a confiderable city of Myfia; more anciently called Pilyeas (Homer), because abounding in pine trees, a circumflance confirmed by Pliny ; fituated at the north end or entrance of the Hellespont into the Propontis, with a commodious harbour, opposite to Callipolis in the Thracian Chersonesus. It was assigned by Artaxerxes to Themistocles, for furnishing his table with wine, in which the country abounded. It was faved from the ruin threatened by Alexander because in the interest of Persia, by the address of Anaximenes the historian, fent by his fellow-citizens to avert the king's difpleafure; who hearing of it, folemnly declared he would do the very reverse of Anaximenes's request, who therefore begged the king utterly to deftroy it, which he could not do because of his oath. Lampfacius the enither, denoting lascious, the character of the people : Still called Lampfacus. E. Long. 280. N. Lat. 40, 12.

LAMPYRIS, the FIRE-FLY, a genus of infects belonging to the coleoptera order; the characters of which are: The antennæ are filiform; the elytra are flexible; the thorax is flat, of a femiorbicular form, furrounding and concealing the head. The fegments of the abdomen terminate in papillæ, which are turned up towards the elytra, and partly fold one over the other. The females in general are apterous.

There are 18 species; of which the most remarkable is the noctiluca. The male of this infect is less than the female: its head is shaped exactly in the same manner, and covered likewife by the plate of the thorax, only it appears rather longer than that of the fe- CCLVIII

Lancarim.

Barbut an

thorax of the male, which is fmaller and shorter than that of the female, has the folds and papillæ on its fides much lefs remarkable ; but the greatest difference that is found between the two fexes is, that the male is covered with brown elytra, shagreened and marked with two lines longitudinally. The elytra are longer than the abdomen, and under them lie the wings. The two last rings of the abdomen are not fo bright as those of the female, only there appear four luminous points, two upon each of the two last rings.

ly met with towards evening, in the month of June, in woods and meadows, is the female belonging to this fpecies. By the fhining light which it emits, it attracts the male; a wonderful instance of the divine providence. It is apparent that their shining light depends on a liquor placed at the lower extremity of the infect, which when in motion, the light is more lively and shining, and of a finer green. This light the infect withdraws at pleafure, either by unfolding or contracting itself. As a proof that the light depends on a phosphorous matter, you may crush the animal, which, though dead and bruifed, leaves a luminous fubstance on the hand, that only lofes its lustre when dried.

The perfect infect flies about during the evening in autumn, and frequents the graffy plantations of juniper trees.

LAMY, or LAMI, (Bernard), was born at Mons in 1640, and studied there under the fathers of the oratory; with whose way of life he was fo pleased, that he went to Paris in 1658, and entered into the institution. He had a great taste for the sciences, and fludied them all; he entered into the pricfthood in 1667, and taught philofophy at Saumur and Angiers; which latter place he was obliged to quit by an order procured from court for adopting the new philosophy instead of that of Aristotle. In 1676 he went to Grenoble, where cardinal Camus was then bishop; who conceived fuch an effect for him, that he retained him near his perfon, and derived confiderable fervices from him in the government of his diocese. After continuing many years there, he went to refide at Rouen, where he died in 1715. He wrote feveral scientifical works, besides others in divinity,

LANCARIM SPRING, the name of a medicated water of Glamorganshire. It has its name from a town near which it rifes; and has been very long famous in the place for the cure of the king's evil. The body of water is about an ell broad, and runs between two hills covered with wood. About 12 yards from this fpring the rill falls from a rock of about eight or nine feet high, with a confiderable noise. The fpring is very clear, and rifes out of a pure white marle. The cures that have been performed there, are proofs of a real power in the water; but there is some question whether the water, or its motion and coldness, does the good; for the people who come for relief always drink of the fpring, and bathe the part afterward in the fall below. It is generally supposed that the limestone rocks communicate a virtue to it by which it cures internally; but it has been often found, that the holding a limb difordered with the evil in the ftrong

Rampyris male. Both the head and antennæ are black. The current of a mill tail has cured it, and there is the Lanzashire. fame advantage in the fall of this water.

LANCASHIRE, a large maritime province of England, washed by the Irish sea on the west, bordering on the north with part of Cumberland and Weltmoreland : bounded on the east by the West Riding of Yorkshire, and on the west by Cheshire; extending 73 miles in length and 41 in breadth, comprehending 6 hundreds, 63 parishes, 27 market-towns, 304 villages, about 43,000 houses, and about 260,000 inhabitants.

The castern parts of the province are rocky, and in The infect called glosv-worm, and which is frequent- the northern diffricts we fee many fingle mountains remarkably high, fuch as Ingleborough hill, Cloughbohill, Pendle hill, and Longridge-hill. Nor is there any want of wood in this country, either for timber or fuel; witness Wiersdale forest and Bowland forest to the northward, and Simon's wood in the fouthern part of Lancashire.

This country is well watered with rivers and lakes. Among the lakes or meres of Lancashire, we reckon the Winander-mere, and the Kiningston-mere, which, though neither fo large nor fo well flored with fifth, vet affords plenty of excellent char. There was on the fouth fide of the Ribble another lake called Martons feveral miles in circumference, which is now drained, and converted into pasture ground. In this operation, the workmen found a great quantity of fish, together with eight canoes, refembling those of America, fupposed to have been used by the ancient British fishermen. Befides thefe meres or lakes, this county abounds with moraffes and moffes, from which the inhabitants dig excellent peat or turf for fuel, as well as marle for manuring the ground, and trunks of old fir-trees, supposed to have lain there since the general deluge. Some of these are so impregnated with turpentine, that when divided into fplinters, they burn like candles, and are used for that purpose by the common people. There is a great variety of mineral waters in this county, fome periodical fprings, and one inftance of a violent eruption of water at Kirky in Fourness. The most remarkable chalybeate spaws are those of Latham. Wigan, Stockport, Burnley, Bolton, Plumpton, Middleton, Strangeways, Lancaster, Larbrick, and Chorly. At Aneliff, in the neighbourhood of Wigan, is a fountain called the Burning Well, from whence a bituminous vapour exhales, which being fet on fire by a candle burns like brandy, fo as to produce a heat that will boil eggs to a hard confiftence, while the water itself retains its original coldness*. There is at Barton * See Burns! a fountain of falt-water, fo firongly impregnated with ing Well. the mineral, as to yield fix times as much as can be extracted from the fame quantity of fea-water. At Rogham, in Fourness, there is a purging saline fountain; and in the neighbourhood of Rassal, where the ground is frequently overflowed by the fea, a stream defcends

from Hagbur hills, which in the space of feven years is faid to convert the marle into a hard freestone fit for building. The air of Lancashire is pure, healthy, and agreeable, except among the fens and on the fea-shore. where the atmosphere is loaded with putrid exhalations, producing malignant and intermitting fevers, fcurvy, rheumatism, dropfy, and confumption. The foil is various in different parts of the county, poor and rocky on the hills, fat and fertile in the valleva-

Lancathire and champaign country. The colour of the peat is ears are faluted by the fongs of merriment from either Lancathir white, grey, or black, according to the nature of the fex, who thus beguile their labours in the mine. You Lancaster. composition and the degree of putrefaction which the have no sooner reached the head of the works, than a ingredients have undergone. There is a bituminous new scene opens to your view. There you behold men earth about Ormskirk, that fmells like the oil of amber, and indeed yields an oil of the fame nature, both in its fcent and medicinal effects, which moreover reduces raw fiesh to the consistence of mummy; this earth burns like a torch, and is used as such by the country people. The metals and minerals of this county confift of lead, iron, copper, antimony, black lead, lapis calaminaris, spar, green vitriol, alum, sulphur,

pyrites, freeltone, and pit and cannel coal. The level country produces plenty of wheat and barley, and the skirts of the hills yield good harvelts of excellent oats: very good hemp is raifed in divers parts of the province; and the pasture which grows in the valley is fo peculiarly rich, that the cattle which feed upon it are much larger and fatter than in any other part of England. There is not any part of the world better fupplied than Lancashire with provisions of all kinds at a very reasonable rate; such as beef, veal, mutton, lamb, pork, poultry, and game of all forts, caught upon the moors, heaths, and commons, in the hilly part of the faire. Besides the sea-fowl common to the shires of England, such as ducks, easterlings, teal, and plover, many uncommon birds are observed on the coast of Lancashire, the sea-crow, variegated with blue and black, the puffin, the cormorant, the curlew, the razor bill, the copped wren, the Edward III. who conferred it as an appendage on his fon red-fhanks, the fwan, the tropic bird, the king's-

fifher, &c. The chief manufactures of this county are woollen and cotton cloths of various kinds, tickings, and cotton velvets, for which Manchester is particularly famous. The principal rivers are the Merfey, which parts Cheshire and this county; and the Ribble, which rifes in Yorkshire, and enters this county at Clithero, running fouth west by Preston into the Irish sea. Befides thefe there are many leffer streams. The navigation made by his grace the duke of Bridgewater in this county, is highly worthy of notice. This was begun so lately as about 20 years ago; it bears vessels of 60 tens burden, and is carried over two rivers, the Merfey and the Irwell. The fough, or adit, which was necessary to be made, in order to drain the water from the coal mines, is rendered navigable for boats of 6 or 7 tons burden, and forms a kind of subterraneous river, which runs about a mile and a half under ground, and communicates with the canal. I his river leads to the head of the mines, is arched over with brick, and is just wide enough for the passages of the boats : at the mouth of it are two folding doors, which are closed as foon as you enter, and you then proceed by candle-light, which casts a livid gloom, ferving only to make darkness visible. But this difmal gloom is rendered till more awful by the folemn echo of this fubterraneous water, which returns various and difcordant founds. One while you are struck with the grating noise of engines, which by a curious contrivance let down the coals into the boats; then again you hear

No 173.

new scene opens to your view. There you behold men and women almost in the primitive state of nature, toiling in different capacities, by the glimmering of a dim taper, fome digging coal out of the bowels of the earth; fome again loading it in little waggons made for the purpose; others drawing those waggons to the boats. To perfect this canal, without impeding the public roads, bridges are built over it, and where the earth has been raifed to preferve the level, arches are formed under it: but what principally strikes every beholder, is a work raifed near Barton-bridge, to convey the canal over the river Merfey. This is done by means of three stone arches, fo spacious and lofty as to admit veffels failing through them; and indeed nothing can be more fingular and pleafing, than to obferve large veffels in full fail under the aqueduct, and at the same time the duke of Bridgewater's vessels failing over all, near fifty feet above the navigable river. By this inland navigation communication has been made with the rivers Mersey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles in the counties of Lincoln, Nottingham, York, Lancaster, Westmoreland, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c.

Lancashire was erected into a county-palatine by John of Ghaunt, thence called duke of Lancaster : but the duchy contained lands that are not in Lancashire, and among other demesnes, the palace of the Savoy. and all that diffrict in London, which indeed belong to it at this day. The revenues of this duchy are administered by a court which sits at Westminster, and a chancery court at Preston, which has a feal distinct from that of the county-palatine. The title of Lancafter diffinguished the posterity of John of Ghaunt from those of his brother, who succeeded to the duchy of York, in their long and bloody contest for the crown of England .- Lancashire sends two members to parliament for the county; and 12 for the fix boroughs of Lancaster, Preston, Newton, Wigan, Clitheroe, and Liverpool.

LANCASTER, the capital of the county of Lancashire in England, is pleafantly situated on the fouth fide of the river Lun, over which there is a handsome flone-bridge. It is an ancient town, and is supposed to have been the Longovicum of the Romans. King John confirmed to the burgeffes all the liberties he had granted to those of Bristol; and Edward III. granted that pleas and fessions should be held here, and no where elfe in the county. It is governed by a mayor, recorder, 7 aldermen, 2 bailiffs, 12 capital burgeffes, 12 common burgeffes, a town-clerk, and 2 ferjeants at mace. The affizes are held in the caftle, where is also the county gaol. It trades to America with hardware and woollen manufactures in veffels of 70 tons. There is a market on Wednesday by grant, and another on Saturday by prescription, besides one every the shock of an explosion, occasioned by the blowing other Wednesday throughout the year for cattle; and up the hard rock, which will not yield to any other three fairs, in May, July, and October. The cattle is force than that of gunpowder; the next minute your not large, but neat and flrong. Not very long ago, Lance in digging a cellar, there were found feveral Roman to the water, on the opposite sides of her keel, to Lanch

Roman emperors; fo that it is supposed there was here clivity are placed two corresponding ranges of planks. a Roman fortress. On the top of the castle is a square tower, called John of Gaunt's chair, whence there is a charming prospect of the adjacent country, and especially towards the fea, where is an extensive view even to the Isle of Man. There is but one church, a fine Gothic building. It is placed on the fame elevation, and from fome points of view forms one group, with the caftle, which gives the mind a most magnificent idea of this important place. The late confiderable additional new streets and a new chapel, with other improvements, give an air of elegance and prosperity to the town; and the new bridge of 5 equal elliptical arches, in all 549 feet in length, adds not a little to the embellishments and conveniency of the place. Adjoining to the caftle, the new gaol is erected on an improved plan. On the fide of the hill below it, hangs a piece of a Roman wall, called Wery-wall. Here is a custom-house. By the late inland navigation, it has communication with the rivers Merfey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c. which navigation, including its windings, extend above 500 miles in the counties of Lincoln, Nottingham, York, Westmoreland, Chefter, Stafford, Warwick, Leicester, Oxford, Worcefter, &c. For its peculiar government, fee Duchr-Court.

LANCE, LANCEA, a spear; an offensive weapon worn by the ancient cavaliers, in form of a half pike. The lance confifted of three parts, the shaft or handle, the wings, and the dart. Pliny attributes the invention of lances to the Ætolians. But Varro and Aulus Gellius fay the word lance is Spanish; whence others conclude the use of this weapon was borrowed by the people of Italy from the Spaniards. Diodorus Siculus derives it from the Gaulish, and Festus from the Greek

λογχ», which fignifies the fame.

LANCE, in ichthyology. See Ammodytes.

LANCEOLATED LEAF. See BOTANY, p. 442. LANCET, a chirurgical instrument, sharp-pointed and two-edged, chiefly used for opening veins in the operation of phlebotomy or bleeding; also for laying

open abscesses, tumors, &c. LANCH, a peculiar fort of long boat, used by the French, Spanish, and Italian shipping, and in general by those of other European nations when employed

in voyaging in the Mediterranean fea.

A lanch is proportionably longer, lower, and more flat bottomed than the long boat; it is by confequence less fit for failing, but better calculated for rowing and approaching a flat shore. Its principal fuperiority to the long-boat, however, confilts in being by its conftruction much fitter to under-run the cable : which is a very necessary employment in the harbours of the Levant fea, where the cables of different ships are fastened across each other, and frequently render this exercife extremely necessary.

LANCH, is also the movement by which a ship or boat descends from the shore, either when she is at first

built, or at any time afterwards.

To facilitate the operation of lanching, and prevent any interruption therein, the ship is supported by two firong platforms, laid with a gradual inclination Vol. IX. Part II.

utenfils and veffels for facrifices, as also the coins of which they are parallel. Upon the surface of this dewhich compose the base of a frame called the cradle, whose upper part envelopes the ship's bottom, whereto it is securely attached. Thus the lower surface of the cradle, conforming exactly to that of the frame below. lies flat upon it lengthwife, under the opposite sides of the fhip's bottom; and as the former is intended to flide downwards upon the latter, carrying the ship along with it, the planes or faces of both are well daubed with foap and tallow.

The necessary preparations for the lanch being made. all the blocks and wedges, by which the ship was formerly supported, are driven out from under her keel. till her whole weight gradually fubfides upon the platforms above described, which are accordingly called the ways. The shores and stanchions, by which she is retained upon the stocks till the period approaches for lanching, are at length cut away, and the fcrews applied to move her if necessary. The motion usually begins on the instant when the shores are cut, and the ship slides downward along the ways, which are generally prolonged under the furface of the water, to a fufficient depth to float her as foon as fhe arrives at the farthest end thereof.

When a ship is to be lanched, the ensign, jack, and pendant, are always hoifted, the last being displayed from a staff erected in the middle of the ship

Ships of the first rate are commonly constructed in dry docks, and afterwards floated out, by throwing open the flood gates, and fuffering the tide to enter as

foon as they are finished. LANCEROTA, one of the Canary islands, fubject to Spain, and fituated in W. Long. 13. 5. N. Lat. 28. 40. It is about 32 miles in length and 22 in breadth. The ancient inhabitants were negroes, very strong, active, and swift of foot. There is a ridge of hills runs quite through it, on which are fed a good number of sheep and goats. They have but few black cattle, still fewer camels, and a very few small horses, The valleys are dry and fandy, yet they produce a fmall quantity of wheat and barley. This island was first discovered in 1417. In 1596 it was taken by the English under the command of the earl of Cumberland; after which it was better fortified than before, There is in this island a city called also Lancerota, which, at the time the earl of Cumberland was there, confilled only of about 100 houses, all poor buildings, generally of one flory, and covered with reeds or flraw laid upon a few rafters, and over all a coat of dirt hardened by the fun. There was also a church which had no windows in it, and was fupplied with light only by the door.

LANCIANO, a confiderable town of Italy, in the kingdom of Naples, and in the Hither Abruzzo, with an archbishop's see; famous for its fairs, which are held in July and August. It is feated on the river Feltrino near that of Sangor. E. Long. 15. 5. N.

LANCISI (John Marca), an eminent Italian phyfician, was born at Rome in 1654. From his earliest years he had a turn to natural history; and fludied botany, chemistry, anatomy, and medicine, with great vigour. In 1688 Pope Innocent XI. appointed him

Lancet his physician and private chamberlain, notwithstanding are said to have been first granted under Henry II. Land. his youth; and cardinal Altieri Camerlinga made him his vicar for the installation of doctors in physic, which fades to introduce this new taxation, in order to de-Pope Clement XI, gave him as long as he lived, as well as continued to him the appointments conferred on him by his predecessor. He died in 1710, after giving his fine library of more than 20,000 volumes to the hospital of the Holy Ghost for the use of the public. This noble benefaction was opened in 1716, in the presence of the pope and most of the cardinals. He wrote many works which are esteemed, the principal of which were collected together, and printed at Geneva in 1718, in two volumes quarto.

LANCRET (Nicholas), a French painter, born at Paris in 1690. He was the disciple of Watteau and Gillot, and painted conversations. He was indefatigable in his profession, executed with great truth after Nature, grouped his figures well, and handled a light pencil. He died in 1743. LANCRINCK (Profper Henry), a painter of con-

fiderable note, born in 1628, and educated in the school at Antwerp. He studied principally after Titian and Salvator Rofa; and met with encouragement in England fuitable to his merit. His landscapes show a good invention, good colouring, and harmony: they are chiefly of rough rude country, with broken ground and uncommon scenery. He gave way too much to pleasure, and died in 1692.

LAND, in a general fenfe, denotes terra firma, as

diftinguished from fea.

LAND, in a limited fense, denotes arable ground.

See AGRICULTURE.

LAND, in the fea-language, makes part of feveral compound terms; thus, land-laid, or, to lay the land, is just to lose fight of it. Land-locked, is when land lies all round the ship, so that no point of the compass is open to the sea. If she is at anchor in such a place, the is faid to ride land-locked, and is therefore concluded to ride fafe from the violence of the winds and tides. Land mark, any mountain, rock, fleeple, tree, &c. that may ferve to make the land known at fea. Land is flut in, a term used to fignify that another point of land hinders the fight of that from which the ship came. Land-to, or the ship lies landto; that is, she is so far from shore, that it can only just be discerned. Land-turn is a wind that in almost all hot countries blows at certain times from the shore in the night. To fet the land; that is, to fee by the compass how it bears.

LAND-Tax, one of the annual taxes raifed upon the

fubject. See Tax.

The land tax, in its modern shape, has superfeded all the former methods of rating either property or persons in respect of their property, whether by tenths or fifteenths, fubfidies on land, hydages, fcutages, or talliages; a short explication of which will, however, greatly affift us in understanding our ancient laws and

Tenths and fifteenths were temporary aids iffuing out of personal property, and granted to the king by parliament. They were formerly the real tenth or

who took advantage of the fashionable zeal for croifray the expence of a pious expedition to Palestine, which he really or feemingly had projected against Saladine emperor of the Saracens, whence it was originally denominated the Saladine tenth. But afterwards fifteenths were more usually granted than tenths. Originally the amount of these taxes was uncertain, being levied by affeffments new-made at every fresh grant of the commons, a commission for which is preferved by Matthew Paris: but it was at length reduced to a certainty in the eighth year of Edward III. when, by virtue of the king's commission, new taxations were made of every township, borough, and city in the kingdom, and recorded in the exchequer; which rate was, at the time, the fifteenth part of the value of every township, the whole amounting to about 29,000l. and therefore it still kept up the name of a fifteenth, when, by the alteration of the value of money and the increase of personal property, things came to be in a very different fituation. So that when, of later years, the commons granted the king a fifteenth, every parish in England immediately knew their proportion of it : that is, the fame identical fum that was affelfed by the same aid in the eighth of Edward III.; and then raifed it by a rate among themselves, and returned it into the royal exchequer.

The other ancient levies were in the nature of a modern land-tax: for we may trace up the original of that charge as high as to the introduction of our military tenures; when every tenant of a knight's fee was bound, if called upon, to attend the king in his army for 40 days in every year. But this perfonal attendance growing troublesome in many respects, the tenants found means of compounding for it, by first fending others in their stead, and in process of time by making a pecuniary fatisfaction to the crown in lieu of it. This pecuniary fatisfaction at last came to be levied by affeffments, at fo much for every knight's fee, under the name of scutages; which appear to have been levied for the first time in the fifth year of Henry II. on account of his expedition to Touloufe, and were then (Sir Wm. Blackstone apprehends) mere arbitrary compositions, as the king and the subject could agree. But this precedent being afterwards abused into a means of oppression (by levying scutages on the landholders by the king's authority only, whenever our kings went to war, in order to hire mercenary troops and pay their contingent expences), it became thereupon a matter of national complaint; and King John was obliged to promife in his magna carta, that no scutage should be imposed without the consent of

the common council of the realm.

Of the same nature with scutages upon knights-fees were the affeffments of hydage upon all other lands, and of talliage upon cities and burghs. But they all gradually fell into difuse, upon the introduction of subfidies, about the time of King Richard II. and King Henry IV. These were a tax, not immediately imposed upon property, but upon persons in respect of fifteenth part of all the moveables belonging to the their reputed effaces, after the nominal rate of 4.s. in subject; when such moveables, or personal estates, the pound for lands, and 2 s. 6d. for goods; and for were a very different and a much less confiderable those of aliens in a double proportion. But this affessthing than what they usually are at this day. Tenths ment was also made according to an ancient valuation;

wherein

Land, wherein the computation was fo very moderate, and the by the temporality and four by the clergy; and in Land. rental of the kingdom was supposed to be so exceeding low, that one subsidy of this fort did not, according to Sir Edward Coke, amount to more than 70,000l. whereas a modern land tax at the fame rate produces two millions. It was anciently the rule never to grant more than one subsidy and two sifteenths at a time: but this rule was broke through for the first time on a very preffing occasion, the Spanish invasion in 1588; when the parliament gave Queen Elizabeth two fubfidies and four fifteenths. Afterwards, as money funk in value, more subsidies were given; and we have an inflance, in the first parliament of 1640, of the king's defiring 12 fulidies of the commons, to be levied in three years; which was looked upon as a flartling propofal: though Lord Clarendon tells us, that the speaker, serjeant Glanvile, made it manifest to the house, how very inconfiderable a fum 12 fubfidies amounted to, by telling them he had computed what he was to pay for them; and when he named the fum, he being known to be possessed of a great estate, it seemed not worth any farther deliberation. And, indeed, upon calculation, we shall find, that the total amount of these 12 subfidies, to be raised in three years, is less than what is now raifed in one year by a land-tax of 2 s. in the pound.

The grant of scutages, talliages, or subfidies by the commons, did not extend to spiritual preferments; those being usually taxed at the same time by the clergy themselves in convocation: which grants of the clergy were confirmed in parliament; otherwise they were illegal, and not binding; as the fame noble writer observes of the subsidies granted by the convocation, which continued fitting after the diffolution of the first parliament in 1640. A subsidy granted by the clergy was after the rate of 4 s. in the pound, according to the valuation of their livings in the king's books; and amounted, Sir Edward Coke tells us, to about 20,000 l. While this custom continued, convocations were wont to fit as frequently as parliaments : but the last subsidies, thus given by the clergy, were those confirmed by statute 15 Car. II. c. 10. fince which another method of taxation has generally prevailed, which takes in the clergy as well as the laity: in recompense for which, the beneficed clergy have from that period been allowed to vote at the election of knights of the shire; and thenceforward also the practice of giving ecclefiaftical fubfidies hath fallen into total difuse.

appointed by the crown, or the great officers of flate: and therefore in the beginning of the civil wars between Charles I. and his parliament, the latter, having no other fufficient revenue to support themselves and their measures, introduced the practice of laying weekly and monthly affeffments of a specific sum upon the feveral counties of the kingdom; to be levied by a pound-rate on lands and personal estates: which were occasionally continued during the whole usurnation, fometimes at the rate of 120,000 l. a month, fometimes at inferior rates. After the Restoration, the ancient method of granting fubfidies, inflead of fuch monthly affeffments, was twice, and twice only, renewed; viz. in 1663, when four subsidies were granted

1670, when 800,000 l. was raifed by way of fubfidy, which was the last time of raising supplies in that manner. For the monthly affeilments being now established by custom, being raised by commissioners named by parliament, and producing a more certain revenue; from that time forwards we hear no more of fublidies, but occasional affesiments were granted as the national emergencies required. These periodical affessments, the subsidies which preceded them, and the more ancient foutage, hydage, and talliage, were to all intents and purposes a land-tax; and the affestments were fometimes expressly called fo. Yet a popular opinion has prevailed, that the land-lax was first introduced in the reign of King William III.; because in the year 1602 a new affeffment or valuation of eftates was made throughout the kingdom: which, though by no means a perfect one, had this effect, that a supply of 500,000l, was equal to 1s. in the pound of the value of estates given in. And, according to this enhanced valuation, from the year 1693 to the present, a period of near a century, the land-tax has continued an annual charge upon the subject; about half the time at 4 s. in the pound, fometimes at 38. fometimes at 28. twice at 18. but without any total intermission. The medium has been 3s. 3 d. in the pound; being equivalent to 23 ancient subfidies, and amounting annually to more than a million and a half of money. The method of raifing it is by charging a particular fum upon each county, according to the valuation given in, A. D. 1692; and this fum is affeffed and raifed upon individuals (their personal estate, as well as real, being liable thereto), by commissioners appointed in the act, being the principal land holders in the county and their officers.

An act passes annually for the raising, in general, 2,037,6271. 9s. 101d. by the above faid tax at 4s. in the pound; whereof there shall be raised in the several counties in England, according to the proportions expressed in the act, 1,989,6731. 78. 104 d.; and in Scotland, 47,954l. 18. 2d. by an eight months cess of 5994l. 58. 13 d. per mensem, to be raised out of the land-rent, and to be paid at four terms, as specified in the act, by two months amount each time.

LAND. Waiter, an officer of the custom-house, whose duty is, upon landing any merchandife, to examine, tafte, weigh, measure them, &c. and to take an account thereof. In some ports they also execute the office of a coast-waiter. They are likewise occasionally styled The lay subfidy was usually raised by commissioners fearchers, and are to attend and join with the patent fearcher in the execution of all cockets for the shipping of goods to be exported to foreign parts; and in cases where drawbacks on bounties are to be paid to the merchant on the exportation of any goods, they, as well as the patent fearchers, are to certify the shipping thereof on the debentures.

LANDAFF, a town or village of Glamorganshire in South Wales, with a bishop's see, and on that account has the title of a city. It is seated upon an ascent on the river Taff, or Tave, near Cardiff; but the cathedral flands on a low ground, and is a large

flately building. The original flructure was built about the beginning of the 12th century. The building now used as the cathedral includes part of the 3 U 2

Landau body of the ancient one; but is in other respects as Landen, modern as the present century, about the middle of which the old church underwent fuch reparation as was almost equivalent to rebuilding. The ruins are at the west end of the modern church, and consist of the original western door-way, and part of the north and fouth fides. The arch over the door is circular, and has a well carved epifcopal statue immediately over it. On the upper part of the front under which this door stands is a whole length figure of the Virgin Mary, with a cross on the apex of the building. In this front are two rows of neat-pointed arches for windows; and on the north and fourh fides above mentioned are two circular door-cases half funk in the earth. These ruins exhibit an aspect very different from the prefent cathedral, the new part of which the architect formed principally on the Roman model, without confidering how incongruous this flyle of architecture is with the plan purfued in the ancient part .- Landaff is a place of but small extent, and has no market. It is a port town, however, and carries on a good trade, as it has a very tolerable harbour that opens into the Severn river about four miles diflant. The ruins of the bishop's palace show it to have been castellated. It was built in 1120, and was destroyed by Henry IV. W. Long. 3. 20. N. Lat.

> LANDAU, an ancient, handsome, and very strong town of France, in Lower Alface, It was formerly imperial, and belonged to Germany, till the treaty of Munster, when it was given up to France. It is feated on the river Zurich, in a pleasant fertile country.

E. Long. 8. 12. N. Lat. 49. 12. LANDEN, a town of the Austrian Netherlands, in Brabant, famous for a battle gained over the French

by the allies, in July 1693, when 20,000 men were killed. It is feated on the river Beck, in E. Long. 5. 5.

LANDEN (JOHN, F. R. S.) an eminent mathematician, was born at Peakirk, near Peterborough in Northamptonshire, in January 1719. He became very early a proficient in the mathematics, for we find him a very respectable contributor to the Ladies Diary in 1744; and he was foon among the foremost of those who then contributed to the support of that small but valuable publication, in which almost every English mashematician, who has arrived at any degree of eminence for the last half century, has contended for fame at one time of his life or other. Mr Landen continued his contributions to it at times, and under one fignature or other, till within a few years of his death.

It has been frequently observed, that the histories of literary men confift chiefly of an history of their writings, and the observation was never more fully verified than it will be in this article concerning Mr Landen.

In the 48th volume of the Philosophical Transactions for the year 1754, Mr Landen gave "An investigation of fome theorems which fuggest feveral very remarkable properties of the circle, and are at the fame time of confiderable use in resolving fractions, the denomi-

Thomas Simpson of Woolwich, a circumstance which Landen. will convey to those who are not themselves judges of it some idea of its merit. In the year 1755, he published a volume of about 160 pages, intitled "Mathematical Lucubrations." The title to this publication was made choice of as a means of informing the world. that the fludy of the mathematics was at that time rather the pursuit of his leifure hours than his principal employment; and indeed it continued to be fo the greatest part of his life, for about the year 1762 he was appointed agent to the right honourable the earl Fitzwilliam, and refigned that employment only two years before his death. Had it been otherwise, it seems highly probable he would have extended his refearches in the mathematics, to which he was most enthusiastically devoted, much farther than any other person has done. His lucubrations contain a variety of tracts relative to the rectification of curve lines, the fummation of feries, the finding of fluents, and many other points in the higher parts of the mathematics. About the latter end of the year 1757, or the beginning of 1758, he published proposals for printing by subscription "The Refidual Analysis, a new branch of the Algebraic art :" and in 1758 he published a small tract in quarto, intitled " A Discourse on the Residual Analysis," in which he resolved a variety of problems, to which the method of fluxions had been usually applied by a mode of reasoning entirely new; compared those folutions with folutions of the same problems, investigated by the fluxionary method; and showed that the folutions by his new method were, in general, more natural and elegant than the fluxionary

In the 51st volume of the Philosophical Transactions for the year 1760, he gave " A new method of computing the fums of a great number of infinite feries." This paper was also presented to the society by his ingenious friend the late Mr Thomas Simpson. In 1764, he published the first book of " The Residual Analysis," in a 4to volume of 218 pages, with several copperplates. In this treatife, befides explaining the principles which his new analysis was founded on, he applied it to drawing tangents and finding the properties of curve-lines; to describing their involutes and evolutes, finding the radius of curvature, their greatest and least ordinates, and points of contrary fluxure; to the determination of their cusps, and the drawing of affymptotes: and he proposed in a second book to extend the application of this new analysis to a great variety of mechanical and physical subjects. The papers which were to have formed this book lay long by him; but he never found leifure to put them in order for the prefs.

On the 16th of January 1766, Mr Landen was elected a fellow of the Royal Society, and admitted on the 24th of April following. In the 58th volume of the Philosophical Transactions for the year 1768, he gave a " Specimen of a new method of comparing curvilineal areas; by means of which many areas did not appear to be comparable by any other method;" nators of which are certain multinomicils into more a circumstance of no small importance in that part of sample ones, and by that means facilitate the compu-tation of fluents." This ingenious paper was handed motion. In the 60th volume of the same work for to the Society by that eminent mathematician the late the year 1770, he gave "Some new theorems for

ordinates are expressed by fractions of a certain form," lished in the year 1780. But what renders that voin a more concife and elegant manner than had been lume yet more valuable, is a very extensive appendix. done by Cotes, De Moivre, and others who had con- containing "Theorems for the calculation of fluents." fidered the fubject before him. In the 61st volume for 1771, he has investigated several new and useful complete and extensive than any which are to be found theorems for computing certain fluents, which are af- in any other author, and are chiefly of his own inveltifignable by arcs of the conic fections. This fubject had been confidered before both by Mr Maclaurin and Mr D'Alembert; but some of the theorems which were given by these celebrated mathematicians, being in part expressed by the difference between an arc of an hyperbola and its tangent, and that difference being not directly attainable when the arc and its tangent both become infinite, as they will do when the whole fluid is wanted, although fuch fluent be finite; these theorems therefore fail in those cases, and the computation becomes impracticable without farther help. This defect Mr Landen has removed by affigning the limit of the difference between the hyperbolic arc and its taugent, while the point of contact is supposed to be removed to an infinite distance from the vertex of the curve. And he concludes the paper with a curious and remarkable property relating to pendulous bodies, which is deducible from those theorems. In the fame year he published, " Animadvertions on Dr Stewart's computation of the fun's distance from the earth."

In the 65th volume of the Philosophical Transactions for 1775, he gave the investigation of a general theorem, which he had promifed in 1771, for finding the length of any arc of a conic hyperbola by means of two elliptic arcs; and observes, that by the theorems there investigated, both the elastic curve and the curve of equable recess from a given point, may be constructed in those cases where Mr Maclaurin's elegant method fails. In the 67th volume for 1777, he gave "A new theory of the motion of bodies revolving about an axis in free space, when that motion is difturbed by fome extraneous force, either percuffive or accelerative." At this time he did not know that the fubject had been handled by any person before him; and he considered only the motion of a sphere's spheroid and cylinder. The publication of this paper, however, was the cause of his being told, that the doctrine of rotatory motion had been confidered by M. D'Alembert; and purchasing that author's Opuscules Mathematiques, he there learned that M. D'Alembert was not the only one who had confidered the matter before him; for M. D'Alembert there speaks of some mathematician, though he does not mention his name, who, after reading what had been written on the fubject, doubted whether there be any folid whatever, befide the fphere, in which any line, paffing through its centre of gravity, will be a permanent axis of rotation. In confequence of this, Mr Landen took un the fubject again; and though he did not then give a folution to the general problem, viz. "To determine the motions of a body of any form whatever, revolving without reftraint about any axis passing through its centre of gravity," he fully removed every doubt of the kind which had been started by the perion alluded to by M. D'Alembert, and pointed out several bodies,

Landen. computing the whole areas of curve lines, where the equally curious, in a volume of Memoirs which he pub- Landen. The tables which contain these theorems are more gating; being fuch as had occurred to him in the course of a long and close application to mathematical studies in almost every branch of those sciences. In 1781, 1782, and 1783, he published three little tracts on the fummation of converging feries, in which he explained and showed the extent of some theorems which had been given for that purpose by M. de Moivre, Mr Sterling, and his old friend Thomas Simpson, in answer to some things which he thought had been written to the disparagement of those excellent mathematicians. It was the opinion of fome, that Mr Landen did not show less mathematical skill in explaining and illustrating these theorems, than he has done in his writings on original subjects; and that the authors of them were as little aware of the extent of their own theorems as the rest of the world were before Mr Landen's ingenuity made it obvious to all.

About the beginning of the year 1782, Mr Landen had made fuch improvements in his theory of rotatory motion, as enabled him, he thought, to give a folution of the general problem specified above; but finding the refult of it to differ very materially from the refult of the folution which had been given of it by M D'Alembert, and being not able to fee clearly where that gentleman had erred, he did not venture to make his own folution public. In the course of that year, having procured the Memoirs of the Berlin Academy for 1757, which contain M. Euler's folution of the problem, he found that this gentleman's folution gave the fame refult as had been deduced by M. D'Alembert; but the perspicuity of M. Euler's manner of writing enabled him to discover where he had erred, which the obscurity of the other did not do. The agreement, however, of two writers of fuch established reputation as M. Euler and M. D'Alembert made him long dubious of the truth of his own folution, and induced him to revise the process again and again with the utmost circumspection; and being every time more convinced that his own folution was right and theirs wrong, he at length gave it to the public in the 75th volume of the Philosophical Transactions for 1785.

The extreme difficulty of the subject, joined to the concife manner in which Mr Landen had been obliged to give his folution in order to confine it within proper limits for the Transactions, rendered it too difficult, or at least too laborious, a piece of business for most mathematicians to read it; and this circumstance, joined to the established reputation of Euler, induced many to think that his folution was right and Mr Landen's wrong; and there did not want attempts to prove it. But notwithstanding these attempts were manifestly wrong, and that every one who perufed them faw it. they convinced Mr Landen that there was a necessity for giving his folution at greater length, in order to render it more generally understood. About this time also he met by chance with the late P. Frisi's Cosmowhich, under certain dimensions, have that remakable graphic Physica et Mathematica; in the second part of property. This paper is given, among many others which there is a folution of this problem, agreeing in

Lanark.

fhire.

Landen the result with those of M. Euler and D'Alembert, Landguard, which is not furprifing, as P. Frifi employs the fame principle that they did. Here Mr Landen learned that M. Euler had revifed the folution which he had given formerly in the Berlin Memoirs, and given it another form and at greater length in a volume published at Gryphiswell in 1765, intitled, Theoria Motus corporum solidorum seu rigidorum. Having therefore procured this book. Mr Landen found the fame principles employed in it, and of course the same conclusion resulting from them that he had sound in M. Euler's former folution of the problems; but as the reasoning was given at greater length, he was enabled to fee more diffinctly how M. Euler had been led into the mistake, and to set that mistake in a stronger point of view. As he had been convinced of the necessity of explaining his ideas on the fubiect more fully, fo he now found it necessary to lose no time in setting about it. He had for feveral years been feverely afflicted with the stone in the bladder, and toward the latter part of his life to fuch a degree as to be confined to his bed for more than a month at a time: yet even this dreadful diforder did not abate his ardour for mathematical studies; for the second volume of his Memoirs, just now published, was written and revised during the intervals of his diforder. This volume, befide a folution of the general problem concerning rotatory motion, contains the resolution of the problem concerning the motion of a top; an investigation of the motion of the equinoxes, in which Mr Landen has first of any one pointed out the cause of Sir Isaac Newton's mistake in his folution of this celebrated problem; and fome other papers of confiderable importance. He just lived to see this work finished, and received a copy of it the day before his death, which happened on the 15th of January 1790, at Milton, near Peterborough, in the 71ft year of his age.

LANDERNEAU, a town of France, in Lower Bretagne, feated on the river Elboro, 20 miles eaft of Breft. In an inn here is a well which ebbs and flows like the fea, but at contrary times. E. Long. 4. 13.

N. Lat. 48. 25.

LANDGRAVE (formed of the German land " earth," and graff or grave, " judge" or "count"); a name formerly given to those who executed justice in behalf of the emperors, with regard to the internal policy of the country. The title does not feem to have been used before the 11th century. These judges were first appointed within a certain district of Germany: in process of time the title became hereditary, and these judges assumed the sovereignty of the several districts or countries over which they prefided. Landgrave is now applied by way of eminence to those sovereign princes of the empire who possess by inheritance certain estates called landgravates, and of which they receive the investiture of the emperor. There are four princes who have this title, viz. those of Thuringia, Hessia, Alface, and Leuchtenberg. There are also other landgraves who are not princes but counts of the empire. See Count.

LANDGRAVIATE, or LANDGRAVATE, the office, authority, jurisdiction, or territory, of a landgrave.

LANDGUARD-FORT feems to belong to Suffolk, but is in the limits of Effex, and has a fine prospect of

the coasts of both counties. It was erected, and is Landisfarn maintained, for the defence of the port of Harwich over against it; for it commands the entry of it from the fea up the Maning tree water, and will reach any ship that goes in or out. It is placed on a point of land fo furrounded with the fca at high-water, that it looks like a little island at least one mile from the shore. The making its foundation folid enough for fo good a fortification cost many years labour and a prodigious expence. It was built in the reign of King James I. when it was a much more confiderable fortification than now, having four bastions mounted with 60 very large guns, particularly those on the royal bastion, which would throw a 28 pound ball over Harwich. Here is a small garrison, with a governor, and a platform of guns. This fort is refitted and greatly enlarged for the conveniency of the officers of ordnance, engineers, and matroffes; and a barrack built for the foldiers.

LANDISFARN, or LINDESFARN, See Holr-

Ifland.

LANDRECY, a town of the French Netherlands in Hainault, ceded to France by the treaty of the Pyrenecs, and is now very well fortified. It was befieged by Prince Eugene in 1712, but to no purpofe. It is feated on a plain on the river Sambre, in E. Long.

LANDSCROON, a fea-port town of Sweden, in South Gothland, and territory of Schonen, feated on the Baltic Sea, within the Sound, 22 miles north of Copenhagen. E. Long. 14. 20. N. Lat. 55. 42.

LANDSDOWN, a place in Somersetskire, near Bath, with a fair on October 10th for cattle and

LANDSHUT, a strong town of Germany in Lower Bavaria, with a strong castle on an adjacent hill. It is feated on the river Ifcr, in E. Long. 1. 15. N. Lat. 48. 23. There is another small town of the fame name in Silefia, and in the duchy of Schweidnitz, feated on the river Zieder, which falls into the Bauber: and there is also another in Moravia, seated on the river Morave, on the confines of Hungary and Austria.

LANDSKIP. See LANDSCAPE.

LANERKSHIRE, a county of Scotland, called also Clydesdale, from the river Clyde, by which it is watered. It is bounded on the north by the county of Dumbarton; on the east by Stirling, Linlithgow, Edinburgh, and Peeoles, thires; on the fouth by Dumfries; and on the west by Ayr and Renfrew shires. Its extent from north to fouth is about 40 miles, from east to west 36 .- The river Clyde, descending from Scotlan I Dethe fouthern part of this county, divides it into two lineated, p.] almost equal parts; and after a course of about 50 315. &c. miles, meets the tide a little below Glasgow: (see GLASGOW). Proceeding up the river from Glasgow. the country is rich and well cultivated. Bothwell caftle, now in ruins, stands on an eminence which overlooks the Clyde. Some of its walls are still remaining, which measure 15 feet in thickness and 60 feet in

height. This vaft fabric was once the abode of a man

the most notoriously marked of any in the annals of

in ancient times a fubterraneous passage under the rithe defeat of the Covenanters by the duke of Monmouth in 1679 .- East from Bothwell castle, in an elevated fituation, flands the Kirk of Shots, amid a wild and barren country. This dreary walte is covered with heath; and though a high fituation, is flat, and very marshy in many places. It is chiefly employed as sheep-walks; and notwithstanding the vicinity of coal and lime, feems fearce capable of cultivation. This want is, however, compenfated by the abundance of iron flone and coal, which are here brought together by the hand of nature. Nor is this advantage confined to the barren tract in the north-east corner of the shire. The whole county abounds with these valuable minerals; and two iron works are erected on the banks of the Clyde, one a little above Glasgow and another at Cleland near Hamilton. But the most confiderable work of this kind in the county is that of Cleugh, a few miles fouth-east from the Kirk of Shots. A village is here built for the accommodation of the workmen. It is called Wilfontown from the name of the proprietors .- The small borough of Lanerk is situated on the brow of a hill, on the north-east fide of the Clyde, commanding a fine prospect over the river. In this neighbourhood are fome of the greatest cotton manufactories in Scotland. The Clyde near this place runs for feveral miles between high rocks covered with wood; and in its courfe exhibits many aftonishing cataracts: (fee the article CLYDE) .- From Lanerk, paffing the village of Carstairs, a few miles to the east we meet the fmall town of Carnwath. In this neigh-Bourhood, and along the Clyde to the fouth-eaft, there is much cultivation and rich pasture. To the fouth of Carnwath is the town of Biggar; where is feen the ruin of a collegiate church founded in 1545. -The lands about the villages of Coulter and Lamwith nothing but sheep-walks and pasture-grounds in tracing it to its fource.

In the fouthern part of the shire, generally called Clydesdale, the country is not less wild. Among the mountains here, or rather in a hollow near their fummit, we meet with the village of Leadhills, by some faid to be the highest human habitation in the island of Great Britain. Here, however, reside many hundreds of miners with their families. Thefe miners, though in a great measure excluded from fociety by their fituation, yet not only find means to procure a comfortable subsistence, but also pay more attention to the cultivation of the mind than many of their countrymen fituated feemingly in more favourable circumflances for the attainment of knowledge. As an evi-

Scotland for the audacity and fplendor of his crimes. ance of the country round. Neither tree, nor fhrub. Lanarks Between this castle and the priory of Blantyre on the nor verdure, nor picturesque rock, appear to amuse the opposite side of the Clyde, there is faid to have been eye. The spectator must plunge into the bowels of Lanefline these mountains for entertainment." The voins of lead ver. A little above stands Bothwell-bridge, noted for lie mostly north and fouth; and their thickness, which we feldom exceeds 40 feet, varies greatly in different parts. Some have been found filled with ore within two fathoms of the furface; others fink to the depth of gofathoms. The earl of Hopeton, the proprietor, has in his possession a folid mass of lead ore from these mines weighing five tons. His lordship has also, it is faid, a piece of native gold that weighs two ounces, which was found here. The lead fmelted at this place is all fent to Leith, where it has the privilege of being exported free of duty. The fearty pasture afforded by this barren region feeds fome sheep and cattle; but those in the neighbourhood of the mines fometimes perish by drinking of the water in which the lead ore has bean washed: for the lead-ore communicates a deleterious quality to the water, though that liquid acquires no hurtful taint from remaining in leaden pipes or cifterns. North from this mountainous

region lies Crawfordmuir.

About nine miles north of Leadhills, on the east fide of the fmall river Douglas, which falls into the Clyde a few miles below, flands Douglas caftle, for many ages the refidence of the fecond family in Scotland. A modern building has been erected on the fame fite, in imitation of the ancient castle. Near it flands the town of Douglas. A few miles to the north-east is Tinto, a remarkable conic mountain. round the bafe of which the Clyde makes a noble. fweep. Westward, beyond Douglas, the small river Netham defcends into the Clyde through the populous parish of Lismahago. - Hamilton house, the feat of the duke of Hamilton, stands in a plain between the rivers Clyde and Avon. It is a magnificent structure, furrounded by many venerable oaks. In the vicinity is the town of Hamilton, which contains many handfome houses: (see HAMILTON). Here are seen themington are fertile; but farther up the Clyde we meet ruins of a collegiate church, founded in 1451. At a little diftance from Hamilton-house is an elegant appendage to it called Chatelherault, the name of the ancient possessions held by the family in France. This building is feated on the river Avon, and is furrounded by woods and deep dells, and every rural beauty that can produce a pleafing effect on the imagination, -On the west of Hamilton is the little town of Kilbride; and to the fouth that of Strathavon, furrounded by the fertile tract from which it derives its name. In our way from Hamilton to Glasgow we meet with the ancient borough of Rutherglen, inhabited chiefly by weavers and other manufacturers: and the village of Govan stands on the fame fide of the river on the road from Glasgow to Renfrew.

4. 24. N. Lat. 47. 52.

LANGTON (Stephen), was born in England, but educated at Paris, and was greatly effeemed for his learning by the king and nobility of France. He was chancellor of Paris, a cardinal of Rome, and in the reign of king John was made archbishop of Canterbury by Pope Innocent III. in opposition both to the monks of Canterbury and to the king. Langton was one of the most illustrious men of his age for learning ; and continued archbishop 22 years, dying in 1228. A catalogue of his books is given by Bale and Tanner. LANGUAGE, in the proper fense of the word,

Definition fignifies the expression of our ideas and their various relations by certain articulate founds, which are nfed as the figns of those ideas and relations. By articulate founds are meant those modulations of simple voice, or of found emitted from the thorax, which are formed by means of the mouth and its feveral organs, - the teeth, the tongue, the lips, and the palate. In a more general fense the word language is fometimes used to denote all founds by which animals of any kind express their particular feelings and impulses in a manner that

Nature has endowed every animal with powers fuf-

ficient to make known all those of its fensations and

is intelligible to their own species.

defires, with which it is necessary, for the preservation of the individual or the continuance of the kind, that others of the fame species should be acquainted. For this purpole, the organs of all vocal animals are fo formed, as, upon any particular impulse, to utter founds, of which those of the same species inflinctively know the meaning. The fummons of the hen is instantly obeyed by the whole brood of chickens; and in many others of the irrational tribes a fimilar mode of communication may be observed between the parents and the offspring, and between one animal and its customary affociate. But it is not among animals of the same species only that these instinctive founds are mutually understood. It is Language, as necessary for animals to know the voices of their espects dif- nemies as the voices of their friends; and the roaring ferent from of the lion is a found of which, previous to all expethe infline rience, every beaft of the forest is naturally afraid. Between these animal voices and the language of men there is however very little analogy. Human language is capable of expressing ideas and notions, which there is every reason to believe that the brutal mind cannot conceive. " Speech (fays Aristotle) is made to indicate what is expedient and what inexpedient, and in confequence of this what is just and unjust. It is therefore given to men; because it is peculiar to them that of good and evil, just and unjust, they only (with respect to other animals) possess a sense or feeling." The voices of brutes feem intended by nature to express, not diffinct ideas or moral modes, but only such feelings as it is for the good of the species that they should have the power of making known; and in this, as in all other respects, these voices are times been caught, who, though they apparently possesanalogous; not to our speaking, but to our weeping, fed all the sagacity which is natural to man, and though Vol. IX. Part II.

natural and audible expressions of appetite and passion.

-Another difference between the language of men and the voices of brute animals confifts in articulation, by which the former may be refolved into diffinct elementary founds or fyllables; whereas the latter, being for the most part unarticulated, is not capable of such a refolution. Hence Homer and Hesiod characterize man by the epithet #1504, or "voice dividing," as denoting a power peculiar to the human species: for though there are a few birds the which utter founds that tor, cuckoo, may be divided into fyllables, yet each of these birds and East utters but one such found, which seems to be employed incia bird rather as notes of natural mulic than for the purpose called cocksof giving information to others; for when the bird is 400, &c. agitated, it utters cries which are very different, and have no articulation .- A third difference between Not from the language of men and the fignificant cries of brute nature or animals, is, that the former is from art and the latter inftinct, but from nature. Every human language islearned by imitation, and is intelligible only to those who either inhabit

the country where it is vernacular, or have been taught it by a mafter or by books: but the voices in question are not learned by imitation; and being wholly inflinctive, they are intelligible to all the animals of that species by which they are uttered, though brought together from the most distant countries on earth. That a dog, which had never heard another bark, would not withstanding bark himself, and that the barkings or yelps of a Lapland dog would be inflinctively understood by the dogs of Spain, Calabria, or any other country, are facts which admit not of doubt : but there is no reafon to imagine that a man who had never heard any language spoken would himself speak; and it is well known that the language spoken in one country is unintelligible to the natives of another country where a different language is spoken. Herodotus indeed records a fact which, could it be depended upon, would tend to overturn this reasoning, as it infers a natural relation between ideas and certain articulate founds. He tells us, that Pfammetichus king of Egypt, in order to discover which was the oldest language, caused two children, newly born of poor parents, to be brought up by a shepherd among his cattle, with a first injunction that they should never hear a human voice; and that at the end of two years the children pronounced at the same time the word sweet, which in the Phrygian language fignified bread. Either this is one of the many fables which that credulous historian collected among the Egyptians, or the conduct and reasoning of Psammetichus were very absurd; for it is added, that from this circumstance he inferred that the Phrygians were the most ancient people, and that they spoke the primitive language. The only rational purpose for which such an experiment could be inftituted, would be to difcover, not which is the oldest or the latest language, but whether there be fuch a thing as a language of nature or instinct : but in such a language it is obvious that there could be no word to denote bread, because in what is called the state of nature bread is unknown. The experiment of Pfammetichus was probably never made; but in the woods of different countries folitary favages have at different

tive crics of animals.

Language their organs both of hearing and of speech were perfect, never used articulate founds as figns of fensations or ideas. They uttered indeed the inarticulate cries which are inftinctively expressive of pleasure and pain, of joy and forrow, more diffinely and forcibly than men civilized; but with respect to the very rudiments of language, they were what Horace reprefents all mankind to have been originally, - mutum et turpe pecus. Indeed it feems to be obvious, that were there any inflinctive language, the first words uttered by all chil-

dren would be the fame; and that every child, whether born in the defert or in fociety, would underfland the language of every other child however educated or however neglected. Nay more, we may venture to affirm, that fuch a language, though its general use might, in fociety, be superseded by the prevailing dialect of art, could never be wholly loft; and that no man of one country would find it difficult, far less impossible, to communicate the knowledge of his natural and most pressing wants to the men of any other country, whether barbarous or civilized. The exercife of cultivated reason, and the arts of civil life, have indeed eradicated many of our original inftincts, but they have not eradicated them all: (fee Infeelings and defires, which appear in the most polished fociety, and which are confessedly instinctive. The passions, emotions, fensations, and appetites, are naturally expressed in the countenance by characters which the favage and the courtier can read with equal readinefs. The look ferene, the fmoothed brow, the dimpled fmile, and the gliftening eye, denote equanimity and good will in terms which no man mistakes. The contracted brow, the glaring eye, the fullen gloom, and the threatening air, denote rage, indignation, and defiance, as plainly and forcibly as revilings or imprecations. To teach men to difguife these instinctive indications of their temper, and

"To carry fmiles and funshine in their face,
"When discontent fits heavy at their heart,"

constitutes a great part of modern and refined education. Yet in spite of every effort of the utmost skill, and of every motive refulting from interest, the most confummate hypocrite, or the most hackneyed politician, is not always able to prevent his real disposition from becoming apparent in his countenance. He may indeed, by long practice, have acquired a very great command both over his temper and over the instinctive figns of it; but at times nature will predominate over art, and a fudden and violent paffion will flash in his face, so as to be visible to the eye of every beholder. If these observations be just, and we flatter ourselves with the belief that no man will call them in question, it feems to follow, that, if mankind were prompted by inflinct to use articulate founds as indications of their passions, affections, fensations, and ideas, the language of nature could never be wholly forgotten, and that it would fometimes predominate over the language of art. Groans, fighs, and fome inarticulate lively founds, are naturally expressive of pain and pleafure, and equally intelligible to all man-

kind. The occasional use of these no art can wholly Languages banith; and if there were articulate founds naturally expressive of the same feelings, it is not conceivable that art or education could banish the use of them, merely because by the organs of the mouth they are. broken into parts and refolvable into fyllables.

It being thus evident that there is no inflinctive articulated language, it has become an inquiry of fome importance, how mankind were first induced to fabricate articulate founds, and to employ them for the purpose of communicating their thoughts. Children learn to speak by insensible imitation; and when advanced fome years in life, they fludy foreign languages under proper instructors : but the first men had no fpeakers to imitate, and no formed language to fludy; by what means then did they learn to fpeak? On this Either requestion only two opinions can possibly be formed, vealed from question only two opinions can possibly be formed, venezing the Either language must have been originally revealed from heaven, or it must be the fruit of human industry. The vented by greater part of Jews and Christians, and even fome of min. the wifest pagans, have embraced the former opinion; which feems to be supported by the authority of Mofcs, who represents the Supreme Being as teaching our first parents the names of animals. The latter opinion is held by Diodorus Sioulus, Lucretius, Horace, and many other Greek and Roman writers, who confider language as one of the arts invented by man. The first men, fay they, lived for some time in woods and caves after the manner of beafts, uttering only confused and indistinct noises; till, affociating for mutual affiftance, they came by degrees to use articulate founds mutually agreed upon for the arbitrary figns or marks of those ideas in the mind of the speaker which he wanted to communicate to the hearer. This opinion fprung from the atomic cosmogony which was framed by Mochus the Phenician, and afterwards improved by Democritus and Epicurus; and though it is part of a fystem in which the first men are represented as having grown out of the earth like trees and other vegetables, it has been adopted by feveral modern writers (A) of high rank in the republic of letters, and is certainly in itself worthy of examination.

The most learned, and on every account the most Arguments respectable author who now supports this opinion, can for itsbeing didly acknowledges, that if language was invented, it of human was of very difficult invention, and far beyond the invention. reach of the groffeit favages. Accordingly he holds, that though men were originally folitary animals, and had no natural propenfity to the focial life; yet before language could be invented they must have been affociated for ages, and have carried on of concert fome common work. Nay, he is decidedly of opinion, that before the invention of an art fo difficult as language. men must not only have herded together, but have also formed fome kind of civil polity, have existed in that political state a very long time, and have acquired such powers of abstraction as to be able to form general ideas. (See Logic and METAPHYSICS). But it is obvious, that men could not have instituted civil polity, or have carried on of concert any common work, without communicating their defigns to each other : and there are four ways by which the author thinks that this could

⁽A) Father Simon, Voltaire, L'Abbe Condilliac, Dr Smith, and the author of the Origin and Progress of Language.

Manguage, have been done before the invention of speech; viz. Ift, inarticulate cries, expressive of fentiments and pasfons; 2d, geftures, and the expression of countenance; 3d, imitative founds expressive of audible things; and, 4th, painting, by which visible objects may be represented. Of these four ways of communication it is plain that only two have any connection with language, viz. inarticulate cries and imitative founds; and of these the author abandons the latter as having contributed nothing to the invention of articulation, though he thinks it may have helped to advance its progress. " I am disposed (says he) to believe, that the framing of words with an analogy to the found of the things expressed by them belongs rather to languages of art than to the first languages spoken by rude and barbarous nations." It is therefore inarticulate cries only that must have given rife to the formation of language. Such cries are used by all animals who have any use of voice to express their wants; and the fact is, that all harbarous nations have cries expressing different things, fuch as joy, grief, terror, furprife, and the like. Thefe, together with geftures and expression of the countenance, were undoubtedly the methods of communication first used by men; and we have but to Suppose (fays our author) a great number of our species carrying on fome common bufiness, and converting together by figns and cries; and we have men just in a flate proper for the invention of language. For if we fuppose their numbers to increase, their wants would increase also; and then these two methods of communication would become too confined for that larger fphere of life which their wants would make necessary. The only thing then that remained to be done was to give a greater variety to the inflinctive cries; and as the natural progress is from what is easy to what is more difficult, the first variation would be merely by tones from low to high, and from grave to acute. But this variety could not answer all the purposes of speech in fociety; and being advanced fo far, it was natural that an animal fo fagacious as man should go on farther, and come at last to the only other variation remaining, namely articulation. The first articulation would be very fimple, the voice being broken and diftinguished only by a few vowels and confonants. And as all natural cries are from the throat and larynx, with little or no operation of the organs of the mouth, it is natural to suppose, that the first languages were for the greater part spoken from the throat; that what confonants were used to vary the cries, were mostly guttural; and that the organs of the mouth would at first be very little employed. From this account of the origin of language it appears, that the first founds articulated were the natural cries by which men fignified their wants and defires to one another, fuch as calling one another for certain purposes, and other such things as were most necessary for carrying on any joint work: then in process of time other cries would be articulated, to fignify, that fuch and fuch actions had been performed or were performing, or that fuch and fuch events had happened relative to the common bufinefs. Then names would be invented of fuch objects as they were conversant with; but as we cannot suppose sa-

vages to be deep in abfraction or skilful in the art of Language. arranging things according to their genera and species, all things however fimilar, except perhaps the individuals of the lowest species, would be expressed by different words not related to each other either by derivation or composition. Thus would language grow by degrees; and as it grew, it would be more and more broken and articulated by confonants; but still the words would retain a great deal of their original nature of animal cries. And thus things would go one words unrelated ftill multiplying, till at laft the language would become too cumbersome for use; and then art would be obliged to interpose, and form a language upon a few radical words, according to the rules and method of etymology.

Those (B) who think that language was originally Arguments revealed from heaven, confider this account of its hu-for i's diman invention as a feries of mere suppositions hanging vine originloofely together, and the whole suspended from no fixed principle. The opinions of Diodorus, Vitruvius, Horace, Lucretius, and Cicero, which are frequently quoted in its support, are in their estimation of no greater authority than the opinions of other men; for as language was formed and brought to a great degree of perfection long before the era of any historian with whom we are acquainted, the antiquity of the Greek and Roman writers, who are comparatively of vefterday, gives them no advantage in this inquiry over the philosophers of France and England. Aristotle has defined man to be Guov MIMAIRON: and the definition is certainly fo far just, that man is much more remarkable for imitation than invention; and therefore, fay the reasoners on this fide of the question, had the human race been originally mutum et turpe pecus, they would have continued fo to the end of time, unless they had been taught to speak by some superior intelligence. That the first men sprung from the earth like vegetables, no modern philosopher has ventured to affert ; nor does there any where appear fufficient evidence that men were originally in the flate of favages. The oldest book extant contains the only rational cosmogony known to the ancient nations; and that book reprefents the first human inhabitants of this earth, not only as reasoning and speaking animals, but also as in a ftate of high perfection and happiness, of which they were deprived for disobedience to their Creator. Moses, fetting afide his claim to inspiration, deserves, from the confiltence of his narrative, at least as much credit as Mochus, or Democritus, or Epicurus; and from his prior antiquity, if antiquity could on this subject have any weight, he would deferve more, as having lived nearer to the period of which they all write. But the question respecting the origin of language may be decided without refling in authority of any kind, merely by confidering the nature of speech and the mental and corporeal powers of man. Those who maintain it to be of human invention, suppose men at first to have been folitary animals, afterwards to have herded together without government or subordination, then to have formed political focieties, and by their own exertions to have advanced from the groffest ignorance to the refinements of science. But, say the reasoners 3 X 2 whofe

Language, whose cause we are now pleading, this is a supposition cries of passion could be so modified and enlarged as Language.

contrary to all history and all experience. There is not upon record a fingle inftance well authenticated of a people emerging by their own efforts from barbarifm to civilization. There have indeed been many nations raifed from the flate of favages; but it is known that they were pol flied, not by their own repeated exertions, but by the influence of individuals or colonies from nations more enlightened than themselves. The original favages of Greece were tamed by the Pelasgi, a foreign tribe; and were afterwards further polified by Orpheus, Cecrops, Cadmus, &c. who derived their knowledge from Egypt and the East. The ancient Romans, a ferocious and motley crew, received the bleffings of law and religion from a fuccession of foreign kings: and the conquests of Rome at a later period contributed to civilize the rest of Europe. In America, the only two nations which at the invalion of the Spaniards could be faid to have advanced a fingle ftep from barbarifm, were indebted for their fuperiority over the other tribes, not to the gradual and unaffifted progrefs of the human mind, but to the wife inflitutions of fo-

reign legislators. This is not the proper place for tracing the progress of man from the favage state to that of political fociety (See SAVAGE State); but experience teaches us, that in every art it is much easier to improve than to invent. The human mind, when put into the proper track, is indeed capable of making great advances in arts and fciences; but if any credit be due to the records of history, it has not, in a people funk in ignorance and barbarity, fufficient vigour to discover that track, or to conceive a flate different from the prefent. If the rudest inhabitants of America and other countries have continued, as there is every reason to believe they have continued, for ages in the fame unvaried state of barbarism; how is it imaginable that people fo much ruder than they, as to be ignorant of all language, should think of inventing an art fo difficult as that of fpeech, or even to frame a conception of the thing? In building, fishing, hunting, navigating, &c. they might imitate the inflinctive arts of other animals; but there is no other animal that expresses its fensations and affections by arbitrary articulate founds .- It is faid, that before language could be invented, mankind must have existed for ages in large political societies, and have garried on of concert fome common work : but if inarticulate cries, and the natural visible figns of the passions and affections, were modes of communication fufficiently accurate to keep a large fociety together for ages, and to direct its members in the execution of fome common work, what could be their inducement to the invention of an art fo ufelefs and difficult as that of language? Let us however suppose, fay the advocates for the cause which we are now supporting, that different nations of favages fet about inventing an art of communicating their thoughts, which experience had taught them was not absolutely necessary; how came they all, without exception, to think of the one art of articulating the voice for this purpole? Inarticulate cries, out of which language is fabricated, have indeed an inflinctive connection with our passions and affections; but there are gestures and expressions of countenance with which our passions and affections

to be capable of communicating to the hearer every idea in the mind of the fpeaker, it is certain that the natural gestures could be so modified as to answer the very fame purpose (fee PANTOMIME); and it is strange that among the feveral nations who invented languages. not one should have stumbled upon fabricating visible figns of their ideas, but that all should have agreed to denote them by articulated founds. Every nation whofe language is narrow and rude fupplies its defects by violent gesticulation; and therefore, as much lefs genius is exerted in the improvement of any art than was requifite for its first invention, it is natural to suppole, that, had men been left to devile for themselves a method of communicating their thoughts, they would not have attempted any other than that by which they now improve the language transmitted by their fathers. It is vain to urge that articulate founds are fitter for the purpose of communicating thought than visible gesticulation: for though this may be true, it is a truth which could hardly occur to favages, who had never experienced the fitnefs of either; and if, to counterbalance the fuperior fitness of articulation, its extreme difficulty be taken into view, it must appear little lefs than miraculous that every favage tribe should think of it rather than the easier method of artificial gefficulation. Savages, it is well known, are remarkable for their indolence, and for always preferring eafe to utility; but their modes of life give fuch a pliancy to their bodies, that they could with very little trouble bend their limbs and members into any positions agreed upon as the figns of ideas. This is fo far from being the cafe with respect to the organs of articulation, that it is with extreme difficulty, if at all, that a man advanced in life can be taught to articulate any found which he has not been accustomed to hear. No foreigner who comes to England after the age of thirty, ever pronounces the language tolerably well; an Englishman of that age can hardly be taught to utter the guttural found which a Scotchman gives to the Greek x, or even the French found of the vowel u: and of the folitary favages who have been caught in different forests, we know not that there has been one who, after the age of manhood, learned to articulate any language fo as to make himfelf readily understood. The prefent age has indeed furnished many instances of deaf perfons being taught to fpeak intelligibly by skilful masters moulding the organs of the mouth into the positions proper for articulating the voice; but who was to perform this talk among the inventors of language, when all mankind were equally ignorant of the means by which articulation is effected? In a word, daily experience informs us, that men who have not learned to articulate in their childhood, never afterwards acquire the faculty of fpeech but by fuch helps as favages cannot obtain; and therefore, if speech was invented at all, it much have been either by children who were incapable of invention, or by men who were incapable of speech. A thousand, nay a million, of children could not think of inventing a language. While the organs are pliable, there is not understanding enough to frame the conception of a language; and by the time that there is understanding, the organs are become too stiff for the task. And therefore, fay the are in the same manner connected. If the natural advocates for the divine origin of language, reason as must have been speaking animals; the young having the tribes by whom they were spoken. If we suppose constantly acquired this art by imitating those who were elder; and we may warrantably conclude, that

our first parents received it by immediate inspiration. To this account of the origin of language an ob-

jection readily offers itself. If the first language was communicated by inspiration, it must have been perfect, and held in reverence by those who spake it, i. e. by all mankind. But a vaft variety of languages have prevailed in the world; and some of these which remain are known to be very imperfect, whilst there is reason to believe that many others are loft. If different languages were originally invented by different nations, all this would naturally follow from the mixture of these nations; but what could induce men possessed of one perfect language of divine original, to forfake it for barbarous jargons of their own invention. and in every respect inferior to that with which their forefathers or themfelves had been inspired?

In answer to this objection, it is faid, that nothing In what cir- was given by infpiration but the faculty of speech and eumstances the elements of language; for when once men had

perfect and language, it is easy to conceive how they might have copious ian modified it by their natural powers, as thousands can guage must improve what they could not invent. The first lan-become parrow and guage, if given by inspiration, must in its principles have had all the perfection of which language is fufbut it cannot be supposed that the All-wife Instructor they had not then acquired. It was sufficient that a all fides from what we may call the feat of government. In either case they would every where meet other natural causes would compel those who removed eastward or northward to adopt modes of life in many respects different from the modes of those who travelled towards the west or the fouth, a vast number of words would in one country be labricated to denote complex conceptions, which mult necessarily be unintelligible to the body of the people inhabiting countries where those conceptions had never been formed. Thus would various dialects be unavoidably introduced into the original language, even whilst all mankind remained in one fociety and under one government. But after feparate and independent focieties were formed, these variations would become more numerous, and the feeach other, as well as from the idiom and genius of the improvement and copiousness of their language

Language well as hiftory intimates, that mankind in all ages the parent tongue, in proportion to the diffance of Language;

a few people either to have been banished together from the fociety of their brethren, or to have wandered of their own accord to a dillance, from which through trackless forests they could not return (and such emigrations have often taken place), it is eafy to fee how the most copious language must in their mouths have foon become narrrow, and how the offspring of inspiration must have in time become so deformed as hardly to retain a feature of the ancestor whence it originally fprung. Men do not long retain a practical skill in those arts which they never exercife; and there are abundance of facts to prove, that a fingle man cast upon a defart island, and having to provide the necessaries of life by his own ingenuity, would foon lofe the art of speaking with fluency. his mother-tongue. A fmall number of men call away together, would indeed retain that art fomewhat longer; but in a space of time not very long, it would in a great measure be lost by them or their posterity. In this state of banishment, as their time would be almost wholly occupied in hunting, fishing, and other means within their reach to support a wretched existence, they would have very little leifure, and perhaps less defire, to preferve by conversation the remembrance of that eafe and those comforts of which they now found themselves for ever deprived; and they would ceptible; but from the nature of things it could not of course foon forget all the words which in their possibly be very copious. The words of language are native language had been used to denote the accommoeither proper names or the figns of ideas and relations; dations and elegancies of polified life. This at leaft feems to be certain, that they would not actempt to would load the memories of men with words to denote teach their children a part of language which in their things then unknown, or with the figns of ideas which circumstances could be of no use to them, and of which it would be impossible to make them comprefoundation was laid of fuch a nature as would support hend the meaning; for where there are no ideas, the the largest superstructure which they might ever after figns of ideas cannot be made intelligible. From such have occasion to raise upon it, and that they were colonies as this dispersed over the earth, it is probable taught the method of building by composition and that all those nations of savages have arisen, which derivation. This would long preferve the language have induced fo many philosophers to imagine that the radically the fame, though it could not prevent the flate of the favage was the original flate of man; and introduction of different dialects in the different coun- if fo, we fee that from the language of infpiration tries over which men fpread themselves. In whatever must have unavoidably sprung a number of different region we suppose the human race to have been origi- dialects all extremely rude and narrow, and retaining nally placed, the increase of their numbers would in nothing of the parent tongue, except perhaps the process of time either disperse them into different na- names of the most conspicuous objects of nature, and tions, or extend the one nation to a valt diffance on of those wants and enjoyments which are inseparable from humanity. The favage state has no artificial wants, and furnishes few ideas that require terms to with new objects, which would occasion the invention express them. The habits of solitude and silence inof new names; and as the difference of climate and cline a favage rarely to speak; and when he speaks, he uses the same terms to denote different ideas. Speech therefore, in this rude condition of men, must be extremely narrow and extremely various. Every new region, and every new climate, fuggetts different ideas, and creates different wants, which must be expressed either by terms entirely new or by old terms used with a new fignification. Hence must originate great diversity, even in the first elements of speech, among Hence the all lavage nations, the words retained of the original variety of language being used in various senses, and pronounced, tongues as we may believe, with various accents. When any which have of those favage tribes emerged from their barbarism, the world. whether by their own efforts or by the aid of people veral dialects would deviate faither and farther from more enlightened than themselves, it is obvious that

Tanguage. would keep pace with their own progress in knowledge and in the arts of civil life; but in the infinite multi-tude of words which civilization and refinement add to language, it would be little lefs than miraculous were any two nations to agree upon the same founds to represent the same ideas. Superior refinement, indeed, may induce imitation, conquests may impose a language, and extension of empires may melt down different nations and different dialects into one mass; but independent tribes naturally give rife to diventity of tongues, nor does it seem possible that they should retain more of the original language than the words expressive of the original language than the words expressive of those objects with which all men are at

all times equally concerned. The variety of tongues, therefore, the copiousness of fome, and the narrowness of others, furnish no good objection to the divine origin of language in general; for whether language was at first revealed from heaven, or in a course of ages invented by men, a multitude of dialects would inevitably arise as soon as the human race was feparated into a number of distinct and independent nations .- We pretend not to decide for our readers in a question of this nature; we have given the best arguments on both sides which we could either devife or find in the writings of others; and if it be feen, as we doubt not it will, that our own judgment leans to the fide of revelation, let it not be haftily condemned by those whose knowledge of languages extends no farther than to Greece and Rome, and France and England; for if they will carry their philological inquiries to the east, they may perhaps be able to trace the remains of one original language through a great part of the globe at this day (c). Language, whatever was its origin, must be subject to perpetual changes from its very nature, as well as from that variety of incidents which affect all fublu-Language nary things; and those changes must always correfpond with the change of circumtlances in the people the language is spoken. When any partir gauge of cular fet of ideas becomes prevalent among any speciety any people of men, words must be adopted to express them; and an index of from these the language must assume its character, their minds. Hence the language of a brave and martial people is bold and nervons, although perhaps rude and uncultivated; while the languages of those nations in which luxury and efferninacy prevail, are flowing and harmanious, but devoid of force and energy of expression.

But although it may be confidered as a general rule, Some exthat the language of any people is a very exact index ceptions to of the state of their minds, yet it admits of some par- the preceticular exceptions. For as man is naturally an imita- ding rule, tive animal, and in matters of this kind never has recourse to invention but through necessity, colonies planted by any nation, at whatever diffance from the mother-country, always retain the fame general founds and idiom of language with those from whom they are feparated. In process of time, however, the colonists and the people of the mother-country, by living under different climates, by being engaged in different occupations, and by adopting, of courfe, different modes of life, may lofe all knowledge of one another, affume different national characters, and form each a distinct language to themselves, totally different in genius and ftyle, though agreeing with one another in the fundamental founds and general idiom. If, therefore, this particular idiom, formed before their feparation, happen to be more peculiarly adapted to the genius of the mother-country than of the colonies, thefe will labour under an inconvenience on this account, which they may never be wholly able to overcome; and this inconvenience

⁽c) Numberless instances of this might be given, but our limits will permit us to produce only a very few. In the Shanferit, or ancient language of the Gentoos, our fignifies a day: (See Halbed's preface to the code of Gentoo laws). In other eaftern languages, the fame word was used to denote both light and fire. Thus in the Chaldee, UR is fire; in the Egyptian, OR is the fun or light, (Plut. de Ofir. et Ifid.): In the Hebrew, AUR is light: in the Greek, are is the air, often light: in Latin, AURA is the air, from the Æolic Greek; and in Irish it is AEAR. From the very same original we have the Greek word *up, and the English fire .- In Hebrew, OR fignifies to raife, lift up one's felf, or be raifed; hence plainly are derived the Greek ope, to raife, exsite, and the Latin ORIOR to arife; whence ORIENS the eaft, and Eng. orient, oriental; also Lat. origo, and Eng. origin, originate, &c .- The word KHUNT in the Shanfcrit dialect, fignifies a fmall territory, which is retained in Kursos, Kent, Canton, Cantabria. The word KHAN, KIN, CEAN, GAN, GEN, GIN, is of the fame kind, and pervades Afia and Europe from the Ganges to the Garrone. The word LIGHT English, LUCHT Flemish, LUX Roman, and AUXOG Greek, has been traced to Egypt. ARETZ, AREK, ERECH, HERTHA, EARTH, and ERDE, are all one word from Palestine and Chaldee to Britain and Germany .- The Chaldeans turned the Hebrew word shur or shor, which fignifies an ox, into Thor, as likewife did the Phenicians (See Plut, Vit. Syll.); hence the Greek ταυρού, the Latin taurus, the French taureau, and the Italian and Spanish toro. The Hebrew word BIT or BEITH, which fignifies cavity, capacity, the concave or infide of any place, has spread itself far and wide, still retaining nearly the original fignification; in the Persian language it is BAD, BED, BHAD, and fignifies a house or abode. In all the dialects of the Gothic tongue, BODE fignifies the fame thing; hence the English abide, abode, booth, boat, and the French batteau. In all these instances there is a friking refemblance in found as well as in fense between the derived and the primitive words; but this is not always the cafe, even when of the legitimacy of the derivation no doubt can be entertained. It has been shown (see Boswell's Life of Johnson), that the French JOUR, a day, is derived from the Latin DIES; but it may be certainly traced from a high r fource. In many of the oriental dialects, \mathbf{n}_1 , bright, is a same of the fant, hence the Greek a_1 , fpiplars, and the Latin DISS, a day. From DISS comes DIDSNUS, the pronunciation of which, either by the inaccuracy of the fpeaker or of the hearer, din is readily confounded with giu; then of the ablative of this adjective, corruptly pronounced giurno, the Italians make a fubflantive GIORNO, which by the French is readily contracted into GIOUR OF JOUR. From the fame root DI, comes A105, a, ov, the Eolic AiFos, the Latin DIYUS, and the Celtic BHIA, God.

Language inconvenience must prevent their language from ever attaining to that degree of perfection to which, by the genius of the people, it might otherwise have been carried. Thus various languages may have been formed out of one parent tongue; and thus that happy concurrence of circumflances which has raifed some languages to a high degree of perfection, may be eafily accounted for, while many ineffectual efforts have been made to raife other languages to the same degree of excellence.

> As the knowledge of languages conflitutes a great part of erudition, as their beauty and deformities furnish employment to taste, and as these depend much upon the idioms of the different tongues, we shall proceed to make a few remarks upon the advantages and defects of some of those idioms of language with which we are best acquainted .- As the words 1D10M and GE-NIUS of a language are often confounded, it will be necessary to inform the reader, that by idiom we would here be understood to mean that general mode of arranging words into fentences which prevails in any particular language; and by the GENIUS of a language, we mean to express the particular set of ideas which the words of any language, either from their formation or multiplicity, are most naturally apt to excite in the mind of any one who hears it properly uttered. Thus, although the English, French, Italian, and Spanish languages nearly agree in the same general IDIOM, yet the particular GENIUS of each is remarkably different: The English is naturally bold, nervous, and strongly articulated; the French is weaker, and more flowing; the Italian more foothing and harmonious; and the Spani/b more grave, fonorous, and flately. Now, when we examine the feveral languages which have been most esteemed in Europe, we find that there are only two idioms among them which are effentially diflinguished from one another; and [all those languages are divided between these two idioms, following fometimes the one and fometimes the other, either wholly or in part. The languages which may be faid to achere to the first iDiom, are those which in their construction follow the order of nature; that is, exprefs their ideas in the natural order in which they occur to the mind; the subject which occasions the action appearing first; then the action, accompanied with its feveral modifications; and, last of all, the object to which it has reference.- These may properly be called ANALOGOUS languages; and of this kind are the English, French, and most of the modern languages in Europe .- The languages which may be referred to the other intom, are those which follow no other order in their construction than what the taste or fancy of the compofer may fuggeft; fometimes making the object, fometimes the action, and fometimes the modification of the action, to precede or follow the other parts. The confusion which this might occasion, is avoided by the particular manner of infletting their words, by which they are made to refer to the others with which they ought to be connected, in whatever part of the sentence they occur, the mind being left at liberty to connect the feveral parts with one another after the whole fentence is concluded. And as the words may be here transposed at pleasure, those languages may be called TRANSPOSITIVE languages. To this class we must, in

an especial manner, refer the Latin and Greek lan-

guages .- As each of these IDIOMS has several advanta: Language. ges and defects peculiar to itself, we shall endeavour to point out the most considerable of them, in order to The transascertain with greater precision the particular character positivelanand excellence of fome of those languages now princi-guages pally spoken or studied in Europe.

The partiality which our forefathers, at the revi- with re-

val of letters in Europe, naturally entertained for the spect to Greek and Roman languages, made them look upon every diftinguishing peculiarity belonging to them as one of the many causes of the amazing superiority which those languages evidently enjoyed above every other at that time spoken in Europe .- This blind deserence still continues to be paid to them, as our minds are early prepoffeffed with these ideas, and as we are taught in our earliest infancy to believe, that to entertain the least idea of our own language being equal to the Greek or Latin in any particular whatever, would be a certain mark of ignorance or want of tafte .- Their rights, therefore, like those of the church in former ages, remain flill to be examined; and we, without exerting our reason to discover truth from falsehood, tarrely sit down fatisfied with the idea of their undoubted preeminence in every respect. But if we look around us for a moment, and observe the many excellent productions which are to be met with in almost every language of Europe, we must be satisfied, that even these are now possessed of some powers which might afford at least a prefumption, that, if they were cultivated with a proper degree of attention, they might, in fome respects, be made to rival, if not to excel, those beautiful and juftly admired remains of antiquity. Without endeavouring to derogate from their merit, let us, with the cool eye of philosophic reasoning, endeavour to bring before the facred tribunal of Truth some of those opinions which have been most generally received upon this subject, and reft the determination of the cause on her impartial decifion.

The learned reader well knows, that the feveral changes which take place in the arrangement of the words in every TRANSPOSITIVE language, could not be admitted without occasioning great confusion, unless certain classes of words were endowed with particular variations, by means of which they might be made to refer to the other words with which they ought naturally to be connected. From this cause proceeds the necessity of several variations of verbs, nouns, and adjectives; which are not in the least effential or necessary in the ANALOGOUS languages, as we have pretty fully explained under the article GRAMMAR, to which we refer for fatisfaction on this head. We shall in this place confider, whether these variations are an advantage or a difadvantage to language.

As it is generally supposed, that every language whose verbs admit of infledion, is on that account much more perfect than one where they are varied by auxiliaries; we shall, in the first place, examine this with fome degree of attention; and that what is faid on this head may be the more intelligible, we shall give examples from the Latin and English languages. We make choice of these languages, because the Latin is more purely transpositive than the Greek, and the English admits of les inflection than any other language that we are acquainted with.

If any preference be due to a language from the

Counds.

Diversity of three causes : - Either it must admit of a greater vafounds, va riety of founds, and confequently more room for harriety of ex-monious diversity of tones in the language :- or a greater freedom of expression is allowed in uttering any fimple idea, by the one admitting of a greater variety in the arrangement of the words which are necessary to express that idea than the other does :- or, lastly, a greater precision and accuracy in fixing the meaning of the person who uses the language, arise from the use of one of these forms, than from the use of the other; for, as every other circumstance which may serve to give a diverfity to language, fuch as the general and most prevalent founds, the frequent repetition of any one particular letter, and a variety of other circumflances of that nature, which may ferve to debafe a particular language, are not influenced in the least by the different methods of varying the verbs, they cannot be here confidered. We shall therefore proceed to make a comparison of the advantages or disadvantages which may accrue to a language by inflecting its yerbs with regard to each of these particulars,-variety of found, variety of arrangement, and accuracy of meaning.

The first particular that we have to examine is, Diversity of Whether the one method of expressing the variations of a verb admits of a greater variety of founds? In this respect the Latin seems, at first view, to have a great advantage over the English: for the words amo, amabam, amaveram, amavero, amem, &c. feem to be more different from one another than the English translations of thefe, I love, I did love, I had loved, I shall have loved, I may love, &c.; for although the fyilable AM is repeated in every one of the first, yet as the last fyllable usually strikes the ear with greater force, and leaves a greater impression than the first, it is very probable that many will think the frequent repetition of the word LOVE in the last instance, more striking to the ear than the repetition of am in the former. We will therefore allow this its full weight, and grant that there is as great, or even a greater difference between the founds of the different tenfes of a Latin verb. than there is between the words that are equivalent to them in English. But as we here consider the variety of founds of the language in general, before any just conclusion can be drawn, we must not only compare the different parts of the same verb, but also compare the different verbs with one another in each of these languages. And here, at first view, we perceive a most striking distinction in favour of the analogous language over the inflected: for as it would be impoffible to form a particular fet of inflections different from one another for each particular verb, all those languages which have adopted this method have been obliged to reduce their verbs into a fmall number of classes; all the words of each of which classes, commonly called conjugations, have the feveral variations of the modes, tenfes, and perfons, expressed exactly in the fame manner, which mutt of necessity introduce a fimilarity of founds into the language in general, much greater than where every particular verb always retains its own diffinguishing found. To be convinced of this. we need only repeat any number of verbs in Latin and English, and observe on which side the preference with respect to variety of sounds must fall.

Pono. I but. Moveo. I move. I give. Dono. Doleo. I ail. I fing. Cano. Lugeo. I mourn. I found. Obeo. I die. Orno, I adorn. Gaudeo. I rejoice: Pugno. I fight. I begin. Lego, Facio, I read. I make. Scribo. I write. Fodio. I dig. Puto. I think. Rideo. I laugh. I fill. Ambulo. I walk. Abstineo. I forbear.

The fimilarity of founds is here fo obvious in the Latin, as to be perceived at the first glance; nor can we be furprifed to find it fo, when we confider that all their regular verbs, amounting to 4000 or upwards, must be reduced to four conjugations, and even these differing but little from one another, which must of necessity produce the fameness of sounds which we here perceive; whereas, every language that follows the natural order, like the English, instead of this small number of uniform terminations, have almost as many distinct founds as original verbs in their language.

But if, instead of the present of the indicative mood. we should take almost any other tense of the Latin verb, the fimilarity of founds would be still more perceptible, as many of thefe tenfes have the fame termination in all the four conjugations, particularly in the

imperfect of the indicative, as below.

Pone-bam;	I did put,	I put.
Dona-bam;	I did give,	I gave.
Cane-bam;	I did fing,	I fung.
Sona-bam;	I did found,	I founded.
Orna-bam;	I did adorn,	I adorned.
Pugna-bam;	I did fight,	I fought.
Lege-bam;	I did read,	I read.
Scribe-bam;	I did write,	I wrote.
Puta-bam;	I did think,	I thought.
Vive-bam;	I did live,	I lived.
Ambula-bam;	I did walk,	I walked.
Move-bam:	I did move,	I moved.
Dole-bam;	I did ail,	I ailed.
Luge-bam;	I did mourn,	I mourned.
Obi-bam;	I did die,	
Gaude bam;	I did rejoice,	I died.
Incipie bam;	I did begin,	I rejoiced.
Facie-bam;		I began.
Fodie-bam;	I did make,	I made.
	I did dig,	I dug.
Ride-bam;	I did laugh,	I laughed.
Imple bam;	I did fill,	I filled.
Abitine-bam;	I did forbear,	I forbore.

It is unnecessary to make any remarks on the Latin words in this example: but in the English translation we have carefully marked in the first column the words without any inflection; and in the fecond, have put down the same meaning by an inflection of our verb; which we have been enabled to do, from a peculiar excellency in our own language unknown to any other either ancient or modern. Were it necessary to purfue this subject farther, we might observe, that the perfect tense in all the conjugations ends universally in I, the pluperfed in ERAM, and the future in AM or BO; in the subjunctive mood, the imperfed universally in REM, the perfect in ERIM, the pluperfect in ISSEM, and

Language, the future in ERO: and as a still greater sameness is observable in the different variations for the persons in these tenses, seeing the first person plural in all tenses ends in MUS, and the fecond person in TIS, with little variation in the other perfons; it is evident that, in respect of diversity of sounds, this method of conjugating verbs by inflection, is greatly inferior to the more natural method of expressing the various connections and relations of the verbal attributive by different words, ufually called auxiliaries.

The fecond particular, by which the different me-Variety of thods of marking the relation of the verbal attributive expressions can affect language, arises from the variety of expresfions which either of these may admit of in uttering the fame fentiment. In this respect, likewise, the method of conjugating by inflection feems to be deficient. Thus the present of the indicative mood in Latin can at most be expressed only in two ways, viz. SCRIBO, and EGO SCRIBO; which ought perhaps in ftrictness to be admitted only as one: whereas, in English, we can wary it in four different ways, viz. 1st, I WRITE; 2dly, I DO WRITE; 3dly, WRITE I DO; 4thly, WRITE DO I (D). And if we consider the further variation which these receive in power as well as in found, by having the emphasis placed on the different words; instead of four, we will find eleven different variations: thus, 1/t, I write, with the emphasis upon the I; - 2dly, I WRITE, with the emphasis upon the word WRITE. Let any one pronounce these with the different emphasis necessary, and he will be immediately satisfied that they are not only diftinct from each other with respect to meaning, but also with regard to found; and the fame must be understood of all the other parts of this example.

8. Write I Do. 3. I do write, Q. WRITE do I. 4. I no write, 10. Write DO I. 5. I do WRITE. 11. Write do I.

7. Write I do.

None of the Latin tenses admit of more variations than the two above mentioned: nor do almost any of the English admit of fewer than in the above example; and feveral of these phrases, which must be confidered as exact trauflations of some of the tenses of the Latin verb, admit of many more. Thus the imperfect of the fubjunctive mood, which in Latin admits of the above two variations, admits in English of the following:

1. I might bave written.

4. Written might have I.

2. Written I might have. 3. Have written I might. 6. Have written might I.

Vos. IX. Part II.

5. I written might have.

And if we likewife confider the variations which may Language. be produced by a variation of the emphasis, they will be as under.

1. I might have written. 13. WRITTENmight have I. 2. I MIGHT have written. 14. Written MIGHT have I.

3. I might HAVE written. 15. Written might HAVE I. 4. I might have WRITTEN. 16. Written might have I.

5. WRITTEN I might have. 17. I written night have. 6. Written I might have.

7. Written I MIGHT have. 19. I written MIGHT have. 8. Written I might HAVE. 20. I written might HAVE. 9. HAVE written I might.

21. Have written might I. 10. Have WRITTEN Imight. 22. HavewRITTEN might I.

11. Have written I might. 23. Have written MIGHT I. 12. Have written I MIGHT. 24. Have written might I.

In all 24 variations, instead of two.- If we likewife confider, that the Latins were obliged to employ the fame word, not only to express " I might have written, but alfo, " I could, I would, or I should have written;" each of which would admit of the same variations as the word might; we have in all ninety fix different expressions in English for the same phrase which in Latin admits only of two, unless they have recourse to other forced turns of expression, which the defects of their verbs in this particular has compelled them to in-

But if it should be objected, that the last circumflance we have taken notice of as a defect, can only be confidered as a defect of the Latin language, and is not to be attributed to the inflection of their verbs, feeing they might have had a particular tenfe for each of these different words might, could, would, and should; we answer, that, even admitting this excuse as valid, the fuperiority of the analogous language, as fuch, fill remains in this respect as 12 to 1 .- Yet even this concession is greater than ought to have been made : For as the difficulty of forming a fufficient variety of words for all the different modifications which a verb may be made to undergo is too great for any rude people to overcome; we find, that every nation which has adopted this mode of inflection, not excepting the Greeks themselves, has been obliged to remain satisfied with fewer words than would have been necessary even to effect this purpose, and make the same word ferve a double, treble, or even quadruple office, as in the Latin tense which gave rife to these observations: So that, however in physical necessity; this may not be chargeable upon this particular mode of conttruction, yet in moral certainty it must always be the case : and therefore we may fafely conclude, that the mode of varying verbs by inflection affords less variety in the arrangement of the words of the particular phrases,

⁽D) We are sufficiently aware, that the last variation cannot in strictness be considered as good language; although many examples of this manner of using it in serious compositions, both in poetry and profe, might be easily produced from the best authors in the English language. But however unjustifiable it may be to use it in serious composition; yet, when judiciously employed in works of humour, this and other forced expressions of the like nature produce a fine effect, by giving a burlesque air to the language, and beautifully contrasting it to the purer diction of solid reasoning. The sagacious Shakespeare has, on many occafions, showed how successfully these may be employed in composition, particularly in drawing the character of ancient Piffol in Henry V. Without this liberty, Butler would have found greater diffigulty in drawing the inimitable character of Hudibras .- Let this apology fuffice for our having inferted this and other variations of the same kind; which, although they may be often improper for serious composition, have still their use in Language.

Language, than the method of varying them by the help of auxi-

т8

guage.

But if there should still remain any shadow of doubt Precision of in the mind of the reader, whether the method of varying the verbs by inflection is inferior to that by auxithe English ligries, with regard to diversity of founds, or variety of expression; there cannot be the least doubt, but to the Lathat with respect to precision, distinctness, and accuracy, in expressing any idea, the latter enjoys a superiority beyond all comparison.— Thus the Latin verb Amo, may be Englished either by the words, I love, or I do love, and the emphasis placed upon any of the words that the circumstances may require; by means of which, the meaning is pointed out with a force and energy which it is altogether impossible to produce by the use of any fingle word. The following line from Shakespeare's Othello may ferve as an example :

> -Excellent wretch ! Perdition catch my foul, but I no love thee:

In which the krong emphasis upon the word Do, gives it a force and energy which conveys, in an irreliftible manner, a most perfect knowledge of the fituation of the mind of the speaker at the time .- That the whole energy of the expression depends upon this seemingly infignificant word, we may be at once fatisfied of, by keeping it away in this manner :

-Excellent wretch! Perdition catch my foul, but I love thee.

How poor-how tame-how infignificant is this, when compared with the other! Here nothing remains but a tame affertion, ushered in with a pompous exclamation which could not here be introduced with any degree of propriety. Whereas, in the way that Shakespeare has left it to us, it has an energy which nothing can furpals; for, overpowered with the irrefiltible force of Desdemona's charms, this strong exclamation is extorted from the foul of Othello in spite of himfelf. Surprifed at this tender emotion, which brings to his mind all those amiable qualities for which he had so much esteemed her, and at the same time fully impressed with the firm persuasion of her guilt, he bursts out into that feemingly inconfiftent exclamation, Excellent wretch! and then he adds in the warmth of his furprife, -thinking it a thing most attonishing that any warmth of affection should still remain in his breaft, he even confirms it with an oath, -Perdition catch my foul, but I Do love thee. - " In spite of all the falsehoods with which I know thou hast deceived me -in spite of all the crimes of which I know thee guilty-in spite of all those reasons for which I ought to hate thee—in spite of myself,—still I find that I love,—yes, I no love thee." We look upon it as a thing altogether impossible to transfuse the energy of this exprellion into any language whose verbs are regularly inflected.

In the fame manner we might go through all the other tenses, and show that the same superiority is to be found in each .- Thus, in the perfect tenfe of the Latins, in lead of the fimple AMAVI, we fay, I HAVE precife idea which we mean to excite: for if we fay, tion and precifion in the meaning. -It is, however, by auxilia-

I bave loved, with the emphasis upon the word I, it Language. at once points out the person as the principal object in that phrase, and makes us naturally look for a contraft in fome other perfon, and the other parts of the phrase becomes subordinate to it :- " HE has loved thee much, but I have loved thee infinitely more." The Latins too, as they were not prohibited from joining the pronoun with their verb, were also acquainted with this excellence, which Virgil has beautifully used in this verfe :

- Nos patriam fugimus ; Tu, Tityre, lentus in umbra, &c. But we are not only enabled thus to diftinguish the

person in as powerful a manner as the Latins, but can also with the same facility point out any of the other circumflances as principals; for if we fay, with the emphasis upon the word bave, "I HAVE loved," it as naturally points out the time as the principal object, and makes us look for a contrast in that peculiarity, I HAVE: "I have loved indeed: -my imagination has been led aftray-my reason has been perverted :- but. now that time has opened my eyes, I can fmile at those imaginary diffresses which once perplexed me," -In the same manner we can put the emphasis upon the other word of the phrase loved, -" I have LOVED." -Here the paffion is exhibted as the principal circumflance; and as this can never be excited without fome object, we naturally wish to know the object of that paffion-" Who! what have you loved?" are the natural questions we would put in this cafe. " I have LOVED -- Eliza." In this manner we are, on all occasions, enabled to express, with the utmost precifion, that particular idea which we would wish to excite, fo as to give an energy and perspicuity to the language, which can never be attained by those languages whose verbs are conjugated by inflection : and if to this we add the inconvenience which all inflected languages are fubject to, by having too fmall a number of tenfes, fo as to be compelled to make one word on many occasions supply the place of two, three, or even four, the balance is turned ftill more in our favour .- Thus, in Latin, the fame word AMABO stands for shall or will love, so that the reader is left to guess from the context which of the two meanings it was most likely the writer had in view .- In the same manner, may or can love are expressed by the same word AMEM; as are also might, could, would, or should love, by the fingle word AMAREM, as we have already observed; fo that the reader is left to guess which of thefe four meanings the writer intended to express: which occasions a perplexity very different from that clear precision which our language allows of, by not only pointing out the different words, but also by al-

fion it would have had without that affiftance. Upon the whole, therefore, after the most candid The meexamination, we must conclude, that the method corjugaof conjugating verbs by inflection is inferior to that ting verbs which is performed by the help of auxiliaries ;-be-b) inflec-LOVED; and by the liberty we have of putting the cause it does not alford such a divertity of sounds,—to a their emphasis upon any of the words which compose this nor allow such variety in the arrangement of expressions by phrase, we can in the most accurate manner fix the foot for the foot such as the contraction. phrase, we can in the most accurate manner fix the fion for the same thought, -nor give so great distinct performed

lowing us to put the emphasis upon any of them we

please, which superadds energy and force to the preci-

attended rics.

Language, attended with one confiderable advantage above the other method: for as the words of which it is formed are necessarily of greater length, and more fonorous, than in the analogous languages, it admits of a more flowing harmony of expression; for the number of monofyllables in this last greatly checks that pompous dignity which naturally refults from longer words. Whether this fingle advantage is fufficient to counterbalance all the other defects with which it is attended, is left to the judgment of the reader to determine :-

but we may remark, before we quit the subject, that

even this excellence is attended with fome peculiar in-

conveniences, which shall be more particularly pointed out in the fequel.

But perhaps it might still be objected, that although the comparison we have made above may be fair, and the conclusion just, with regard to the Latin and English languages; yet it does not appear clear, that on that account the method of conjugating verbs by inflection is inferior to that by auxiliaries; for although it be allowed that the Latin language is defective in point of tenses; yet if a language were formed which had a sufficient number of inflected tenfes to answer every purpose; if it had, for instance, a word properly formed for every variation of each tenfe; one for I love, another for I do love; one for I shall, another for I will love; one for I might, another for I could, and would, and should love; and so on through all the other tenfes; that this language would not be liable to the objections we have brought against the inflection of verbs; and that of course, the objections we have brought are only valid against those languages which have followed that mode and executed it imperfectly. -We answer, that although this would in some meafure remedy the evil, yet it would not remove it entirely. For, in the first place, unless every verb, or every fmall number of verbs, were conjugated in one way, having the found of the words in each tenfe, and division of tenses, as we may fav different from all the other conjugations,-it would always occasion a fameness of found, which would in fome meafure prevent that variety of founds fo proper for a language. And even if this could be effected, it would not give fuch a latitude to the expression as auxiliaries allow: for although there should be two words, one for I might, and another for I could love; yet as these are single words, they cannot be varied; whereas, by auxiliaries, either of these can be varied 24 different ways, as has been shown above. In the last place, no fingle word can ever express all that variety of meaning which we can do by the help of our auxiliaries and the emphasis. I have loved, if expressed by any one word, could only denote at all times one distinct meaning; fo that to give it the power of ours, three diffinct words at least would be necessary. However, if all this were done; that is, if there were a distinct conjugation formed for

every 40 or 50 verbs ;-if each of the tenfes were Language. properly formed, and all of them different from every other tense as well as every other verb; and these all carried through each of the different persons, so as to be all different from one another ; - and if likewife there were a diffinct word to mark each of the separate meanings which the same tense could be made to affume by means of the emphasis; and if all this infinite variety of words could be formed in a diffinct manner, different from each other, and harmonious; this language would have powers greater than any that could be formed by auxiliaries, if it were possible for the human powers to acquire fuch a degree of knowledge as to be able to employ it with facility. But how could this be attained, fince upwards of ten thoufand words would be necessary to form the variations of any one verb, and a hundred times that number would not include the knowledge of the verbs alone of fuch a language (E) !- How much, therefore, ought we to admire the simple perspicuity of our language, which enables us, by the proper application of ten or twelve feemingly trifling words, the meaning and ufe of which can be attained with the utmost ease, to express all that could be expressed by this unwieldy apparatus? What can equal the fimplicity or the power of the one method, but the well-known powers of the 24 letters, the knowledge of which can be obtained with fo much eafe-and their powers know no limits? -or, what can be compared to the fancied perfection of the other, but the transcript of it which the Chinese seem to have formed in their unintelligible lan-

Having thus confidered pretty fully the advantages and defects of each of these two methods of varying verbs, we cannot help feeling a fecret wish arise in our mind, that there had been a people fagacious enough to have united the powers of the one method with those of the other; nor can we help being surprifed, that among the changes which took place in the feveral languages of Europe after the downfal of the Roman monarchy, fome of them did not accidentally stumble on the method of doing it. From many concurring circumstances, it seems probable that the greatest part, if not all the Gothic nations that over-ran Italy at that time, had their verbs varied by the help of auxiliaries; and many of the modern European languages which have forung from them, have fo far borrowed from the Latin, as to have fome of the tenfes of their verbs inflected: yet the English alone have in any instance combined the joint powers of the two: which could only be done by forming inflections for the different tenfes in the fame manner as the Latins, and at the fame time retaining the original method of varying them by auxiliaries; by which means either the one or the other method could have been employed as occasion required. We have luckily two tenses formed

3 Y 2

⁽E) This affertion may perhaps appear to many very much exaggerated: but if any should think so, we only beg the favour that he will fet himself to mark all the variations of tenses, mode, person, and number, which an English verb can be made to assume, varying each of these in every way that it will admit, both as to the diversity of expression and the emphasis; he will soon be convinced that we have here said nothing more than enough.

Language. in that way; the prefent of the indicative, and the acrist of the paft. In almost all our verbs these can be declined either with or without auxiliaries. Thus the prefent, without an auxiliary, is, I love, I write, I speak; with an auxiliary, I do write, I do love, I do speak. In the fame manner, the past tense, by inslection, is, I loved, I wrote, I Spoke; by auxiliaries, I did love, I did Speak, I did write. Every author, who knows any thing of the power of the English language, knows the use which may be made of this diffinction. What a pity is it that we should have stopt short so soon! how blind was it in fo many other nations to imitate the defects, without making a proper use of that beautiful language which is now numbered among the dead !

Analogous and tranfpolitive languages cafes of nouns.

After the verbs, the next most considerable variation we find between the analogous and transfositive languages is in the nouns; the latter varying the different cases of these by inflection; whereas the former express all the different variations of them by the help of other words prefixed, called prepositions. Now, if we confider the advantages or difadvantages of either of these methods under the same heads as we have done the verbs, we shall find, that with regard to the first particular, viz. variety of founds, almost the same remarks may be made as upon the verbs; for if we compare any particular noun by itself, the variety of found appears much greater between the different cases in the transpositive, than between the translation of these in the analogous language. Thus REX, REGIS, REGI, REGEM, &c. are more diffinct from one another in point of found, that the translation of these, a king, of a king, to a king, a king, &c. But if we proceed one ftep further, and confider the variety which is produced in the language in general by the one or the other of these methods, the case is entirely reversed. For as it would have been impossible to form distinct variations, different from one another, for each case of every noun, they have been obliged to reduce all their nouns into a few general classes, called declensions, and to give to all those included under each class the same termination in every case; which produces a like fimilarity of found with what we already observed was occasioned to the verbs from the same cause; whereas in the analogous languages, as there is no necessity for any constraint, there is almost as great a variety of founds as their are of nouns. The Latins have only five different declenfions; fo that all the great number of words of this general order must be reduced to the very fmall diverfity of founds which thefe few claffes admit of; and even the founds of thefe few classes are not fo much diverlified as they might have been, as many of the different cases in the different declensions have exactly the same founds, as we shall have occasion to remark more fully hereafter. We might here produce examples to show the great fimilarity of founds between different nouns in the Latin language, and variety in the English, in the same way as we did of the verbs: but as every reader in the least acquainted with these two languages can fatisfy himfelf in this particular, without any further trouble than by marking down any number of Latin nouns, with their translations into English, we think it unnecessary to dwell longer on this particular.

But if the inflection of nouns is a difadvantage to a language in point of diverfity of founds, it is very

much the reverse with regard to the variety it allows Language, in the arranging the words of the phrase. Here, indeed, the transpositive language thines forth in all its Inferior glory, and the analogous mult yield the palm with with re-out the smallest dispute. For as the nominative case gard to the (or that noun which is the cause of the energy ex. arrangepressed by the verb) is different from the accusative (or ment of that noun upon which the energy expressed by the verb sentence; is exerted), these may be placed in any situation that but the writer shall think proper, without occasioning the fmallest confusion : whereas in the analogous languages. as these two different states of the noun are expressed by the fame word, they cannot be diftinguished but by their polition alone: fo that the noun which is the efficient cause must always precede the verb, and that which is the paffive subject must follow; which greatly cramps the harmonious flow of composition. - Thus the Latins, without the smallest perplexity in the meaning, could fay either Brutum amavit Caffius, or Cassius amavit Brutum, or Brutum Cassius amavit, or Cassius Brutum amavit. As the termination of the word Caffius always points out that it is in the nominative cafe. and therefore that he is the person from whom the energy proceeds; and in the fame manner, as the termination of the word Brutum points out that it is in the accufative cafe, and confequently that he is the object upon whom the energy is exerted; the meaning continues ftill diffinct and clear, notwithstanding of all these feveral variations: whereas in the English language, we could only fay Caffius loved Brutus, or, by a more forced phraseology, Cassius Brutus loved: Were we to reverse the case, as in the Latin, the meaning also would be reversed; for if we say Brutus loved Caffius, it is evident, that, instead of being the person beloved, as before, Brutus now becomes the person from whom the energy proceeds, and Cassius becomes the object beloved .- In this respect, therefore, the analogous languages are greatly inferior to the transpositive : and indeed it is from this fingle circumstance alone that they derive their chief excellence.

But although it thus appears evident, that any language, which has a particular variation of its nouns to diftinguish the accusative from the nominative case, has an advantage over those languages which have none; vet it does not appear that any other of their cafes adds to the variety, but rather the reverse : for, in Latin, we can only fay Amor Dei .; in English the same phrase may be rendered, either, - the love of God - of God the love, -or, by a more forced arrangement, God the love of. And as these oblique cases, as the Latins called them, except the accufative, are clearly diftinguished from one another, and from the nominative, by the prepolition which accompanies them, we are not confined to any particular arrangement with regard to these as with the accufative, but may place them in what order. we please, as in Milton's elegant invocation at the beginning of Paradife Loft:

Of man's first disobedience, and the fruit Of that forbidden tree, whose mortal tafte Brought death into the world, and all our wo, With lofs of Eden, till one greater man Restore us, and regain the blissful feat, Sing, heavenly Mufc.

In this fentence the transposition is almost as great as the

The former fupe rior in diverfity of found.

Language, the Latin language would admit of, and the meaning as diffinct as if Milton had begun with the plain language of profe, thus, --- "Heavenly muse, sing of man's

first disobedience," &c.

Before we leave this head, we may remark, that the little attention which feems to have been paid to this neculiar advantage derived from the use of an accusative case different from the nominative, is somewhat furprifing. The Latins, who had more occasion to attend to this with care than any other nation, and even the Greeks themselves, have in many cases overlooked it, as is evident from the various instances we meet with in their languages where this is not diftinguished. For all nouns of the neuter gender both in Greek and Latin have in every declenfion their nominative and accusative fingular alike. Nor in the plural of fuch nouns is there any diffinction between these two cases; and in Latin all nouns whatever of the third, fourth, and fifth declenfions, of which the number is very confiderable, have their nominative and accusative plural alike. So that their language reaps no advantage in this respect from almost one half of their nouns. Nor have any of the modern languages in Europe, however much they may have borrowed from the ancient languages in other respects, attempted to copy from them in this particular; from which perhaps more advantage would have been gained, than from copying all the other supposed excellencies of their language. - But to return to our fubject.

of meaning.

It remains that we confider, whether the inflection Greatly fu- of nouns gives any advantage over the method of defito precision ning them by prepositions, in point of diffinctness and precifion of meaning? But in this respect, too, the analogous languages must come off victorious. Indeed this is the particular in which their greatest excellence confifts, nor was it, we believe, ever disputed, but that, in point of accuracy and precision, this method must excel all others, however it may be defective in other refpects. We observed under this head, when speaking of verbs, that it might perhaps be possible to form a language by inflection which should be capable of as great accuracy as in the more fimple order of auxiliaries : but this would have been such an infinite labour, that it was not to be expected that ever human powers would have been able to accomplish it. More easy would it hive been to have formed the feveral inflections of the nouns fo different from one another, as to have rendered itimpossible ever to mistake the meaning. Yet even this ha not been attempted. And as we find that those language which have adopted the method of inflecting their vert are more imperfect in point of precision than the over, fo the same may be faid of inflecting the nouns: for, not to mention the energy which the analogous languages acquire by putting the accent upon the noun, or its preposition (when in an oblique case), according a the subject may require, to express which valation of meaning no particular variety of words hav been invested in any inflected language, they are no even complete in other respects. The Latin, in partialar, is in many cases descrive, the same termination sing employed in many instances for different cases othe same noun. Thus the genitive and dative fingulal and nominative and vocative plural, of the first declenin, are all exactly alike, and can only be distinguish from one another by the formation

of the fentences ; ... as are also the nominative, yoca. Language. tive, and ablative fingular, and the dative and ablative plural. In the fecond, the genitive fingular, and nominative and vocative plural, are the fame; as are alfo the dative and ablative fingular, and dative and ablative plural; except those in um, whose no minative. accufative, and vocative fingular, and nominative. accufative, and vocative plural, are alike. The other three declentions agree in as many of their cafes as thefe do : which evidently tends to perplex the meaning, unless the hearer is particularly attentive to, and well acquainted with, the particular confirmation of the other parts of the fentence; all of which is totally removed, and the clearest certainty exhibited at once, by the help of prepolitions in the analogous languages.

It will hardly be necessary to enter into such a minute examination of the advantages or difadvantages attending the variation of adjectives; as it will appear evident, from what has been already faid, that the endowing them with terminations fimiliar to, and corresponding with, fubstantives, must tend still more to increase the fimilarity of founds in any language. than any of those particulars we have already taken notice of; and were it not for the liberty which they have, in transpositive languages, of separating the adjective from the substantive, this must have occasioned fuch a jingle of fimilar founds as could not fail to have been most disgusting to the ear: but as it would have been impossible in many cases, in those languages where the verbs and nouns are inflected, to have pronounced the words which ought to have followed each other. unless their adjectives could have been separated from the fubftantives; therefore, to remedy this inconvenience, they were forced to devise this unnatural method of inflecting them also; by which means it is easy to recognise to what substantive any adjective has a reference, in whatever part of the fentence it may be placed. In these languages, therefore, this inflection. both as to gender, number, and cafe, becomes abfolutely necessary; and, by the divertity which it admitted in the arranging the words of the feveral phrases. might counterbalance the jingle of fimilar founds which it introduced into the language.

Having thus examined the most striking particu-These two lars in which the transpositive and analogous lan-different guages differ, and endeavoured to show the general ten- idioms of dency of every one of the particulars feparately, it language would not be fair to difmifs the fubject without con-compared fidering each of these as a whole as to their fidering each of thefe as a whole, and pointing out general eftheir general tendency in that light : for we all know, fects that it often happens in human inventions, that every part which composes a whole, taken separately, may appear extremely fine; and yet, when all these parts are put together, they may not agree, but produce a jarring and confusion very different from what we might have expected. We therefore imagine a few remarks upon the genius of each of these two distinct IDIOMS of language confidered as a whole will not be deemed useless.

Although all languages agree in this respect, that they are the means of conveying the ideas of one man The transto another; yet as there is an infinite variety of ways om fitteft in which we might wish to convey these ideas, some-for solemn times by the easy and familiar mode of conversation, compose and at other times by more folemn addresses to the tion.

fo happen, that the genius of one language may be

gous for

private

alogue.

converta tion and

ther, while another language may excel in the oppofite particular. This is exactly the case in the two general idioms of which we now treat. Every particular in a transpositive language, is peculiarly calculated for that folemn dignity which is necessary for pompous orations. Long founding words, formed by the inflection of the different parts of speech, - flowing periods, in which the attention is kept awake by the harmony of the founds, and in expectation of that word which is to unravel the whole, -if composed by a skilful artist, are admirably suited to that solemn dignity and awful grace which conflitute the effence of a public harangue. On the contrary, in private conver-The analofation, where the mind wishes to unbend itself with eafe, these become fo many clogs which encumber and perplex. At these moments we wish to transfuse our thoughts with eafe and facility-we are tired with written di- every unnecessary syllable-and wish to be freed from the trouble of attention as much as may be. Like our flate-robes, we would wish to lay afide our pompous language, and enjoy ourselves at home with freedom and eafe. Here the folemnity and windings of the transpositive language are burdensome; while the facility with which a fentiment can be expressed in the analogous language is the thing that we wish to acquire. Accordingly in Terence and Plautus, where the beauties of dialogue are most charmingly displayed, transposition is sparingly used. In this humble, though most engaging sphere, the analogous language moves unrivalled ; ... in this it wishes to indulge, and never tires. But it in vain attemps to rival the transpositive in dignity and pomp: The number of monofyllables interrupt the flow of harmony; and although they may give a greater variety of founds, yet they do not naturally poffefs that dignified gravity which fuits the other language. This, then, must be confidered as the striking particular in the genius of these two different iDIOM's, which marks their characters.

more properly adapted to the one of these than the o-

If we confider the effects which these two different characters of language mult naturally produce upon the people who employ them, we will foon perceive, that the genius of the analogous language is much more favourable for the most engaging purposes of life, the civilizing the human mind by mutual intercourse of thought, than the transpositive. For as it is chiefly by the use of speech that man is raised above the brute creation ; -as it is by this means he improves every faculty of his mind, and, to the observations which he may himself have made, has the additional advantage of the experience of those with whom he may converse, as well as the knowledge which the human race have acquired by the accumulated experience of all preceding ages ; - as it is by the enlivening glow of conversation that kindred souls catch fire from one another, that thought produces thought, and each improves upon the other, till they foar beyond the bounds which human reason, if left alone, could ever have aspired to ;-we must furely consider that language as the most beneficial to fociety, which most effectually removes these bars that obltruct its progress. Now, the genius of the analogous languages is fo eafy, so simple and plain, as to be within the reach of every one who is born in the kingdom where it is used

Language, understanding, by pompous declamation, &c. it may to speak it with facility; even the rudest among the Language. vulgar can hardly fall into any confiderable grammatical errors : whereas, in the transpositive languages, for many rules are necessary to be attended to, and fo much variation is produced in the meaning, by the flightest variations in the found, that it requires a study far above the reach of the illiterate mechanic ever to attain. So that, how perfect foever the language may be when fpoken with purity, the bulk of the nation must ever labour under the inconvenience of rudenefs and inaccuracy of speech, and all the evils which this naturally produces .- Accordingly, we find, that in Rome, a man, even in the highest rank, received as much honour, and was as much diftinguished among his equals, for being able to converse with ease, as a modern author would be for writing in an eafy and elegant ftyle; and Cæfar among his contemporaries was as much efteemed for his fuperiority in fpeaking the language in ordinary conversation with case and elegance, as for his powers of oratory, his skill in arms, or his excellence in literary composition. It is needless to point out the many inconveniences which this must nnavoidably produce in a state. It is sufficient to observe, that it naturally tends to introduce a valt distinction between the different orders of men; to fet an impenetrable barrier between those born in a high and those born in a low station; to keep the latter in ignorance and barbarity, while it elevates the former to fuch a height as must subject the other to be easily led by every popular demagogue. - How far the history of the nations who have followed this idiom of language confirms this observation, every one is left to judge for himself.

Having thus confidered LANGUAGE in general, and pointed out the genius and tendency of the two most diffinguished idioms which have prevailed; we shall close these remarks with a few observations upon the particular nature and genius of those languages which are now chiefly spoken or studied in Europe.

Of all the nations whose memory history has transmitted to us, none have been fo eminently distinguished tions on for their literary accomplishments, as well as acquain-those lantance with the polite arts, as the Greeks; nor are we guages as yet acquainted with a language possessed of fo many which are advantages, with fo few defects, as that which they coken or used, and which continues still to be known by theirstudied in name. - The necessary connection between the progras Europe. of knowledge and the improvement of languagenas been already explained; fo that it will not b furprifing to find their progress in the one ker pace with that of the other: but it will be of stility to point out fome advantages which that dringuished people poffeffed, which other nations, penaps not lefs diffinguished for talents or tafte, hav not enjoyed, which have contributed to render that language the most universally admired in ancient as well as is modern

It has been already observed, that the original inhabitants of Greece, who were gross lavages, and whose lan- The great guage of course would be very rude and na ow, were first superiority tamed by the Pelasgi, an eattern or an Byptian tribe. Greek lan-From the east it is well known that as and sciences guage, ow were spread over the rest of the world and that Egypt ing to what was one of the countries first civzed. The lan-causes, guage therefore imported into Gree by the Pelasgi would be pure from the founta head, and much

Language, more perfect in its ftructure than if it had been tranf- tion which took place between these states, which ex- Language. mitted through many nations. But this was not the only circumstance highly fortunate for the Greek language. Before it had time to be fully established among the people, its asperities, which it had in common with the other dialects of the east, were polished away by fuch a fuccession of poets, musicians, philofophers, and legislators, from different countries, as never appeared in any other nation at a period fo early as to give their genius and tafte its full influence. In this respect, no people were ever so eminently distinguished as the ancient Greeks, who had their Orpheus, their Linus, their Cecrops, and their Cadmus, who introduced their different improvements at a time when the nation had no standard of taste formed by itself. Hence the original founds of the Greek language are the most harmonious, and the most agreeable to the ear, of any that have hitherto been invented. They are indeed agrecable to every person who hears them, even when the meaning of the words is not understood: whereas almost all other languages, till they are underflood, appear, to an ear which has not been accustomed to them, jarring and discordant. This is the fundamental excellence of that justly admired language; nor have the people failed to improve this to the utmost of their power, by many aids of their own invention. The Greek language is of the transpositive kind: but a people fo lively, fo acute, and fo loquacious, could ill bear the ceremonious restraint to which that mode of language naturally subjected them; and have therefore, by various methods, freed it in a great measure from the stiffness which that produced. In inflecting their nouns and verbs, they fometimes prefix a fyllable, and fometimes add one; which, befides the variety that it gives to the founds of the language, adds greatly to the diffinctness, and admits of a more natural arrangement of the words than in the Latin, and of confequence renders it much fitter for the eafinefs of private conversation : and indeed the genius of the people fo far prevailed over the idiom of the language, as to render it, in the age of its greatest perfection, capable of almost as much ease, and requiring almost as little transposition of words, as those languages which have been called analogous. But as those nations who spoke this language were all governed by popular affemblies, and as no authority could be obtained among them but by a skill in rhetoric and the powers of persuasion; it became necessary for every one, who wished to acquire power or confideration in the flate, to improve himfelf in the knowledge of that language, in the use of which alone he could expect honours or reputation. Hence it happened, that while the vivacity of the people rendered it easy, the great men fludiously improved every excellence that it could reap from its powers as a transpositive language; fo that, when brought to its utmost perfection by the amazing genius of the great Demosthenes, it attained a power altogether unknown to any other language.-Thus happily cir-

cited in the ftrongest degree the talents of the people: it acquired a copiousness unknown to any ancient language, and excelled by few of the moderns .- In point of harmony of numbers, it is altogether unrivalled ; and on account of the eafe as well as dignity which, from the causes above mentioned, it acquired, it admits of perfection in a greater number of particular kinds of composition than any other language known. -The irrefiftible force and overwhelming impetuofity of Demosthenes feems not more natural to the genius of the language, than the more flowery charms of Plato's calm and harmonious cadences, or the unadorned fimplicity of Xenophon; nor does the majestic pomp of Homer feem to be more agreeable to the genius of the language in which he wrote, than the more humble strains of Theoritus, or the laughing festivity of Anacreon: Equally adapted to all purposes, when we perufe any of these authors, we would imagine the language was most happily adapted for his particular flyle alone. The fame powers it likewife, in a great measure, possessed for conversation; and the dialogue feems not more natural for the dignity of Sophocles or Euripides, than for the more easy tenderness of Menander, or buffoonery of Ariftophanes .- With all thefe advantages, however, it must be acknowledged, that it did not poffess that unexceptionable clearness of meaning which fome analogous languages enjoy, or that characteristic force which the emphasis properly varied has power to give, were not these defects counterbalanced by other caufes which we shall afterwards point out.

The Romans, a people of fierce and warlike difpo-The Latin fitions, for many ages during the infancy of their re-language public, more intent on pursuing conquests and military inferior to glory than in making improvements in literature or and why.

the fine arts, bestowed little attention to their language. Of a disposition less social or more phlegmatic than the Greeks, they gave themselves no trouble about rendering their language fit for conversation; and it remained ftrong and nervous, but, like their ideas, was limited and confined. More disposed to command respect by the power of their arms than by the force of persuasion, they despised the more effeminate powers of fpeech: fo that, before the Punic wars, their language was perhaps more referved and uncourtly than any other at that time known .- But after their rival Carthage was destroyed, and they had no longer that powerful curb upon their ambition; when riches flowed in upon them by the multiplicity of their conquetts: -luxury began to prevail, the ftern aufterity of their manners to relax, and felfish ambition to take place of that difinterested love for their country so eminently confpicuous among all orders of men before that period .- Popularity began then to be courted : ambitious men, finding themselves not possessed of that merit which infured them fuccess with the virtuous fenate, amused the mob with artful and seditious hacumstanced, the Greek language arrived at that envied rangues; and by making them believe that they were pre eminence which it still jully retains. From the possessed of all power, and had their facred rights enprogress of arts and sciences; from the gaiety and in- croached upon by the senate, led them about at their ventive genius of the people; from the number of free pleasure, and got themselves exalted to honours and flates into which Greece was divided, each of which riches by thefe infidious arts. It was then the Roinvented words of its own, all of which contributed to mans first began to perceive the use to which a comthe general flock; and from the natural communica- mand of language could be put. Ambitious men.

Language, then fludied it with care, to be able to accomplish been spoken have been subjected to the voke of for Language. the attacks of their adversaries .- Thus it happened. that in a short time that people, from having entirely neglected, began to fludy their language with the greatest affiduity; and as Greece happened to be fubjected to the Roman yoke about that time, and a friendly intercourse was established between these two countries, this greatly conspired to nourish in the minds of the Romans a talke for that art of which they had lately become fo much enamoured. Greece had long before this period been corrupted by luxury: their tafte for the fine arts had degenerated into unnecessary refinement; and all their patriotism consisted in popular harangues and unmeaning declamation. Oratory was then fludied as a refined art; and all the fubtleties of it were taught by rule, with as great care as the gladiators were afterwards trained up in Rome. But while they were thus idly trying who should be the lord of their own people, the nerves of government were relaxed, and they became an eafy prey to every invading power. In this fituation they became the fubicals, under the title of the allies, of Rome, and introfluced among them the same taste for haranguing which prevailed among themselves. Well acquainted as they were with the powers of their own language, they fet themselves with unwearied assiduity to polish and improve that of their new masters; but with all their affiduity and pains, they never were able to make it arrive at that perfection which their own language had acquired; and in the Augustan age, when it had arrived at the fummit of its glory, Cicero bitterly complains of its want of copioufness in many particulars.

But as it was the defire of all who studied this lannot be car-guage with care, to make it capable of that stately dignity and pomp necessary for public harangues, they followed the genius of the language in this particular, and in a great measure neglected those lesser delicacies which form the pleasure of domestic enjoyment; fo that, while it acquired more copiousness, more harmony, and precision, it remained stiff and inflexible for conversation: nor could the minute distinction of nice grammatical rules be ever brought down to the apprehension of the vulgar; whence the language spoken among the lower class of people remained rude and unpolished even to the end of the monarchy. The Huns who over-run Italy, incapable of acquiring any knowledge of fuch a difficult and abitrule language, never adopted it; and the native inhabitants being made acquainted with a language more natural and eafily acquired, quickly adopted that idiom of speech introduced by their conquerors, although they ftill retained many of those words which the confined nature of the barbarian language made necessary to allow them to express their ideas .- And thus it was that the language of Rome, that proud mistress of the world, from an original defect in its formation, although it had been carried to a perfection in other refpects far fuperior to any northern language at that time, eafily gave way to them, and in a few ages the knowledge of it was loft among mankind : while, on the contrary, the more eafy nature of the Greek lan-

their ends; while the more virtuous were obliged to reign dominion for upwards of two thousand years. acquire a skill in this, that they might be able to repel and their country has been twice ravaged by barbarous nations, and more cruelly depressed than ever the Romans were.

From the view which we have already given of the Latin language, it appears evident, that its idiom was more thrictly transpositive than that of any other language yet known, and was attended with all the defects to which that idiom is naturally subjected : nor could it boaft of fuch favourable alleviating circumftances as the Greek, the prevailing founds of the Latin being far less harmonious to the ear; and although the formation of the words are fuch as to admit of full and distinct founds, and fo modulated as to lay no reffraint upon the voice of the fpeaker; yet, to a person unacquainted with the language, they do not convey that enchanting harmony fo remarkable in the Greek language. The Latin is stately and folemn; it does not excite difguft; but at the fame time it does not charm the ear, fo as to make it liften with delightful attention. To one acquainted with the language indeed, the nervous boldness of the thoughts, the harmonious rounding of the periods, the full folemn fwelling of the founds, fo diftinguishable in the most eminent writers in that language which have been preferved to us, all conspire to make it pleasing and agreeable .-In these admired works we meet with all its beauties, without perceiving any of its defects; and we naturally admire, as perfect, a language which is capable of producing fuch excellent works .- Yet with all thefe feeming excellencies, this language is lefs copious, and more limited in its flyle of composition, than many modern languages; far less capable of precision and accuracy than almost any of these; and infinitely behind them all in point of eafiness in conversation. But these points have been so fully proved already, as to require no further illustration .- Of the compositions in that language which have been preferved to us, the Orations of Cicero are beit adapted to the genius of the language, and we there fee it in its utmost perfection. In the Philosophical Works of that great author we perceive fome of its defects; and it requires all the powers of that great man to render his Epiffles agreeable, as these have the genius of the language to ftruggle with .- Next to oratory, history agrees with the genius of this language; and Cæfar, in his Commentaries, has exhibited the language in its purest elegance, without the aid of pomp or foreign ornament .- Among the poets, Virgil has belt adapted his works to his language. The flowing harmony and pomp of it is well adapted for the epic strain, and the correct delicacy of his tafte rendered him perfectly equal to the task. But Horace is the only poet whose force of genius was able to overcome the bars which the language threw in his way, and fucceed in lyric poetry. Were it not for the brilliancy of the thoughts, and acuteness of the remarks, which so eminently distinguish this author's compositions, his odes would long erc now have funk into utter oblivion. But so conscious have all the Roman poets been of the unfitness of their language for eafy dialogue, that almost none of them, after Plautus and Terence, have attempted guage has still been able to keep some slight footing any dramatic compositions in that language. Nor in the world, although the nations in which it has have we any reason to regret that they neglected this

It could €ame degree of per

Nº 174.

become fond of these, they would have been obliged to have adopted fo many unnatural contrivances to render them agrecable, as would have prevented us (who of course would have confidered ourselves as bound to follow them) from making that progress in the drama which fo particularly diftinguishes the productions of modern times.

The Italian The modern Italian language, from an inattention language of too common in literary fubjects, has been usually called Gothic idi- a child of the Latin language, and is commonly believed to be the ancient Latin a little debased by the mixture of the barbarous language of those people who conquered Italy. The truth is, the case is directly the reverse: for this language, in its general idiom and fundamental principles, is evidently of the analogous kind, first introduced by those fierce invaders, although it has borrowed many of its words, and fome of its modes of phraseology, from the Latin, with which they were so intimately blended that this could scarcely be avoided; and it has been from remarking this flight connection fo obvious at first fight, that fuperficial observers have been led to draw this general con-

clusion, so contrary to fact.

When Italy was over-run with the Lombards, and the empire destroyed by these northern invaders, they, as conquerors, continued to fpeak their own native language. Fierce and illiterate, they would not stoop to the fervility of fludying a language fo clogged with rules, and difficult of attainment, as the Latin would naturally be to a people altogether unacquainted with nice grammatical diffinctions: while the Romans of necessity were obliged to fludy the language of their conquerors, as well to obtain fome relief of their grievances by prayers and fupplications, as to defroy that odious distinction which subsisted between the conquerors and conquered while they continued as diffinct people. As the language of their new matters, although rude and confined, was natural in its order, and easy to be acquired, the Latins would foon attain a competent skill in it: and as they bore such a proportion to the whole number of people, the whole language would partake fomewhat of the general found of the former: for, in spite of all their efforts to the contrary, the organs of speech could not at once be made to acquire a perfect power of uttering any unaccustomed founds; and as it behoved the language of the barbarians to be much less copious than the Latin. whenever they found themselves at a loss for a word, they would naturally adopt those which most readily presented themselves from their new subjects. Thus a language in time was formed, fomewhat refembling the Latin both in the general tenor of the founds and in the meaning of many words: and as the barbarians gave themselves little trouble about language, and in fome cases perhaps hardly knew the general analogy of their own language, it is not furprifing if their new subjects should find themselves sometimes at a loss on that account; or if, in these situations, they followed, on fome occasions, the analogy suggested to degree of mixture of heterogeneous grammatical ana-Vol. IX. Part II.

Language branch of poetry, as it is probable, if they had ever before their mixture with the Latins and other people Language. in their provinces, the feveral grammatical parts of fpeech followed the plain simple idea which that supposes; the verbs and nouns were all probably varied by auxiliaries, and their adjectives retained their fimple unalterable flate :- but by their mixture with the Latins, this fimple form has been in many cases altered: their verbs became in fome cases inflected; but their nouns in all these languages still retained their original form; although they have varied their adjectives, and foolifhly clogged their nouns with gender, according 33 to the Latin idioms. From this heterogeneous and Has the defortuitous (as we may fay, because injudicious) mix-both ita ture of parts, refults a language poffeffing almost all parent the defects of each of the languages of which it is com-tongues. posed, with few of the excellencies of either: for it has neither the ease and precision of the analogous, nor the pomp and boldness of the transpositive, languages; at the fame time that it is clogged with almost as many

rules, and liable to as great abuses.

These observations are equally applicable to the French and Spanish as to the Italian language, With regard to this last in particular, we may observe, that as the natural inhabitants of Italy, before the last invafion of the barbarians, were funk and enervated by luxury, and that by depression of mind and genius which anarchy always produces, they had become fond of feathing and entertainments, and the enjoyment of fenfual pleafures constituted their highest delight; and their language partook of the fame debility as their body .- The barbarians too, unaccustomed to the feductions of pleasure, soon fell from their original boldness and intrepidity, and, like Hannibal's troops of old, were enervated by the fenfual gratifications in which a nation of conquerors unaccustomed to the reftraint of government freely indulged. The foftness of the air, the fertility of the climate, the unaccustomed flow of riches which they at once acquired, together with the voluptuous manner of their conquered fubjects; all conspired to enervate their minds, and render them foft and effeminate. No wonder then, if a language new-moulded at this juncture should partake of the genius of the people who formed it; and instead of participating of the martial boldness and ferocity of either of their ancestors, should be softened and enfeebled by every device which an effeminate people could invent.-The strong confonants which terminated the words, and gave them life and boldness, being thought too harsh for the delicate ears of these fons of floth, were banished their language; while fonorous vowels, which could be protracted to any length in music, were substituted in their stead .- Thus the And Italian language is formed flowing and harmonious, though but defititute of those nerves which constitute the flowing and harmoni ftrength and vigour of a language: at the fame time, ous, is too the founds are neither enough diversified, nor in them-feeble for felves of fuch an agreeable tone, as to afford great the highest pleasure without the aid of musical notes; and the species of fmall pleafure which this affords is still lessened by the tious little variety of measure which the great fimilarity of them by their own: which accounts for the strange the terminations of the words occasions. Hence it happens, that this language is fitted for excelling in logy we meet with in the Italian as well as Spanish fewer branches of literature than almost any other: and French languages. The idiom of all the Gothic and although we have excellent historians, and more languages is purely analogous; and in all probability, than ordinary poets, in Italian, yet they labour under

great

om and

The excel-

tongue.

Language, great inconveniences, from the language wanting nerves and stateliness for the former, and sufficient variety of modulation for the latter. It is, more particularly on this account, altogether unfit for an epic poem; and though attempts have been made in this way by two men whose genius, if not fettered by the language, might have been crowned with fuccess; yet these, notwithstanding the fame that with some they may have acquired, must, in point of poetic harmony, be deemed defective by every impartial person. Nor is it possible that a language which hardly admits of poetry without rhime, can ever be capable of producing a perfect poem of great length; and the stanza to which their poets have ever confined themselves, must always produce the most disagreeable effect in a poem where unrestrained pomp or pathos are necessary qualifications. The only species of poetry in which the Italian language can claim a superior excellence, is the tender tone of elegy: and here it remains unrivalled and alone; the plaintive melody of the founds, and fmooth flow of the language, being perfectly adapted to express that foothing melancholy which this species of poetry requires. On this account the plaintive scenes of the Pastor Fido of Guarini have justly gained to that poem an universal applause; although, unless on this account alone, it is perhaps inferior to almost every other poem of the kind which ever appeared .-We must observe with surprise, that the Italians, who have fettered every other species of poetry with the feverest shackles of rhime, have in this species showed an example of the most unrestrained freedom; the happy effects of which ought to have taught all Europe the powerful charms attending it : yet with amazement we perceive, that fcarce an attempt to imitate them has been made by any poet in Europe except by Milton in his Lycidas; no dramatic poet, even in Britain, having ever adopted the unrestrained harmony of numbers to be met with in this and many other of their best dramatic compositions.

Of all the languages which sprung up from the mixlency of ture of the Latins with the northern people on the destruction of the Roman empire, none of them approach fo near to the genius of the Latin as the Spanish does. For as the Spaniards have been always remarkable for their military prowess and dignity of mind, their language is naturally adapted to express ideas of that kind. Sonorous and folemn, it admits nearly of as much dignity as the Latin. For conversation, it is the most elegant and courteous language in Europe.

The humane and generous order of chivalry was first invented, and kept its footing longest, in this nation; and although it run at last into such a ridiculous excess as deservedly made it fall into universal disrepute, yet it left fuch a strong tincture of romantic heroism upon the minds of all ranks of people, as made them jealous of their glory, and strongly emulous of cultivating that heroic politeness, which they considered as the highest perfection they could attain. Every man disdained to flatter, or to yield up any point of honour which he possessed; at the same time, he rigorously exacted from others all that was his due. These circumstances have given rise to a great many terms of respect, and courteous condescension, without meanness or flattery, which give their dialogue a respectful politeness and elegance unknown to any other

European language. This is the reason why the cha- Language. racters fo finely drawn by Cervantes in Don Quixotte are still unknown to all but those who understand the language in which he wrote. Nothing can be more unlike the gentle meekness and humane heroism of the knight, or the native simplicity, warmth of affection. and respectful loquacity of the squire, than the inconfiftent follies of the one, or the impertinent forwardness and difrespectful petulance of the other, as they are exhibited in every English translation. Nor is it, as we imagine, possible to represent so much familiarity, united with fuch becoming condescension in the one, and unfeigned deference in the other, in any other European language, as is necessary to paint these two admirable characters.

Although this language, from the folemn dignity and majestic elegance of its structure, is perhaps better qualified than any other modern one for the fublime strains of epic poetry; yet as the poets of this nation. have all along imitated the Italians by a most fervile subjection to rhime, they never have produced one poem of this fort, which in point of poely of ftyle deferves to be transmitted to posterity. And in any other species of poetry but this, or the higher tragedy, it is not naturally fitted to excel. But although the drama and other polite branches of literature were early cultivated in this country, and made confiderable progress in it, before the thirst of gain debased their fouls, or the defire of univerfal dominion made them forfeit that liberty which they once fo much prized; fince they became enervated by an overbearing pride, and their minds enflaved by superstition, all the polite arts have been neglected: fo that, while other European nations have been advancing in knowledge, and improving their language, they have remained in a state of torpid inactivity; and their language has not arrived at that perfection which its nature would admit, or the acute genius of the people might have made us naturally expect.

It will perhaps by some be thought an unpardon- The French It will perhaps by some be thought an unpartion the reachest able insult, if we do not allow the French the prefe- language rence of all modern languages in many respects. But dignity and fo far must we pay a deference to truth, as to be obli- energy; but ged to rank it among the poorest languages in Europe. Every other language has fome founds which can be uttered clearly by the voice: even the Italian, although it wants energy, still possesses distinctness of articulation. But the French is almost incapable of either of these beauties; for in that language the vowels are fo much curtailed in the pronunciation, and the words run into one another in fuch a manner, as neceffarily to produce an indistinctness which renders it incapable of measure or harmony. From this cause, it is in a great measure incapable of poetic modulation, and rhime has been obliged to be substituted in its ftead; fo that this poorest of all contrivances which has ever yet been invented to diftinguish poetry from profe, admitted into all the modern languages when ignorance prevailed over Europe, has still kept some footing in the greatest part of these, rather through a deference for established customs than from any necesfity. Yet as the French language admits of fo little poetic modulation, rhime is in fome meafure necessary to it; and therefore this poor deviation from profe has been adopted by it, and dignified with the name of Poe-

as to be absolutely unfit for almost every species of mufical composition (F); yet the sprightly genius of

that volatile people has been able to furmount all thefe

Language. Fry. But by their blind attachment to this artifice, tute of poetic harmony, and so much cramped in found Language. the French have neglected to improve fo much as they might have done the fmall powers for harmony of which their language is possessed; and by being long accustomed to this false taste, they have become fond of it to fuch a ridiculous excess, as to have all their tragedies, nay even their comedies, in rhime. While the poet is obliged to enervate his language, and check the flow of composition, for the fake of linking his lines together, the judicious actor finds more difficulty in destroying the appearance of that measure, and preventing the clinking of the rhimes, than in all the reft of his task .- After this, we will not be surprised to find Voltaire attempt an epic poem in this species of poetry; although the more judicious Fenelon in his Telemague had shown to his countrymen the only species of poefy that their language could admit of for any poem which aspired to the dignity of the epic strain .- Madam Deshouliers, in her Idyllie, has shown the utmost extent of harmony to which their language can attain in fmaller poems: indeed in the tenderness of an elegy, or the gaiety of a fong, it may succeed; but it is so destitute of force and energy, that it can never be able to reach the pindaric, or even perhaps the lyric strain, -as the ineffectual efforts even of the harmonious Rouffeau, in his translation of the Pfalms of David of this stamp, may fully convince us.

With regard to its powers in other species of composition, the sententious rapidity of Voltaire, and the more nervous dignity of Rouffeau, afford us no fmall prefumption, that, in a skilful hand, it might acquire fo much force, as to transmit to futurity historical facts in a ftyle not altogether unworthy of the subject. In attempts at pathetic declamation, the superior abilities of the compofer may perhaps on fome occasions excite a great idea; but this is ever cramped by the genius of the language: and although no nation in Europe can boast of so many orations where this grandeur is attempted; yet perhaps there are few who cannot produce more perfect, although not more laboured,

compositions of this kind. But notwithstanding the French language labours under all these inconveniences; although it can neither equal the dignity or genuine politeness of the Spanish, the nervous boldness of the English, nor the melting foftness of the Italian; although it is desti-

difficulties, and render it the language most generally esteemed, and most universally spoken, of any in Eu-Admirably rope; for this people, naturally gay and loquacious, fitted for and fond to excels of those superficial accomplishments which engage the attention of the fair fex, have invented fuch an infinity of words capable of expressing vague and unmeaning compliment, now dignified by the name of politeness, that, in this strain, one who uses the French can never be at a loss; and as it is easy to converse more, and really say less, in this than in any other language, a man of very moderate talents may diftinguish himself much more by using this than any other that has ever yet been invented. On this account, it is peculiarly well adapted to that species of conversation which must ever take place in those general and promiscuous companies, where many persons of both fexes are met together for the purposes of relaxation or amusement; and must of course be naturally admitted into the courts of princes, and affemblics of

great personages; who, having fewer equals with whom

they can affociate, are more under a necessity of con-

verfing with ftrangers, in whose company the tender

stimulus of friendship does not so naturally expand

the heart to mutual trust or unrestrained considence,

In these circumstances, as the heart remaineth difen-

gaged, conversation must necessarily slag; and mankind in this fituation will gladly adopt that language

in which they can converse most easily without being deeply interested. On these accounts the French now

is, and probably will continue to be, reckoned the

most polite language in Europe, and therefore the

most generally studied and known : nor should we

envy them this distinction, if our countrymen would

not weaken and enervate their own manly language.

by adopting too many of their unmeaning phrases. The English is perhaps possessed of a greater de-The excelgree of excellence, blended with a greater number of lencies and defects, than any of the languages we have hitherto defects of defects, than any of the languages we have muletone at the Engmentioned. As the people of Great Britain are a the Engmentioned. bold, daring, and impetuous race of men, fubject to ftrong passions, and, from the absolute freedom and

independence which reigns amongst all ranks of people throughout

⁽F) An author of great discernment, and well acquainted with the French language, has lately made the same remark; and as the loftiness of his genius often prevents him from bringing down his illustrations to the level of ordinary comprehension, he has on this and many other occasions been unjustly accused of being fond of paradoxes. - But as music never produces its full effect but when the tones it assumes are in unifon with the idea that the words naturally excite, it of necessity follows, that if the words of any language do not admit of that fulness of found, or that species of tones, which the passion or affection that may be described by the words would naturally require to excite the fame idea is the mind of one who was unacquainted with the language, it will be impossible for the music to produce its full effect, as it will be cramped and confined by the found of the words ; - and as the French language does not admit of those full and open founds which are necessary for pathetic expression in music, it must of course be unfit for musical composition. - It is true indeed, that in modern times, in which to little attention is bestowed on the simple and sublime charms of pathetic expression, and a fantastical tingling of unmeaning sounds is called music where the sease of the words are loft in fugues, quavers, and unnecessary repetition of particular fyllables, -all languages are nearly fitted for it; and among these the French: nor is it less to be doubted, that, in the easy gaiety of a song, this language can properly enough admit of all the mufical expression which that species of composition may require.

Language throughout this happy ifle, little folicitous about controlling these passions :- our language takes its strongest characteristical distinction from the genius of the people; and, being bold, daring, and abrupt, is admirably well adapted to express those great emotions which fpring up in an intrepid mind at the profpect of interesting events. Peculiarly happy too in the full and open found of the vowels, which forms the characteristic tone of the language, and in the strong use of the aspirate H in almost all those words which are used as exclamations, or marks of strong emotions upon interesting oceasions, that particular class of words called interjections have, in our language, more of that fulness and unrestrained freedom of tones, in which their chief power confifts, and are pushed forth from the inmost recesses of the foul in a more forcible and unrestrained manner, than any other language whatever. Hence it is more peculiarly adapted for the great and interesting scenes of the drama than any language that has yet appeared on the globe. Nor has any other nation ever arrived at that perfection which the English may justly claim in that respect; for however faulty our dramatic compositions may be in some of the critical niceties which relate to this art, -in nervous force of diction, and in the natural expression of those great emotions which constitute its foul and energy, we claim, without dispute, an unrivalled fuperiority. Our language too, from the great intercourse that we have had with almost all the nations of the globe by means of our extensive commerce, and from the eminent degree of perfection which we have attained in all the arts and sciences, has acquired a copiousness beyond what any other modern language can lay claim to: and even the most partial favourers of the Greek language are forced to acknowledge, that in this respect it must give place to the English. Nor is it less happy in that facility of conflruction which renders it more peculiarly adapted to the genius of a free people, than any other form of language. Of an idiom purely analogous, it has deviated less from the genius of that idiom, and possesses more of the characteristic advantages attending it than any other language that now exists: for, while others, perhaps by their more intimate connection with the Romans, have adopted some of their transpositions; and clogged their language with unnecessary fetters, we have preserved ourselves free from the contagion, and ftill retain the primitive simplicity of our language. Our verbs are all varied by auxiliaries (except in the inflance we have already given, which is so much in our favour); our nouns remain free from the perplexing embarraffment of genders, and our pronouns mark this diffinction where necessary with the most perfect accuracy; our articles also are of course freed from this unnatural encumbrance, and our adjectives preferve their natural freedom and independence. From these causes, our language follows an order of construction so natural and easy, and the rules of fyntax are so few and obvious, as to be within the reach of the most ordinary capacity. So that from this, and the great clearness and diffinctness of meaning with which this mode of conftruction is necessarily accompanied, it is much better adapted for the familiar intercourse of private fociety, and liable to fewer errors in ufing it,

than any other language yet known; and on this ac- Language, count we may boaft, that in no nation of Europe do the lower class of people speak their language with fo much accuracy, or have their minds fo much enlightened by knowledge, as in Great Britain .-What then shall we say of the discernment of those grammarians, who are every day echoing back to one another complaints of the poverty of our language on account of the few and simple rules which it requires in fyntax? As justly might we complain of an invention in mechanics, which, by means of one or two fimple movements, obvious to an ordinary capacity, little liable to accidents, and eafily put in order by the rudest hand, should possess the whole powers of a complex machine, which had required an infinite apparatus of wheels and contrary movements, the knowledge of which could only be acquired, or the various accidents to which it was exposed by using it be repaired, by the powers of an ingenious artift, as complain of this characteristic excellence of our language as a defect.

But if we thus enjoy in an eminent degree the advantages attending an analogous language, we likewife feel in a confiderable measure the defects to which it is exposed; as the number of monofyllables with which it always must be embarrassed, notwithstanding the great improvements which have been made in our language fince the revival of letters in Europe, prevents in some degree that swelling fulness of found which so powerfully contributes to harmonious dignity and graceful cadences in literary compositions. And as the genius of the people of Britain has always been more disposed to the rougher arts of command than to the fofter infinuations of perfuation, no pains have been taken to correct these natural defects of our language : but, on the contrary, by an inattention of which we have hardly a parallel in the history of any civilized nation, we meet with many inflances, even within this last century, of the harmony of found being facrificed to that brevity so defirable in conversation, as many elegant words have been curtailed, and harmonious fyllables suppressed, to substitute in their stead others. shorter indeed, but more barbarous and uncouth. Nav. fo little attention have our forefathers bestowed upon the harmony of founds in our language, that one would be tempted to think, on looking back to its primitive flate, that they had on fome occasions studiously debased it. Our language, at its first formation, seems to have laboured under a capital defect in point of found, as fuch a number of S's enter into the formation of our words, and fuch a number of letters and combinations of other letters assume a similar found, as to give a general his through the whole tenor of our language, which must be exceedingly disagreeable to every unprejudiced ear. We would therefore have naturally expected, that at the revival of letters, when our forefathers became acquainted with the harmonious languages of Greece and Rome, they would have acquired a more correct tafte, and endeavoured, if possible, to diminish the prevalence of this disgusting found. But fo far have they been from thinking of this, that they have multiplied this letter exceedingly. The plurals of almost all our nouns were originally formed by adding the harmonious fyllable en to the fingular

Language fingular, which has given place to the letter s; and in verification, unknown to the ancients, has been Language. instead of bousen formerly, we now fay bouses. In like manner, many of the variations of our verbs were formed by the fyllable eth, which we have likewife changed into the fame difagreeable letter; fo that, instead of loveth, moveth, writeth, walketh, &c. we have changed them into the more modifi form of loves, moves, writes, walks, &c. Our very auxiliary verbs have fuffered the fame change; and instead of hath and doth, we now make use of has and does. From these causes, notwithstanding the great improvements which have been made in language, within thefe few centuries, in other respects; yet, with regard to the pleasingness of found alone, it was perhaps much more perfect in the days of Chaucer than at prefent : and although custom may have rendered these founds so familiar to our ear, as not to affect us much: vet to an unprejudiced person, unacquainted with our language, we have not the imallest doubt but the language of Bacon or Sidney would appear more harmonious than that of Robertson or Hume. This is indeed the fundamental defect of our language, and loudly calls for reformation.

But notwithstanding this great and radical defect with regard to pleafingness of founds, which must be so strongly perceived by every one who is unacquainted with the meaning of our words; yet to those who understand the language, the exceeding copiousnefs which it allows in the choice of words proper for the occasion, and the nervous force which the perspicuity and graceful elegance the emphasis bestows upon it, makes this defect be totally overlooked; and we could produce fuch numerous works of profe, which excel in almost every different style of composition, as would be tirefome to enumerate: every reader of tafte and differnment will be able to recollect a fufficient number of writings which excel in point of flyle, between the graceful and becoming gravity fo conspicuous in all the works of the author of the Whole Duty of Man, and the animated and nervous diction of Robertfon in his Hiftory of Charles the Fifth, - the more flowery fivle of Shaftesbury, or the Attic simplicity and elegance of Addison. But although we can equal, if not furpals, every modern language in works of profe, it is in its poetical powers that our language shines forth with the greatest lustre. The brevity to which we must here necessarily confine ourselves, prevents us from entering into a minute examination of the poetical powers of our own, compared with other languages; otherwife it would be easy to show, that every other modern language labours under great reftraints in this respect which ours is freed from ;- that our language admits of a greater variety of poetic movements, and divertity of cadence, than any of the admired languages of antiquity; that it diftinguishes with the greatest accuracy between accent and quantity, and is possessed of every other poetic excellence which their languages were capable of : fo that we are possessed of all the sources of harmony which they could boaft; and, befides all thefe, have one fuperadded, which is the cause of greater variety and more forcible expression in numbers than all the rest; that is, the unlimited power given by the emphalis over quantity and cadence; by means whereof, a necessary union between found and fense, numbers and meaning,

brought about, which gives our language in this refpect a superiority over all those justly admired languages. But as we cannot here further purfue this fubject, we shall only observe, that these great and diffinguishing excellencies far more than counterbalance the inconveniences that we have already mentioned: and although, in mere pleafantness of founds, or harmonious flow of fyllables, our language may be inferior to the Greek, the Latin, Italian, and Spanish; yet in point of manly dignity, graceful variety, intuitive diffinctness, nervous energy of expression, unconftrained freedom and harmony of poetic numbers, it will yield the palm to none. Our immortal Milton, flowly rifing, in graceful majefty flands up as equal, if not fuperior in these respects to any poet, in any other language, that ever yet existed ;-while Thomson, with more humble aim, in melody more smooth and flowing, foftens the foul to harmony and peace :- the plaintive moan of Hammond calls forth the tender tear and fympathetic figh; while Grav's more foothing melancholy fixes the fober mind to filent contemplation :- more tender fill than thefe, the amiable Shenfton comes; and from his Doric reed, still free from courtly affectation, flows a strain to pure fo fimple, and of fuch tender harmony, as even Arcadian shepherds would be proud to own. But far before the reft, the daring Shakespeare steps forth conspicuous, clothed in native dignity; and, preffing forward with unremitting ardour, boldly lays claim to both dramatic crowns held out to him by Thalia and Melpomene:-his rivals, far behind, look up, and envy him for these unfading glories; and the attonished nations round, with diffant awe, behold and tremble at his daring flight. --- Thus the language, equally obedient to all, bends with ease under their hands, whatever form they would have it assume; and, like the vielding wax, readily receives, and faithfully transmits to posterity, those impressions which they have stamped upon it.

Such are the principal outlines of the language of Great Britain, fuch are its beaucies, and fuch its most capital defects; a language more peculiarly circumstanced than any that has ever yet appeared .- It is the language of a great and powerful nation, whose fleets furround the globe, and whose merchants are in every port; a people admired or revered by all the world :- and yet it is less knowue in every foreign country than many of the other languages in Europe. In it are written more perfect treatifes on every art and fcience than are to be found in any other language ;yet it is less sought after or effeemed by the literati in any part of the globe than almost any of these. Its fuperior powers for every purpose of language are sufficiently obvious from the models of perfection in almost every particular which can be produced in it :yet it is neglected, despised, and vilified by the people who use it; and many of those authors who owe almost the whole of their fame to the excellence of the language in which they wrote, look upon that very language with the highest contempt. Neglected and despised, it has been trodden under foot as a thing altogether unworthy of cultivation or attention. Yet in spite of all these inconveniences, in spite of the many wounds it has thus received, it still holds up its

Elements of Crit.

Language, head, and preferves evident marks of that comeliness which diminisheth in appearance the size of every ob. Language. Like a healthy oak planted in a rich and fertile foil. it has fprung up with vigour: and although neglected, and fuffered to be over-run with weeds; although exposed to every blaft, and unprotected from every violence; it still beareth up under all these inconveniences, and shoots up with a robust healthiness and wild luxuriance of growth. Should this plant, fo found and vigorous, be now cleared from those weeds with which it has been fo much encumbered ;- should every obstacle which now buries it under thich shades, and hides it from the view of every passenger, be cleared away ;- fhould the foil be cultivated with care, and a ftrong fence be placed around it, to prevent the idle or the wicked from breaking or difforting its branches;who can tell with what additional vigour it would flourish, or what amazing magnitude and perfection it might at last attain !- How would the astonished world behold, with reverential awe, the majeftic gracefulness of that object which they so lately despised!

Beauty of LANGUAGE confidered in regard to Composition. The beauties of language may be divided into three classes: 4. Those which arise from found: 2. Those which respect fignificance; 3. Those derived from a refemblance between found and fignification.

I. With respect to sound. In a cursory view, one would imagine, that the agreeableness or disagreeableness of a word with respect to found, should depend upon the agreeableness or disagreeableness of its component fyllables: which is true in part, but not entirely; for we must also take under consideration the effect of fyllables in fuccession. In the first place, fyllables in immediate fuccession, pronounced each of them with the fame, or nearly the fame, aperture of the mouth, produce a fuccession of weak and feeble founds; witness the French words dit il, pathetique : on the other hand, a fyllable of the greatest aperture succeeding one of the fmalleft, or the contrary, makes a fuccession which, because of its remarkable difagreeableness, is diftinguished by a proper name, viz. biatus. The most agreeable succession is, where the cavity is increased and diminished alternately, within moderate limits: examples, Alternative, longevity, pufillanimous. Secondly, words confifting wholly of fyllables pronounced flow, or of fyllables pronounced quick, commonly called long and foort fyllables, have little melody in them; witness the words petitioner, fruiterer, dizziness: on the other hand, the intermixture of long and fhort fyllables is remarkably agreeable ; for example, degree, repent, wonderful, altitude, rapidity, independent, impetuofity; the cause of which is explained in POETRY, Part II.

To proceed to the music of periods. As the arrangement of words in fuccession, so as to afford the preatest pleasure to the ear, depends on principles remote from common view, it will be necessary to premife fome general observations upon the appearance that objects make when placed in an increasing or decreafing feries; which appearance will vary according to the prevalence of refemblance or of contrast. Where the objects vary by fmall differences fo as to have a mutual refemblance, we in afcending conceive the fecond object of no greater fize than the first, the third of no greater fize than the fecond, and fo of the reft;

and vigour which are its characteristical distinction. ject except the first : but when beginning at the greatest object, we proceed gradually to the leaft, refemblance makes us imagine the fecond as great as the first, and the third as great as the second; which in appearance magnifies every object except the first. On the other hand, in a feries varying by large differences, where contrast prevails, the effects are directly oppofite : a great object fucceeding a fmall one of the fame kind, appears greater than ufual; and a little object fucceeding one that is great, appears less than usual 1. | See Re-Hence a remarkable pleasure in viewing a series ascend-semblance. ing by large differences; directly opposite to what we feel when the differences are small. The least object of a feries afcending by large differences has the fame effect upon the mind as if it flood fingle without making a part of the feries : but the fecond object, by means of contrast, appears greater than when viewed fingly and apart; and the effect is perceived in afcending progressively, till we arrive at the last object. The opposite effect is produced in descending; for in this direction, every object, except the first, appears less than when viewed feparately and independent of the feries. We may then assume as a maxim, which will hold in the composition of language as well as of other fubjects, That a strong impulse succeeding a weak, makes a double impression on the mind; and that a weak impulse succeeding a strong, makes scarce any impression.

After establishing this maxim, we can be at no loss about its application to the subject in hand. The following rule is laid down by Diomedes t. " In verbis + De Aruel. observandum est, ne a majoribus ad minora descendat perseda oratio; melius enim dicitur, Vir eft optimus, quam, orat. lib. ii. Vir optimus eft." This rule is also applicable to entire members of a period, which, according to our author's expression, ought not, more than single words, to proceed from the greater to the less, but from the less to the greater. In arranging the members of a period, no writer equals Cicero: The following ex-

Quicum quæftor fueram,

Quicum me fors confuetudoque majorum, Quicum me deorum hominumque judicium conjunxerat-

amples are too beautiful to be flurred over by a refe-

Again :

Habet honorem quem petimus,

Habet spem quam præpositam nobis habemus,

Habet existimationem, multo sudore, labore, vigiliifque, collectam.

Again:

Eripite nos ex miferiis, Eripite nos ex faucibus corum,

Quorum crudelitas nostro fanguine non potest expleri-De oratore, 1. 1. § 52.

This order of words or members gradually increasing in length, may, fo far as concerns the pleafure of found, be denominated a climax in found,

With respect to the music of periods as united in a discourse this depends chiefly on variety. Hence a rule for arranging the members of different periods

Language. with relation to each other, That to avoid a tedious uniformity of found and cadence, the arrangement, the cadence, and the length of the members, ought to be diversified as much as possible : and if the members of different periods be fufficiently diverlified, the periods themselves will be equally so.

II. With respect to fignification. The beauties of language with respect to fignification, may not improperly be diftinguished into two kinds: first, the beauties that arife from a right choice of words or materials for constructing the period; and next, the beauties that arise from a due arrangement of these words

or materials.

1. Communication of thought being the chief end of language, it is a rule, That perspicuity ought not to be facrificed to any other beauty whatever. Nothing therefore in language ought more to be studied, than to prevent all obscurity in the expression; for to have no meaning, is but one degree worse than to have a meaning that is not understood. We shall here give a few examples where the obscurity arises from a wrong choice of words.

Livy, fpeaking of a rout after a battle, " Multique in ruina majore quam fuga oppressi obtruncatique." This author is frequently obscure by expressing but part of his thought, leaving it to be completed by his reader. His description of the sea-fight, l. 28. cap. 30.

is extremely perplexed.

Unde tibi reditum certo subtemine Parcæ Hor. Rupere. Qui perfæpe cava testudine slevit amorem, Non elaboratum ad pedem. Me fabulofæ Vulture in Appulo,

Altricis extra limen Apulia, Ludo, fatigatumque fomno, Fronde nova puerum palumbes Texere.

Puræ rivus aquæ, filvaque jugerum Paucorum, et segetis certa fides meæ, Fulgentem imperio fertilis Africæ Fallit forte beatior. Id.

Cum fas atque nefas exiguo fine libidinum Difcernunt avidi.

Ac fpem fronte ferenat.

The rule next in order is, That the language ought to correspond to the fubject : heroic actions or feutiments require elevated language; tender fentiments ought to be expressed in words fest and slowing; and plain language void of ornament, is adapted to subjects grave and didactic. Language may be confidered as the dress of thought; and where the one is not fuited to the other, we are fenfible of incongruity, in the fame manner as where a judge is dreffed like a fop, or a peafant like a man of quality. Where the impression made by the words refembles the impression made by the thought, the fimilar emotions mix fweetly in the mind, and double the pleafure; but where the impressions made by the thought and the words are diffimilar, the unnatural union they are forced into is difagreeable.

words has been observed by every critic, and is so Language. well understood as not to require any illustration. But there is a concordance of a peculiar kind that has fearcely been touched in works of criticism, though it contributes to neatness of composition. It is what

In a thought of any extent, we commonly find fome parts intimately united, some slightly, some disjoined, and some directly opposed to each other. To find these conjunctions and disjunctions imitated in the expression. is a beauty; because such imitation makes the words concordant with the sense. This doctrine may be illustrated by a familiar example: When we have occafion to mention the intimate connection that the foul hath with the body, the expression ought to be, the foul and body; because the article the, relative to both, makes a connection in the expression, resembling in fome degree the connection in the thought : but when the foul is diffinguished from the body, it is better to fay the foul and the body; because the disjunction in the words refembles the disjunction in the thought. We proceed to other examples, beginning with conjunctions.

" Constituit agmen ; et expedire tela animosque, equitibus juffis," &c. Livy, 1. 38. 6 25. Here the words that express the connected ideas are artificially connected by fubjecting them both to the regimen of one verbs And the two following are of the same kind.

" Quum ex paucis quotidie aliqui eorum caderent aut vulnerarentur, et qui superarent, fessi et corporibus

et animis effent," &c. Ibid. 6 20.

Post acer Mnestheus adducto constitit arcu. Alta petens, pariterque oculos telumque tetendit. Eneid, v. 507.

But to justify this artificial connection among the words, the ideas they express ought to be intimately connected; for otherwife that concordance which is required between the fenfe and the expression will be impaired. In that view, the following paffage from Tacitus is exceptionable; where words that fignify ideas very little connected, are however forced into an artificial union. "Germania omnis a Gallis, Rhætiifque, et Pannoniis, Rheno et Danubio fluminibus; a Sarmatis Dacisque, mutuo metu aut montibus feparatur."

Upon the fame account, the following paffage feems

equally exceptionable.

Id.

-The fiend look'd up, and knew His mounted feale aloft; nor more, but fled Murm'ring, and with him fled the shades of night. Paradife Loft, B. iv. at the end.

There is no natural connection between a person's flying or retiring, and the fuccession of day-light to darkness; and therefore to connect artificially the terms that fignify thefe things cannot have a fweet effect.

Two members of a thought connected by their relation to the fame action, will naturally be expressed by two members of the period governed by the fame verbs in which case these members, in order to improve their connection, ought to be constructed in the same manner. This beauty is fo common among good writers. as to have been little attended to; but the neglect of This concordance between the thought and the it is remarkably difagreeable: for example, "He did Language, not mention Leonora, nor that her father was dead. Better thus: " He did not mention Leonora, nor her father's death."

Where two ideas are so connected as to require but a conpulative, it is pleafant to find a connection in the words that express these ideas, were it even so slight as where both begin with the fame letter. Thus,

"The peacock, in all his pride, does not display half the colour that appears in the garments of a British lady, when the is either dreffed for a ball or a birth-

" Had not my dog of a steward run away as he did, without making up his accounts, I had still been immerfed in fin and fea-coal." Ib.

My life's companion, and my bosom-friend, One faith, one fame, one fate shall both attend. Dryden, Translation of Eneid.

Next as to examples of disjunction and opposition in the parts of the thought, imitated in the expression; an imitation that is diftinguished by the name of anti-

Speaking of Coriolanus foliciting the people to be made conful:

With a proud heart he wore his humble weeds. Coriolanus.

" Had you rather Cæfar were living, and die all flaves, than that Cæfar were dead, to live all free men?" Julius Cafar.

He hath cool'd my friends and heated mine enemies. Shakespeare.

An artificial connection among the words, is undoubtedly a beauty when it represents any peculiar connection among the conftituent parts of the thought; but where there is no fuch connection, it is a politive deformity, because it makes a discordance between the thought and expression. For the same reason, we ought also to avoid every artificial opposition of words where there is none in the thought. This laft, termed verbal antithefis, is studied by low writers, because of a certain degree of liveliness in it. They do not consider how incongruous it is, in a grave composition, to cheat the reader, and to make him expect a contrast in the thought, which upon examination is not found there.

A fault directly opposite to the last mentioned, is to conjoin artificially words that express ideas opposed to each other. This is a fault too gross to be in common practice; and yet writers are guilty of it in some degree, when they conjoin by a copulative things transacted at different periods of time. Hence a want of neatness in the following expression: " The nobility too, whom the king had no means of retaining by fuitable offices and preferments, had been feized with the general discontent, and unwarily threw themselves into the scale which began already too much to preponderate." Hume. In periods of this kind, it appears more neat to express the past time by the participle passive, thus: "The nobility having been seized with the general discontent, unwarily threw themselves," &c. or, "The nobility, who had been feized, &c. unwarily threw themselves," &c.

It is unpleasant to find even a negative and affirmative proposition connected by a copulative:

Nº 174.

If it appear not plain, and prove untrue, Deadly divorce ttep between me and you.

Shake Speare.

Language,

In mirth and drollery it may have a good effect to connect verbally things that are opposite to each other in the thought. Example : Henry IV. of France introducing the Mareschal Biron to some of his friends,

" Here, gentlemen (fays he) is the Mareschal Biron, whom I freely present both to my friends and

This rule of fludying uniformity between the thought and expression may be extended to the construction of fentences or periods. A fentence or period ought to express one entire thought or mental proposition: and different thoughts ought to be separated in the expression by placing them in different sentences or periods. It is therefore offending against neatness, to crowd into one period entire thoughts requiring more than one; which is joining in language things that are separated in reality. Of errors against this rule take the following examples.

" Behold, thou art fair, my beloved, yea pleafant :

also our bed is green."

Burnet, in the history of his own times, giving Lord Sunderland's character, fays; "His own notions were always good; but he was a man of great expence."

" I have feen a woman's face break out in heats, as she has been talking against a great lord, whom she had never feen in her life; and indeed never knew a party-woman that kept her beauty for a twelvemonth." Spea.

Lord Bolingbroke, speaking of Strada: " I fingle him out among the moderns, because he had the foolish prefumption to cenfure Tacitus, and to write history himself; and your lordship will forgive this short excursion in honour of a favourite writer."

To crowd into a fingle member of a period different fubjects, is still worse than to crowd them into one

period:

- Trojam genitore Adamasto Paupere (manfiffetque utinam fortuna) profectus. Æneid iii. 614.

From conjunctions and disjunctions in general, we proceed to comparisons, which make one species of them, beginning with fimilies. And here also, the intimate connection that words have with their meaning requires, that in describing two resembling objects, a refemblance in the two members of the period ought to be studied. To begin with examples of refemblances expressed in words that have no resemblance.

"I have observed of late, the flyle of some great ministers very much to exceed that of any other productions." Swift. This, inflead of fludying the refemblance of words in a period that expresses a comparison, is going out of one's road to avoid it. Inflead of productions, which refemble not ministers great nor small, the proper word is writers or authors.

" I cannot but fancy, however, that this imitation, which paffes fo currently with other judgments, must at fome time or other have fluck a little with your lord-Shaftesb. Better thus: " I cannot but fancy, however, that this imitation, which passes so currently with others, must at some time or other have stuck a little with your lordsbip."

66 A.

" A glutton or mere fenfualist is as ridiculous as the other two characters." Id.

"They wifely prefer the generous efforts of goodwill and affection, to the reluctant compliances of fuch as obey by force." Bolingb.

It is a still greater deviation from congruity, to af-

fect not only variety in the words, but also in the conflruction. Hume fpeaking of Shakespeare: "There may re-

main a fuspicion that we over-rate the greatness of his genius, in the fame manner as bodies appear more gigantic on account of their being difproportioned and mishapen." This is studying variety in a period where the beauty lies in uniformity. Better thus: "There may remain a suspicion that we over-rate the greatness of his genius, in the same manner as we over-rate the greatness of bodies that are disproportioned and mishapen."

Next of comparison where things are opposed to each other. And here it must be obvious, that if refemblance ought to be fludied in the words which express two resembling obsects, there is equal reason for fludying opposition in the words which express contrafted objects. This rule will be beft illustrated by

examples of deviations from it.

"A friend exaggerates a man's virtues; an enemy inflames his crimes." Spea. Here the opposition in the thought is neglected in the words; which at first view feem to import, that the friend and enemy are employed in different matters, without any relation to each other, whether of refemblance or of opposition. And therefore the contrast or opposition will be better marked by expressing the thought as follows: " A friend exaggerates a man's virtues, an enemy his crimes."

"The wife man is happy when he gains his own approbation; the fool when he recommends himself to the applause of those about him." Ib. Better: "The wife man is happy when he gains his own approbation, the fool when he gains that of others."

We proceed to a rule of a different kind. During the course of a period, the scene ought to be continued without variation: the changing from perfon to perfon, from subject to subject, or from person to subject, within the bounds of a fingle period, diffracts the mind, and affords no time for a folid impression.

Hook, in his Roman history, speaking of Eumenes, who had been beat to the ground with a stone, favs, " After a short time he came to himself; and the next day they put him on board his thip, which conveyed him first to Corinth, and thence to the island of Æ-

gina.'

The following period is unpleafant, even by a very flight deviation from the rule : " That fort of instruction which is acquired by inculcating an important moral truth," &c. This expression includes two perfons, one acquiring, and one inculcating; and the fcene is changed without necessity. To avoid this blemish, the thought may be expressed thus: " That fort of instruction which is afforded by inculcating,"

The bad effect of fuch a change of person is remarkable in the following paffage: " The Britons, daily haraffed by cruel inroads from the Picts, were forced Vol. IX. Part II.

to call in the Saxons for their defence, who confequent Language, ly reduced the greatest part of the island to their own power, drove the Britons into the most remote and mountainous parts, and the rest of the country, in customs, religion, and language, became wholly Saxon."

The following passage has a change from subject to person: " This prostitution of praise is not only a deceit upon the gross of mankind, who take their notion of characters from the learned; but also the better fort must by this means lose some part at least of that defire of fame which is the incentive to generous actions, when they find it promiscuously bestowed on the meritorious and undeferving." Guardian, No 4.

The present head, which relates to the choice of materials, shall be closed with a rule concerning the use of copulatives. Longinus observes, that it animates a period to drop the copulatives; and he gives the following example from Xenophon: "Closing their shields together, they were push'd, they fought, they slew, they were flain." The reason may be what follows. A continued found, if not loud, tends to lay us afleep: an interrupted found roufes and animates by its repeated impulses: thus feet composed of syllables, being pronounced with a fenfible interval between each, make more lively impressions than can be made by a continued found. A period of which the members are connected by copulatives, produceth an effect upon the mind approaching to that of a continued found; and therefore the fuppressing copulatives must animate a description. It produces a different effect akin to that mentioned: the members of a period connected by proper copulatives, glide fmoothly and gently along; and are a proof of sedateness and leisure in the speaker: on the other hand, one in the hurry of passion, neglecting copulatives and other particles, expresses the principal image only; and for that reason, hurry or quick action is best expressed without copulatives :

Veni, vidi, vici.

Ferte citi flammas, date vela, impellite remos.

Quis globus, O cives, caligine volvitur atra? Ferte citi ferrum, date tela, scandite muros. Hostis adest, eja.

In this view Longinus juftly compares copulatives in a period to ftrait tying, which in a race obstructs the freedom of motion.

It follows, that a plurality of copulatives in the fame period ought to be avoided; for if the laying afide copulatives give force and liveliness, a redundancy of them must render the period languid. The following instance may be appealed to, though there are but two copulatives: "Upon looking over the letters of my female correspondents, I find several from women complaining of jealous husbands; and at the same time protesting their own innocence, and defiring my advice upon this occasion." Sped.

Where the words are intended to express the coldnefs of the speaker, there indeed the redundancy of copulatives is a beauty:

Dining one day at an alderman's in the city, Peter observed him expatiating after the manner of his bre 4 A 6 thren "thren in the prailes of his furton of beet. "Det
(faid the fage magifrate) is the king of meat: beef
comprehends in it the quinteffence of partridge, and
quail, and renifon, and pheafant, and plum-pudding,
and cutlard." Tale of a Tub. 6 4. And the author shows great delicacy of talle by varying the expreffion in the mouth of Peter, who is repredented more
animated: "Bread (fays he), dear brothers, is the
"that of life; in which bread is contained, inclusive,
the quinteffence of beef, mutton, veal, venifon, par-

"tridge, plum-pudding, and cuftard."

Another case muit alio be excepted. Copulatives have a good effect where the intention is to give an imperflion of a great multitude contiting of many divitions; for example: 'The army was compofed of Grecians, and Carians, and Lycians, and Pamphylians, and Phrygians.' The reafon is, that a leifurely furvey, which is expressed by the copulatives, makes the parts appear more numerous than they would do by a bastly furvey: in the latter case, the army appears in one group; in the former, we take as it were an accurate furvey of each nation, and of each division.

2. To pave the way for the rules of arrangement, it will be here necessary to explain the difference between a natural style and that where transposition or inverversion prevails. In a natural style, relative words are by juxtaposition connected with those to which they relate, going before or after, according to the peculiar genius of the language. Again, a circumstance councided by a preposition, follows naturally the word with which it is connected. But this arrangement may be varied, when a different order is more beautiful: a circumstance may be placed before the word with which it is connected by a preposition; and may be interjected even between a relative word and that to which it relates. When such liberties are frequently taken, the style becomes inverted or transposed.

But as the liberty of invertion is a capital point in the prefent fubjech, it will be necessary to examine it more narrowly, and in particular to trace the several degrees in which an inverted flyle recedes more and more from that which is natural. And first, as to the placing a circumstance before the word with which it is connected, this is the castlent of all invertion, even so casy as to be consistent with a style that is properly termed natural: witness the following examples.

"In the fincerity of my heart, I profess," &c.

"By our own ill management, we are brought to
fo low an ebb of wealth and credit, that," &c.

" On Thursday morning there was little or nothing

transacted in Change-alley.

"At St Bride's church in Fleetstreet, Mr Woolfton (who writ against the miracles of our Saviour), in the utmost terrors of conscience, made a public recantation."

The interjecting a circumflance between a relative word and that to which it relates, is more properly termed inverfon; becaule, by a disjunction of words intimately connected, it recedes farther from a natural flyle. But this licence has degrees; for the disjunction is more violent in fome cafes than in others.

In nature, though a subject cannot exist without its qualities, nor a quality without a subject; yet in our conception of these, a material difference may be remarked. We cannot conceive a quality but as belong-

which is formed of the subject. But the opposite holds not; for though we cannot form a conception of a fubject void of all qualities, a partial conception may be formed of it, abstracting from any particular quality: we can, for example, form the idea of a fine Arabian horse without regard to his colour, or of a white horse without regard to his fize. Such partial conception of a fubject is still more easy with respect to action or motion, which is an occasional attribute only. and has not the same permanency with colour or figure; we cannot form an idea of motion independent of a bedy: but there is nothing more easy than to form an idea; of a body at reft. Hence it appears, that the degree of invertion depends greatly on the order in which the related words are placed; when a fubstantive occupies the first place, the idea it suggests must subfift in the mind at least for a moment, independent of the relative words afterward introduced; and that moment may without difficulty be prolonged by interjecting a circumstance between the substantive and its connections. This liberty therefore, however frequent, will scarce alone be sufficient to denominate a style inverted. The case is very different, where the word that occupies the first place denotes a quality or an action; for as these cannot be conceived without a subject, they cannot without greater violence be separated from the fubject that follows; and for that reason, every such

feparation by means of an interjected circumflance belongs to an inverted ftyle.

To illustrate this doctrine, examples are necessary.
In the following, the word first introduced does not

imply a relation:

Hunger and thirst at once, Powerful persuaders, quicken'd at the scent Of that alluring fruit, urg'd me so keen.

Moon that now meet'st the orient sun, now sit'st With the fix'd stars, fixed in their orb that slies, And ye sive other wand'ring sires that move In mystic dance not without song, resound His praise.

Where the word first introduced imports a relations the disjunction will be found more violent:

Of man's first disobedience, and the fruit Of that forbidden tree, whose mortal taste Brought death into the world, and all our wo, With loss of Eden, till one greater man Restore us, and regain the blisful feat, Sing heav'nly muse.

Upon the firm opacous globe
Of this round world, whose first convex divides
The luminous inferior orbs, inclos'd
From chaos and th' inroad of darkness old,
Satan alighted walks.

On a fudden open fly, With impetuous recoil and jarring found, Th' infernal doors.

Wherein remain'd, For what could elfe? to our almighty foe Clear victory, to our part loss and rout.

Language

fined to the natural order of ideas: By inversion a be arranged thus: "A great stone that, after a long

relinquished in a natural arrangement.

Rules. 1. In the arrangement of a period, as well as in a right choice of words, the first and great object being perspicuity, the rule above laid down, that perspicuity ought not to be sacrificed to any other beauty, holds equally in both. Ambiguities occafioned by a wrong arrangement are of two forts; one where the arrangement leads to a wrong fenfe, and one where the fenfe is lefs doubtful. The first, being the more culpable, shall take the lead, beginning with examples of words put in a wrong place.

" How much the imagination of such a presence must exalt a genius, we may observe merely from the influence which an ordinary prefence has over men." Shaftefb. This arrangement leads to a wrong fense: the adverb merely feems by its position to affect the preceding word; whereas it is intended to affect the following words, an ordinary presence; and therefore the arrangement ought to be thus: " How much the imagination of such a presence must exalt a genius, we may observe from the influence which an ordinary prefence merely has over men." [Or better],-" which

even an ordinary presence has over men."

"Sixtus the Fourth was, if I miltake not, a great collector of books at least." Boling. The expression here leads evidently to a wrong fenfe; the adverb at leaft, ought not to be connected with the fubilantive books, but with collector, thus: " Sixtus the Fourth

was a great collector at leaft, of books."

Speaking of Louis XIV. "If he was not the greatest king, he was the best actor of majesty at least that ever filled a throne." Id. Better thus: " If he was not the greatest king, he was at least the best actor of majefly," &c. This arrangement removes the wrong fense occasioned by the juxtaposition of majesty and at leaft.

The following examples are of a wrong arrangement

of members.

" I have confined myfelf to those methods for the advancement of piety, which are in the power of a prince limited like ours by a flrict execution of the laws." Swift. The structure of this period leads to a meaning which is not the author's, viz. power limited by a ftrict execution of the laws. That wrong fense is removed by the following arrangement: " I have confined myfelf to those methods for the advancement of piety, which, by a firict execution of the laws, are in the power of a prince limited like ours."

"This morning, when one of lady Lizard's daughters was looking over fome hoods and ribbands brought by her tirewoman, with great care and diligence, I employed no less in examining the box which contained them." Guardian. The wrong fenfe occasioned by this arrangement, may be easily prevented by varying it thus: " This morning, when, with great care and diligence, one of Lady Lizard's daughters was looking over fome hoods and ribbands," &c.

" A great stone that I happened to find after a long fearch by the fea-shore, served me for an anchor." Swift. One would think that the fearch was confined to the fea-shore; but as the meaning is, that the great

Language would have no great power, were it con- stone was found by the sea-shore, the period ought to Language. thousand beauties may be compassed, which must be fearch, I happened to find by the sea-shore, served me for an anchor."

> Next of a wrong arrangement where the fense is left doubtful; beginning, as in the former fort, with examples of a wrong arrangement of words in a member.

"These forms of conversation by degrees multiplied and grew troublesome." Sped. Here it is left doubtful whether the modification by degrees relates to the preceding member or to what follows: it should be. " These forms of conversation multiplied by degrees."

" Nor does this false modesty expose us only to such actions as are indifcreet, but very often to fuch as are highly criminal." Speat. The ambiguity is removed by the following arrangement: " Nor does this falfe modesty expose us to such actions only as are indif-

creet," &c.

" The empire of Blefuscu is an island situated to the north-east fide of Lilliput, from whence it is parted only by a channel of 800 yards wide." Swift. The ambiguity may be removed thus:-" from whence it is parted by a channel of 800 yards

wide only." In the following examples the fense is left doubtful

by wrong arrangement of members.

"The minister who grows less by his elevation, like a little statue placed on a mighty pedestal, will always have his jealoufy flrong about him." Bolingh, Here, fo far as can be gathered from the arrangement, it is doubtful, whether the object introduced by way of fimile relates to what goes before or to what follows. The ambiguity is removed by the following arrangement: " The minister who, like a little statue placed on a mighty pedeftal, grows lefs by his elevation, will always," &c.

Speaking of the fuperstitious practice of locking up the room where a person of distinction dies: "The knight, feeing his habitation reduced to fo fmall a compals, and himself in a manner shut out of his own house, upon the death of his mother, ordered all the apartments to be flung open, and exorcifed by his chaplain." Sped. Better thus: "The knight, feeing his habitation reduced to fo fmall a compass, and himfelf in a manner thut out of his own house, ordered, upon the death of his mother, all the apartments to be flung open."

Speaking of some indecencies in conversation: " As it is impossible for fuch an irrational way of converfation to last long among a people that make any profession of religion, or show of modelty, if the country gentlemen get into it, they will certainly be left in the lurch." Ib. The ambiguity vanishes in the fol-- " the countrylowing arrangement: gentlemen, if they get into it, will certainly be left in

the lurch."

" And fince it is necessary that there should be a perpetual intercourse of buying and selling, and dealing upon credit, where fraud is permitted or connived at, or bath no law to punish it, the honest dealer is always undone, and the knave gets the advantage." Swift. Better thus: " And fince it is necessary that there should be a perpetual intercourse of buying and felling, and dealing upon credit, the honest dealer,

Language, where fraud is permitted or connived at, or hath no fuch a country, whatever it might be in the abbot of Language. law to punish it, is always undone, and the knave gets St Real's, which was Savoy, I think; or in Peru, under -

From these examples, the following observation will occur : That a circumstance ought never to be placed between two capital members of a period; for by fuch fituation it must always be doubtful, fo far as we gather from the arrangement, to which of the two members it belongs: where it is interjected, as it ought to be, between parts of the member to which it belongs, the ambiguity is removed, and the capital members are kept diffinct, which is a great beauty in composition. In general, to preserve members distinct that fignify things diftinguished in the thought, the best method is, to place first in the confequent mem-

ber, fome word that cannot connect with what pre-

If it shall be thought, that the objections here are too ferupulous, and that the defect of perspicuity is eafily fupplied by accurate punctuation; the answer is, That punctuation may remove an ambiguity, but will never produce that peculiar beauty which is perceived when the fenfe comes out clearly and diffinctly by means of a happy arrangement. Such influence has this beauty, that, by a natural transition of perception, it is communicated to the very found of the words, fo as in appearance to improve the music of the period. But as this curious fubject comes in more properly elsewhere, it is sufficient at present to appeal to experience, that a period, fo arranged as to bring out the fense clear, feems always more musical than where the fense is left in any degree doubtful.

The next rule is, That words expressing things connected in the thought, ought to be placed as near together as possible. This rule is derived immediately from human nature, prone in every instance to place together things in any manner connected: where things are arranged according to their connections, we have a fense of order; otherwise we have a fense of diforder, as of things placed by chance: and we naturally place words in the fame order in which we would place the things they fignify. The bad effect of a violent separation of words or members thus intimately connected, will appear from the following examples.

" For the English are naturally fanciful, and very often disposed, by that gloominess and melancholy of temper which is fo frequent in our nation, to many wild notions and visions, to which others are not fo liable." Sped. Here the verb or affertion is, by a pretty long circumftance, violently separated from the fabject to which it refers: this makes a harsh arrangement; the lefs excufable that the fault is easily prevented by placing the circumstance before the verb, after the following manner: " For the English are naturally fanciful, and by that gloominess and melancholy of temper which is so frequent in our nation, are often disposed to many wild notions, &c."

" From whence we may date likewife the rivalship of the house of France, for we may reckon that of Valois and that of Bourbon as one upon this occasion, and the house of Austria, that continues at this day, and has oft cost fo much blood and fo much treasure in

the course of it." Bolingbr.

"Li cannot be impertinent or ridiculous therefore in

the incas, where Garcilasso de la Vega says it was lawful for none but the nobility to fludy-for men of all

degrees to instruct themselves in those affairs wherein they may be actors, or judgers of those that act, or

controllers of those that judge." Ibid.

" If Scipio, who was naturally given to women, for which ancedote we have, if I mistake not, the authority of Polybius, as well as some verses of Nevius preferved by Aulus Gellius, had been educated by Olympias at the court of Philip, it is improbable that he would have restored the beautiful Spaniard." Ibid.

If any one have a curiofity for more specimens of this kind, they will be found without number in the

works of the fame author.

A pronoun, which faves the naming a person or thing a fecond time, ought to be placed as near as possible to the name of that person or thing. This is a branch of the foregoing rule; and with the reafon there given, another occurs, viz. That if other ideas intervene, it is difficult to recal the person or thing by

" If I had leave to print the Latin letters transmitted to me from foreign parts, they would fill a volume, and be a full defence against all that Mr Patridge, or his accomplices of the Portugal inquifition, will be ever able to object; who, by the way, are the only enemies my predictions have ever met with at home or abroad." Better thus: ---- " and be a full defence against all that can be objected by Mr Patridge, or his accomplices of the Portugal inquifition; who, by the way, are," &c.

" There being a round million of creatures in human figure, throughout this kingdom, whose whole subsistence," &c. Swift. Better: "There being, throughout this kingdom, a round million of creatures in human figure, whose whole subfiftence," &c.

The following rule depends on the communication of emotions to related objects; a principle in human nature that hath an extensive operation: and we find this operation, even where the objects are not otherwife related than by juxtapolition of the words that express them. Hence, to elevate or depress an object, one method is, to join it in the expression with another that is naturally high or low: witness the following fpeech of Eumenes to the Roman fenate.

" Caufam veniendi,fibi Romam fuiffe, præter cupiditatem visendi deos hominosque, quorum beneficio in ea fortuna esset, supra quam ne optare quidem auderet, etiam ut coram moneret senatum ut Persei conatus obviam iret." Livy. To join the Romans with the gods in the fame enunciation, is an artful stroke of flattery, because it tacitly puts them on a level-

On the other hand, the degrading or vilifying an object, is done fuccefsfully by ranking it with one that is really low : " I hope to have this entertainment in readiness for the next winter; and doubt not but it will please more than the opera or puppet-show." Spea.

" Manifold have been the judgments which Heaven from time to time, for the chastifement of a sinful people, has inflicted upon whole nations. For when the degeneracy becomes common, it is but just the punishment should be general. Of this kind, in our own unfortunate country, was that destructive pestilence, Language. whose mortality was so fatal as to sweep away, if Sir William Petty may believed, five millions of Christian fouls, befides women and Jews." Arbuthnot.

" Such also was that dreadful conflagration ensuing in this famous metropolis of London, which confumed, according to the computation of Sir Samuel Moreland, 100,000 houses, not to mention churches and ftables." Ibid

"But on condition it might pass into a law, I would gladly exempt both lawyers of all ages, fubaltern and field officers, young heirs, dancing-mafters, pick poc-

kets, and players." Swift.

Sooner let earth, air, fea, to chaos fall, Men, monkeys, lap-dogs, parrots, perifh all. Rape of the Lock.

Circumstances in a period resemble small stones in a building, employed to fill up vacuities among those of a larger fize. In the arrangement of a period. fuch under parts crowded together make a poor figure; and

never are graceful but when interspersed among the capital parts.

"It is likewife urged, that there are, by computation, in this kingdom, above 10,000 parfons, whose revenues, added to those of my lords the bishops, would suffice to maintain, &c. * Swijs. Here two circumstances, viz. by computation, and in this kingdom, are crowded together unnecessarily. They make a better appearance separated in the following manner: " It is likewife urged, that in this kingdom there are by computation, above 10,000 parfons," &c.

If there be room for a choice, the fooner a circumftance is introduced, the better; because circumftances are proper for that coolness of mind, with which we begin a period as well as a volume : in the progress, the mind warms, and has a greater relish for matters of importance. When a circumstance is placed at the beginning of the period, or near the beginning, the transition from it to the principal subject is agreeable : it is like afcending, or going upward. On the other hand, to place it late in the period has a bad effect; for after being engaged in the principal subject, one is with reluctance brought down to give attention to a circumstance. Hence evidently the preference of the following arrangement, "Whether in any country a choice altogether unexceptionable has been made, feems doubtful;" before this other, "Whether a choice altogether unexceptionable has in any country been made," &c.

For this reason the following period is exceptionable in point of arrangement. " I have confidered formerly, with a good deal of attention, the fubject upon which you command me to communicate my thoughts to you." Boling. Which, with a flight alteration, may be improved thus: " I have formerly, with a good deal of attention, confidered the fubject," &c.

Swift, speaking of a virtuous and learned education : " And although they may be, and too often are, drawn by the temptations of youth, and the opportunities of a large fortune, into fome irregularities, when they come forward into the great world; it is ever with reluctance and compunction of mind, because their bias to virtue still continues." Better; "And although, when they come forward into the great world. they may be, and too often," &c.

In arranging a period, it is of importance to deter. Language. mine in what part of it a word makes the greatest

figure, whether at the beginning, during the course, or at the close. The breaking filence rouses the attention, and prepares for a deep impression at the beginning: the beginning, however, must yield to the close; which being succeeded by a pause, affords time for a word to make its deepest impression. Hence the following rule, That to give the utmost force to a period, it ought, if possible, to be closed with that word which makes the greatest figure. The opportunity of a paufe should not be thrown away upon accessories, but referved for the principal object, in order that it may make a full impression: which is an additional reason against closing a period without a circumstance. There are, however, periods that admit not fuch a ftructure; and in that case the capital word ought, if possible, to be placed in the front, which next to the close is the most advantageous for making an impreffion. Hence, in directing our discourse to a man of figure, we ought to begin with his name; and one will be fensible of a degradation when this rule is neglected, as it frequently is for the fake of verfe. We give the following examples.

Integer vitæ, scelerisque purus, Non eget Mauri jaculis, neque arcu, Nec venenatis gravida fagittis,

Fusce, pharetra. Horat. Carm. 1. 1. ode 22.

Je crains Dieu, cher Abner, et n'ai point d'autre

In these examples, the name of the person addressed to, make a mean figure, being like a circumstance flipt into a corner. That this criticism is well founded, we need no other proof than Addison's translation of the last example :

O Abner! I fear my God, and I fear none but Guardian, nº 117.

O father, what intends thy hand, she cry'd, Against thy only fon? What fury, O fon, Poffesses thee to bend that mortal dart Against thy father's head?

Paradife loft, book ii. l. 727.

Every one must be fensible of a dignity in the invocation at the beginning, which is not attained by thatin the middle. It is not meant, however, to cenfurethis passage: on the contrary, it appears beautiful, by diftinguishing the respect that is due to a father from that which is due to a fon.

The fubstance of what is faid in this and the foregoing fection, upon the method of arranging words in a period, fo as to make the deepest impression with refpect to found as well as fignification, is comprehended in the following observation: That order of words in a period will always be the most agreeable, where, without obscuring the fense, the most important images, the most fonorous words, and the longest members, bring up the rear.

Hitherto of arranging fingle words, fingle members, and fingle circumstances. But the enumerationof many particulars in the fame period is often neceffary; and the question is, In what order they should be placed ? And, first, with respect to the enumeraLanguage, ting particulars of equal rank: As there is no cause for preferring any one before the reft, it is indifferent to the mind in what order they be viewed; therefore it is indifferent in what order they be named. 2dly, If a number of objects of the same kind, differing only in fize, are to be ranged along a straight line, the most agreeable order to the eve is that of an increasing feries: in forvevier a number of fuch objects, beginning at the leaft, and proceeding to greater and greater, the mind fwells gradually with the fuccessive objects, and in its progress has a very fensible pleasure. Precisely for the same reason, words expressive of such objects ought to be placed in the fame order. The beauty of this figure, which may be termed a climax in fenfe, has escaped Lord Bolingbroke in the first member of the following period: " Let but one, great, brave, difinterefted, active man arife, and he will be received, followed, and almost adored." The following arrangement has fenfibly a better effect : " Let but one brave, great, active, difinterested man arise," &c. Whether the fame rule ought to be followed in enumerating men of different ranks, feems doubtful; on the one hand, a number of persons presented to the eye in form of an increasing series, is undoubtedly the most agreeable order; on the other hand, in every lift of names, we fet the person of the greatest dignity at the top, and descend gradually through his inferiors. Where the purpose is to honour the persons named according to their rank, the latter ought to be followed; but every one who regards himself only, or his reader, will choose the former order. 3dly, As the sense of order directs the eye to descend from the principal to its greatest accessory, and from the whole to its greatest part, and in the fame order through all the parts and accessories, till we arrive at the minutest; the same order ought to be followed in the enumeration of fuch

> When force and liveliness of expression are demanded, the rule is, to fuspend the thought as long as posfible, and to bring it out full and entire at the close: which cannot be done but by inverting the natural arrangement. By introducing a word or member before its time, curiofity is raifed about what is to follow; and it is agreeable to have our curiofity gratified at the close of the period: the pleasure we feel resembles that of feeing a stroke exerted upon a body by the whole collected force of the agent. On the other hand, where a period is fo constructed as to admit more than one complete close in the fense, the curiofity of the reader is exhausted at the first close, and what follows appears languid or superfluous: his disappointment contributes also to that appearance, when he finds, contrary to jexpectation, that the period is not yet finished. Cicero, and after him Quintilian, recommend the verb to the laft place. This method e-vidently tends to suspend the sense till the close of the period; for without the verb the fense cannot be complete: and when the verb happens to be the capital word, which it frequently is, it ought at any rate to be the laft, according to another rule above laid down. The following period is placed in its natural order: " Were instruction an effential circumstance in epic poetry, I doubt whether a fingle instance could be given of this species of composition in any lan-guage." The period thus arranged admits a full close pon the word composition; after which it goes on lan

guidly, and clofes without force. This blemish will Language, be avoided by the following arrangement: "Wree instruction an effential circumflance in epic poetry, I doubt whether, in any language, a fingle instance could be given of this fpecies of composition."

"Some of our most eminent divines have made use of this Platonic notion, as far as it regards the sub-fiftence of our passions after death, with great beauty and strength of reason." Speat. Better thus: "Some of our most eminent divines have, with great beauty and strength of reason, made use of this Platonic no-dard strength of reason, made use of this Platonic no-

tion," &c

"Men of the beft fense have been touched, more or lefs, with these groundless horrors and prelages of finturity, upon surveying the most different works of nature." Ib. Better, "Upon surveying the most indifferent works of nature, men of the best sense." &c.

"She foon informed him of the place he was in; which, notwithstanding all its lorrors, appeared to him more sweet than the bower of Mahomet, in the company of his Balfora." Guardian. Better, "She foon, &c. which appeared to him, in the company of his Balfora, more sweet than the bower of Mallomet."

None of the rules for the composition of periods are more liable to be abused than those last mentioned; witness many Latin writers, among the moderns especially, whole style, by inversions too violent, is readered harsh and obscure. Suspension of the thought till the close of the period, ought never to be preferred hefore perspicuity. Neither ought such single single till the the single she will be she wildered amidit a prostion of words: a traveller, while he is puzzled about the road, relistes not the finest prospect: "All the rich presents which Adlyages had given him at parting, keeping only some Median horses, in order to propagate the breed of them in Persia, he distributed among his friends whom he left at the court of Ecbatana." Trav. of

III. Beauties from a refemblance between Sound and Signification. There being frequently a throng refemblance of one found to another, it will not be furpifing to find an articulate found refembling one that is not articulate: thus the found of a bow-firing is imitated by the words that express it.

Twang'd foot and sharp, like the shrill swallow's cry.

Odysey, xxi. 449.

The found of felling trees in a wood:

Loud founds the ax, redoubling ftrokes on ftrokes, On all fides round the forest hurls her oaks Headlong. Deep echoing groan the thickets brown, Then russing, cracking, crassing, thunder down. † Islad. xxiii. 144.

But when loud furges lash the founding shore,
The lioarse rough verse should like the torrent roar.

Pope's Esfay on Criticism, 369.

Dire Scylla there a fcene of horror forms, And here Charybdis fills the deep with ftorms: When the tide ruftes from her rumbling caves, The rough rock roars; tumultuous boil the waves.

No person can be at a loss about the cause of this beauty; it is obviously that of imitation.

That there is any other natural refemblance of found to fignification, mult not be taken for granted. There is no refemblance of found to motion, nor of found to sentiment. We are, however, apt to be deceived by artful pronunciation: the fame passage may be pronounced in many different tones, elevated or humble, fweet or harsh, brisk or melancholy, so as to accord with the thought or fentiment: fuch concord must be distinguished from that concord between found and fense which is perceived in fome expressions independent of artful pronunciation; the latter is the poet's work, the former must be attributed to the reader. Another thing contributes ftill more to the deceit : in language, found and fenfe being intimately connected, the properties of the one are readily communicated to the other; for example, the quality of grandeur, of fweetness, or of melancholy, though belonging to the thought foley, is transferred to the words, which by that means refemble in appearance the thought that is expressed by them. That there may be a refemblance of articulate founds to fome that are not articulate, is felf-evident; and that in fact there exift fuch refemblances fuccefsfully employed by writers of genius, is clear from the foregoing examples, and from many others that might be given. But we may fafely pronounce, that this natural resemblance can be carried no farther; the objects of the different fenses differ so widely from each other, as to exclude any refemblance; found in particular, whether articulate or inarticulate, refembles not in any degree tafte, fmell, nor motion; and as little can it refemble any internal fentiment, feeling, or emotion. But must we then admit, that nothing but found can be imitated by found? Taking imitation in its proper fense, as importing a refemblance between two objects, the proposition must be admitted : and yet in many pasfages that are not descriptive of found, every one must be fenfible of a peculiar concord between the found of the words and their meaning. As there can be no doubt of the fact, what remains is to enquire into its caufe.

Refembling causes may produce effects that have no refemblance; and causes that have no resemblance may produce refembling effects. A magnificent building, for example, refembles not in any degree an heroic action; and yet the emotions they produce are concordant, and bear a resemblance to each other. We are still more fensible of this resemblance in a fong, when the mufic is properly adapted to the fentiment: there is no refemblance between the thought and found: but there is the strongest resemblance between the emotion raifed by mufic tender and pathetic, and that raifed by the complaint of an unfuccessful lover. Applying this observation to the present subject, it appears, that, in fome instances, the found even of a fingle word makes an impression resembling that which is made by the thing it fignifies: witness the word running, composed of two short syllables; and more remarkably the words rapidity, impetuofity, precipitation. Brutal manners produce in the fpectator an emotion not unlike what is produced by a harsh and rough found; and hence the beauty of the figurative expression, rugged manners. Again, the word little, being pronounced with a very small aperture of the

mouth, has a weak and faint found, which makes an Language. impression resembling that made by a diminutive obiect. This refemblance of effects is still more remarkable where a number of words are connected in a period: words pronounced in succession make often a ftrong impression; and when this impression happens to accord with that made by the fense, we are fensible of a complex emotion, peculiarly pleafant; one proceeding from the fentiment, and one from the melody or found of the words. But the chief pleafure proceeds from having these two concordant emotions combined in perfect harmony, and carried on in the mind to a full close. Except in the fingle case where found is described, all the examples given by critics of sense being imitated in found, refolve into a refemblance of effects: emotions raifed by found and fignification may have a refemblance; but found itself cannot have a refemblance to any thing but found.

Proceeding now to particulars, and beginning with those cases where the emotions have the strongest refemblance, we observe, first, That by a number of fyllables in fuccession, an emotion is sometimes raised. extremely fimilar to that raifed by fuccessive motion ; which may be evident even to those who are defective in talle, from the following fact, that the term movement in all languages is equally applied to both. In this manner, fuccessive motion, such as walking, running, galloping, can be imitated by a fuccession of long or fhort fyllables, or by a due mixture of both : for example, flow motion may be justly imitated in a verse where long fyllables prevail; especially when aided by

a flow pronunciation :

Illi inter sese magna vi brachia tollunt.

Georg. iv. 174. On the other hand, fwift motion is imitated by a fuccession of short fyllables;

Quadrupedante putrem sonitu quatit ungula campum. Again :

Radit iter liquidum, celeres neque commovet alas.

Thirdly, A line composed of monosyllables makes an impression by the frequency of its paules, similar to what is made by laborious interrupted motion :

With many a weary step, and many a groan, Up the high hill he heaves a huge round stone. Ody Jey, xi. 736

First march the heavy mules securely slow : O'er hills, o'er dales, o'er eraggs, o'er rocks they go. Iliad, xxiii. 138.

Fourthly, The impression made by rough founds in fuccession, resembles that made by rough or tumultuous motion : on the other hand, the impression of fmooth founds refembles that of gentle motion. The following is an example of both.

Two craggy rocks projecting to the main, The roaring winds tempestuous rage restrain; Within, the waves in fofter murmurs glide, And thips fecure without their haulfers ride.

Odyffey, iii. 118.

Another example of the latter:

Language. Soft is the strain when Zephyr gently blows, And the fmooth stream in smoother numbers flows. Esfay on Criticism, 366.

> Fifthly, Prolonged motion is expressed in an iniexandrine line. The first example shall be of a slow motion prolonged:

> A needless Alexandrine ends the fong; That, like a wounded fnake, drags its flow length along.

Tb. 256.

The next example is of forcible motion prolonged: The waves behind impel the waves before; Wide-rolling, foaming high, and tumbling to the shore.

Iliad, xiii. 1004. The last shall be of rapid motion prolonged:

Not so when swift Camilla fcours the plain, Flies o'er the unbending corn, and skims along the

Effay on Criticism, 373.

Again, speaking of a rock torn from the brow of a mountain:

Still gathering force, it fmokes, and, urg'd amain, Whirls, leaps, and thunders down impetuous to the

Iliad, xiii. 197.

Sixthly, A period confifting mostly of long fyllables, that is, of fyllables pronounced flow, produceth an emotion refembling faintly that which is produced by gravity and folemnity. Hence the beauty of the following verse:

Olli fedato respondet corde Latinus.

It refembles equally an object that is infipid and uninserefting.

Tædet quotidianarum harum formarum.

Terence.

Seventhly, A flow fuccession of ideas is a circumstance that belongs equally to fettled melancholy, and to a period composed of polysyllables pronounced flow; and hence, by fimilarity of emotions, the latter is imitative of the former:

In those deep folitudes, and awful cells, Where heav'nly-penfive Contemplation dwells, And ever-mufing Melancholy reigns.

Pope, Eloifa to Abelard.

Eighthly, A long fyllable made fhort, or a fhort fyllable made long, raifes, by the difficulty of pronouncing contrary to custom, a feeling fimilar to that of hard labour :

When Ajax strives some rock's vast weight to throw, The line too labours, and the words move flow.

Effay on Criticism, 370.

Ninthly, Harsh or rough words pronounced with difficulty, excite a feeling fimilar to that which proceeds from the labour of thought to a dull writer : Nº 174.

Just writes to make his barrenness appear, And strains from hard-bound brains eight lines a-year. Pope's Epistle to Dr Arbuthnot, 1. 181.

We shall close with one example more, which of all makes the finest figure. In the first fection mention is made of a climax in found; and in the fecond of a climax in fenfe. It belongs to the prefent fubiect to observe, that when these coincide in the same passage, the concordance of found and fense is delightful: the reader is confcious of pleafure not only from the two climaxes feparately, but of an additional pleafure from their concordance, and from finding the fenfe fo justly imitated by the found. In this respect, no periods are more perfect than those borrowed from Cicero in the first fection.

The concord between fense and found is not less agreeable in what may be termed an anticliman, where the progress is from great to little; for this has the effect to make diminutive objects appear still more diminutive. Horace affords a striking example :

Parturiunt montes, nascetur sidiculus mus.

The arrangement here is fingularly artful: the first place is occupied by the verb, which is the capital word by its fenfe as well as found: the close is referved for the word that is the meanest in sense as well as in found: and it must not be overlooked, that the refembling founds of the two last fyllables give a ludicrous air to the whole.

In this article we have mentioned none of the beauties of language but what arise from words taken in their proper fense. Beauties that depend on the metaphorical and figurative power of words, are treated under the separate articles of Figures, Personifica-TION, APOSTROPHE, HYPERBOLE, METAPHOR, &C.

See also ORATORY.

Purity of LANGUAGE. Both the Greeks and Romans were particularly careful of preferving the purity of their language. It feems amongst the Romans to have been a point which they thought worthy the attention of the state itself; for we find the Cumeans not daring to make use of the Latin language in their public acts without having first obtained leave in form. Tiberius himself would not hazard the word monopolium in the fenate without making an excuse for employing a foreign term. Seneca gives it as a certain maxim, that wherever a general false taste in style and expression prevails, it is an infallible sign of a corruption of manners in that people: A liberty of introducing obsolete words, or forming new ones, is a mark, he thinks, of an equal licentiousness of the moral kind. Accordingly it is observed, there are scarce more than eight or ten inflances of new words to be produced from the most approved Roman writers, in the course of two or three centuries If this mode of reasoning concerning the morals of the state was introduced and applied in our own country, no nation on the face of the earth could appear more abandoned; for no nation is more fond of adopting new words, though our language is fufficiently copious. This delicacy of Seneca appears to be carried a little too far, and his manner of estimating the morals of the people must be a little fallacious. The Greeks were very remarkable for Langued for their difcernment of provincialisms, especially the Athenians, whose dialect was inconceivably sweet and Languer.

LANGUED, in heraldry, expresses such animals whose tongue, appearing out of the mouth, is borne of a different colour from the rest of the body.

LANGUEDOC, a large and maritime province of France; bounded on the north by Quercy, Rouerque, Auvergne, and Lionnois; on the east by Dauphiny and Provence; on the west by Gascony; and on the fouth by the Mediterranean Sea and Roufillon. It is 225 miles in length, and 100 in breadth where broadeft. The clergy are more rich and numerous here than in the rest of France, there being three archbishops and 20 bishops. Languedoc is divided into the Upper and Lower; and in general it is a very pleafant country, fertile in corn, fruits, and excellent wines; and the inhabitants carry on a confiderable trade. There are many curious medicinal plants, with iron mines, quarries of marble, and turquoise stones. There is also a great deal of kelp, and on the heaths are confiderable numbers of the kermes oak. The principal rivers are the Rhone, the Garonne, the Aude, the Tarne, the Allier, and the Loire. There are also a great number of mineral springs. Thoulouse is the capital town. This province is famous for the royal canal, which divides it in two, joining the Mediterranean with the Atlantic Ocean. This canal was undertaken in 1666, and finished in 1680; the mathematician who undertook it made a bason 400 yards long, 300 broad, and 7 feet deep, which is always kept full of water, and may be let out by means of a fluice on the fide of the Mediterranean, as well as by another on the fide of the Atlantic,

LANGUET (Hubert), born at Viteaux in Burgundy in 1518, gained great reputation by his learning and virtue in the 16th century. Having read one of Melancthon's books at Bologna, he conceived fo high an esteem for the author, that he went to Wirtemberg purposely to visit him; he arrived there in 1549, when he contracted a ftrict friendship with Melancthon, and embraced the Protestant religion. In 1565, he was one of the first counsellors of Augustus elector of Saxony, who employed him in feveral important affairs and negociations. He was afterwards admitted to the confidence of William prince of Orange; and died at Antwerp, on the 30th of September 1581. We have many of his letters written in Latin to Sir Philip Sydney, to Camerarius the father and fon, and to Augustus elector of Saxony, which have been several times reprinted, in three volumes; and there is also attributed to him a famous treatife, intitled, Vindicia contra Tyrannos, and other works. His life is written by Philibert de la Mare.

LANGURY (John Baptill Joseph), the celebrated vieur of St Sulpice at Paris, and a doctor of the Sorbonne, was born at Dijon in 1675. He was received into the Sorbonne in 1698; and attached himself to the community of St Sulpice, to which parish he was of great fervice. M. de la Chetardie the vieur, confectous of his talents, choic him for his curate, in which capacity he officiated near 10 years; and in 1714, fucceeded to the vicarage. His parish-church being small and out of repair, he conceived the design of building a church fuitable to the fixe of his parish, which he

Vol. IX. Part II.

began with the fum of 100 crowns, but foon obtained Languet confiderable donations; and the duke of Orleans, regent of the kingdom, granted him a lottery, and laid, the first stone of the porch in 1718. It was confecrated in 1745, after M. Languet had spared neither labour nor expence to render it one of the finest churches in the world both for architecture and ornament. Another work which did him no less honour was the Maifon de l'enfant Jesus. This establishment consists of two parts; the first composed of about 35 poor ladies of good families, and the fecond of more than 400 poor women and children of town and country. The order and economy in this house, for the education and employment of fo many perfons, gave cardinal Fleury so high an idea of the vicar of St Sulpice. that he proposed to make him superintendant-general of all the hospitals in the kingdom; which, however, was declined. Never man took more pains than lie did to procure charitable donations and legacies, which he diffributed with admirable difcretion : he is faid from good authority to have deburfed near a million of livres to the poor annually. When there was a general dearth in 1725, he fold, in order to relieve the poor, his household goods, pictures, and some curious pieces of furniture that he had procured with difficulty; and when the plague raged at Marfeilles, he fent large fums into Provence for the relicf of the distressed. M. Languet was not only fingular in this warm, difinterested, benevolent conduct, but also in another circumftance equally rare; and this was in the refusal of feveral bishoprics that were offered him: he refigned even his vicarage in 1748; but continued to preach every Sunday at his own parish-church, and to support the Maison de l'enfant Jesus, to his death, which happened in 1750. It is observed, that his piety and charity did not proceed from poverty of talents; for he was fensible and lively in conversation, and his genius often discovered itself in his agreeable repartees.

LANGUOR, among physicians, fignifies great weakness and loss of thrength, attended with a dejection of mind; fo that the patients can fearce walk or even stand upright, but are apt to faint away.

LANHAM. See LAVENHAM.

LANIARD (from Lanier, Fr.), a fhort piece of cord or line fastened to several machines in a ship, and ferving to fecure them in a particular place, or to manage them more conveniently. Such are the laniards of the gun-ports, the laniard of the buoy, the laniard of the cat hook, &c .- The principal laniards used in a ship, however, are those employed to extend the shrouds and stays of the masts by their communication with the dead-eyes, fo as to form a fort of mechanical power refembling that of a tackle.- These laniards are fixed in the dead-eyes as follows: one end of the laniard is thrust through one of the holes of the upper dead-eye, and then knotted, to prevent it from drawing out; the other is then paffed through one of the holes in the lower dead-eye, whence, returning upward, it is inferted through the fecond hole in the upper dead-eve, and next through the fecond in the lower dead eye, and finally through the third holes in both dead eyes. The end of the laniard being then directed upwards from the lowest dead-eye, is stretched as stiff as possible by the application of tackles; and that the feveral parts of it may flide with more

Lanigerous facility through the holes in the dead eyes, it is

well smeared with hog's-lard or tallow, so that the strain is immediately communicated to all the turns at once.

LANIGEROUS, an appellation given to whatever

bears wool.

LANISTA, in antiquity, is fometimes used to fignify an executioner; but more frequently for a maftergladiator, who taught the use of arms, and had always people under them ready to exhibit shows of that kind. For this purpofe, they either purchased gladiators, or educated children, that had been expofen, in that art.

LANIUS, the SHRIKE, or Butcher-bird, in ornithology; a genus belonging to the order of accipitres, CCLXII, and the characters of which are thefe: The beak is fomewhat strait, with a tooth on each fide towards the apex, and naked at the base; and the tongue is lacerated.

> 1. The excubitor, great einereous shrike, or greater butcher-bird, is in length 10 inches. The plumage on the upper parts is of a pale ash-colour; the under, white: through the eyes there is a black stripe: the fcapulars are white: the base of the greater quills is white, the reft black: the tail is fomewhat cuneiform; the two middle feathers are black; the outmost on each fide, white; those between are black, with the ends more or less white: the legs are black. Its bill is black, one inch long, and hooked at the end; the upper mandible furnished with a sharp process: the nostrils are oval, covered with black briftles pointing downwards: the muscles that move the bill are very thick and ftrong; which makes the head very large. This apparatus is quite requifite in a species whose method of killing its prey is fo fingular, and whose manner of devouring it is not less extraordinary: small birds it will feize by the throat, and strangle; which probably is the reason the Germans also call this bird wurchangl, or "the fuffocating angel." It feeds on fmall birds, young neftlings, beetles, and caterpillars. When it has killed the prey, it fixes them on some thorn, and when thus spitted pulls them to pieces with its bill : on this account the Germans call it thorntraer and thornfreker. When confined in a cage, they will often treat their food in much the fame manner, sticking it against the wires before they devour it.-This bird inhabits many parts of Europe and North America. The female makes its neft with heath and mofs, lining it with wool and gossamer; and lays fix eggs, about as big as those of a thrush, of a dull olive-green, sported at the thickest end with black. In spring and fummer it imitates the voices of other birds, by way of decoving them within reach, that it may deftroy them; but beyond this, the natural note is the fame throughout all feafons. If a trap-fall be baited with a living small bird, it proves a decoy, by which it may be taken in winter. It is observed to be mute when kept in a cage, though feemingly content .- In countries where they are plenty, the husbandmen value them, on supposition of their destroying rats, mice, and other vermin. They are supposed to live five or fix years; and are often trained up for catching small birds in Ruffia. In Carniola they are migratory, coming in May and departing in September; which is the case also in respect to the few which are met with in England.

2. The collario, or leffer butcher-bird, is feven

inches and a half in length. The irides are hazel; the Lanius, bill refembles that of the preceding species: the head and lower part of the back are of a fine light grey ; across the eyes from the bill runs a broad black ftroke: the upper part of the back, and coverts of the wings, are of a bright ferruginous colour; the breaft, belly, and fides, are of an elegant bloffom colour; the two middle feathers of the tail are longest, and entirely black; the lower part of the others white, and the exterior webs of the outmost feather on each fide wholly fo. In the female, the stroke across the eyes is of a reddish brown; the head of a dull rust colour mixed with grey; the breaft, belly, and fides, are of a dirry white, marked with femicircular dufky lines : the tail is of a deep brown; the outward feather on each fide excepted, whose exterior webs are white. It is rather larger than the male. This bird is much more common than the former species. Mr Latham suspects its being a bird of passage, never having seen it in winter. It lave. fix white eggs marked with a rufous brown circle towards the large end. The neft is generally in a hedge or low bush ; near which, it is faid, no small bird chooses. to build; for it not only feeds on infects, but also on the young of other birds in the neft, taking hold of them by the neck, and ftrangling them, beginning to eat them first at the brain and eyes. It is fonder of grashoppers and beetles than of other infects, which it eats by morfels, and, when fatisfied, flicks the remainder on a thorn; when kept in a cage, it does the fame against the wires of it, like the former species. It is called in the German language by a name fignifying "great head," or "bull head," from the fize of that part. It will also feed on sheep's kidneys, if in a cage, eating a whole one every day. Like the cinereous shrike, it only mocks the notes of other birds. having none of its own; and this merely, like that, to decoy. It is faid to be in this imitative art an adept; if money is counted over at midnight in the place where one of these is kept, so as to make a jingling noise, it begins to imitate the same found. When fitting on the neft, the female is foon discovered; for

3. The conilescens, or fork-tailed Indian butcherbird of Edwards, is in length about feven inches and a half: the bill is blackish brown, and bent; the upper mandible befet with black hairs turning forwards : the plumage on the upper parts of the body is a fine black. with a gloss of blue and in some lights green; the under parts are white : the greater quills and tail are of a ferruginous black; the tail is pretty much forked, and the outer feather spotted with dirty white. It inhabits Bengal, where it is called fingab. It is called also by the Indians the king of the crows, from its putfuing these birds from place to place with a great noise, and pecking them on the back till they escape

on the approach of any one, she sets up an horrible

4. The Antiguan shrike (or Pie-griesche d' Antigue of Sonnerat) is about the fixe of a lark. Its bill is large and black; the upper mandible very long, and the curvature fo excessive that one would rather take it for a monfrosity than common to any one species: the irides are dusky : the head is black; the back, of a yellowish rufous colour: the throat and breast are white; the quills, and baftard wing-coverts, black; and the wings reach only to the beginning of the tail,

Lanius, which is very long and wedge-shaped; the two middle

feathers are wholly black; the legs are dufky black. It inhabits Panay, one of the Philippine islands, but principally about Antigue, one of the provinces thereof. g. The jocofus, or jocofe shrike, is in length seven

inches and a half. The bill is blackifh, rather thraighter than in most of the genus, and furnished only with a very fine notch near the tip: the crown of the head is black, except fome long brown feathers, which form a kind of creft: the fides of the head, throat, and fore part of the neck, are white; from each corner of the mouth there is a black line, continued backwards; and under each eye is a fmall foot of lively red; the upper parts of the body are brown; the under parts, dirty white : the vent, rofe-colour : on the lower part of the neck and breaft there is a kind of a brown bandt the quills are brown: the tail is greatly wedge shaped, and in colour brown, except the four outer feathers on each fide, which have white tips; the legs and claws are black. This is a Chinese bird, and called in those parts by the name of kowkai-kon. It feeds upon rice

and infects, particularly cockroaches.

6. The infaultus, or rock-shrike, is in length seven inches and three quarters. The bill is about an inch long, and blackish: the head and neck are of a dark ash-colour, marked with small rufous spots: the upper part of the back is a dark brown; the lower much paler, inclining to ash, especially towards the tail: the quills and wing-coverts are dusky, with pale margins: the breat, and under parts of the body, are orange, marked with fmall fpots, fome white and others brown: the tail is three inches in length; the two middle feathers are brown, the others rufous; the legs are blackish; the wings and tail are even. This is the description of the female. The male is faid to differ very little, except in being of a brighter colour. -This species is met with in many parts of Europe, from Italy on the one hand, to Ruffia on the other; and is found in some parts of Germany, the Alpine mountains, those of Tyrol, and fuch-like places. The manners of this bird feem disputed. Buffon fays that it perches on a high stone, and as soon as a marksman appears with his gun, removes to a greater distance, and fo on as often as he approaches; which renders this species difficult to come at. Brunnich and Linnæus, on the contrary, fay that it is a bold bird, attending the traveller while at his meal, on purpose to feed on his scraps. It has an agreeable note of its own, approaching to that of the hedge sparrow, and will also learn to imitate that of others. It makes the nest among the holes of the rocks, &cs hiding it with great art; and lays three or four eggs, feeding the young with worms and infects, on which it also feeds itself. It may be taken young from the nest, and brought up as the nightingale.

7. The faustus, or white-wreathed shrike, is about the fize of a common thrush. Its bill is pale : the upper parts of the body are grey; the under ferruginous: from the eyes to the hind head there passes a whitish line, composed of numerous white feathers, rendering it truly characteristic; the wings are rounded; the quills brownish, with grey edges, which are croffed with numerous slender brown lines: the tail is rounded, brown, and croffed with numerous bars of darker brown: the legs are pale. This elegant species inhabits China, where it is known by the name of whom- they are called king-birds.

maj. It may be observed, among others, in Chinese Lanius, paper-hangings, where the white line feems to encompass the back part of the head like a wreath.

8. The Dominican shrike (or Pie-griesche Dominiquaine of Sonnerat), is bigger than a sparrow, and rather longer. The bill is greyish, conical, and strong : the base beset with britles, pointing forwards: the head, neck, breaft, back, wings, and tail, are black; the belly and rump white: the wings reach near an inch beyond the middle of the tail: the thighs are black. It inhabits the Philippine islands, and is a bold courageous bird: it flies very quick, and with great rapidity; frequently hovering in the air like a fwallow. It is a great enemy to the raven; to whom, though much bigger, he bids defiance, and even provokes him to combat : the battle often lafts half an hour, and ends with the retreat of the raven; rather. perhaps, from being teafed out than much injured

by the little enemy.

9. The nengeta (Guirarou, Buff.) is in length nine or ten inches. Its bill is dufky, and befet with briftles at the base: the irides are sapphire-coloured ; and from the angles of the mouth, through the eyes, there runs a black streak : the upper parts of the body are of a dark brownish ash-colour; the under parts cinereous white: in the middle of the wing are a few white feathers; the quills and tail are nearly black; and all the feathers of the laft, except the two middle ones, are obliquely tipped with white: the legs are of a dark ash-colour; the claws black .- These birds are found at Surinam and Brafil. They are common likewife at Guiana, where they frequent watery places, and are found in great numbers together. They are observed, at frequent intervals, to set up a great cry all together; which affords a happy and certain prefage to the thirsty traveller, in the immense forests of Guiana, of water being at hand.

10. The tyrannus, or tyrant shrike, is about the fize

of a thrush. Its bill is a blackish brown, beset with briftles at the base: the irides are brown: the upper parts of the plumage grey brown; the under, white ! the breast inclines to ash colour; the head is blackish on the upper part; the base of the feathers on that part in the male is orange, but feldom visible except it erects the feathers, when there appears a ftreak of orange down the middle of the crown: the tail is brown, marginated with rufous: the legs and claws are black brown. The female fearcely differs, except in the head; the base of the crown feathers being yellow inftead of orange; the colours are not quite fo deep, and it is a trifle less in fize. It inhabits Virginia .- There is a variety which inhabits St Domingo and Jamaica. These birds are called titiri. pipiri, or quiquiri, from their cry, which refembles those words. The first is called the black-headed or great-billed pipiri; the fecond, the yellow-headed pipiri or pipiri of paffage. The first though in plenty are seldom seen but in pairs; the fecond in great troops, about the month of August. when they are very fat, and killed in great numbers for the table, as their flesh is accounted good eating .- All authors agree in the manners of these birds, which are ferocious to a great degree while the hen is fitting: no bird whatever dare approach their nest : they will attack the first which comes near, without referve, and usually come off conquerors. From hence by fome Lanius

ferent from the preceding, in regard to specific cha- or number of cards, either in gold or filver, beyond Lantenna Lanfquinet racter. But he fays that it makes its nest rather exposed, on trees and bushes, frequently on the fasfafras ; whereas the pipiris make use of the hole of a tree, for the fake of concealing it. In Carolina it is a bird of passage, coming in spring, and making one nest in a year, which is commonly in June, and after bringing up its young, retires in autumn. These birds frequent also the red cedars : are seldom found in woods, but often in hedge rows and fences of fields, and for the most part within 200 yards of each other. They do not molest their own species; but the moment either crow, or even eagle, appears, all within reach join forces, and begin the attack in all parts of his body at once, never defifting till they have driven him to a great distance.

at. The albus, or white Panayan shrike, is about double the fize of a lark. Its bill is black: the head, neck, back, belly, and shoulders, are white: the rest of the wings and tail black; and across the greater quills there is a white band : the legs are black. It inhabits the ifle of Panay.

There are above 40 other species of this genus, befides many varieties.

LANNER, OF LANNAR. See FALCO.

LANSDOWNE (Lord). See GRANVILLE.

LANSQUINET, the name of a game at cards, of

It may be played at by any indifcriminate number of people, though a fingle pack of cards is used during the deal. The dealer, who possesses an advantage, shuffles the cards, and after they have been cut by another of the party, deals out two cards on his left hand, turning them up, then one for himfelf, and a fourth that he places on the table for the company, who is called the rejouissance. On this card any, or all the company, the dealer excepted, may put their money, which the dealer is compelled to answer. The dealer continues turning the cards upwards, one by one, till two of a fort come up, that is to fay, two aces, two deuces, &c. which, to prevent mistakes, or their being confidered as fingle cards, he places on each fide of his own card; and as often as two, three, or the fourth fort of a card come up, he invariably places, as before mentioned, on each fide of his own card. The company has a right to take and put money upon any fingle card, unless the dealer's card fhould happen to be double, which is often the rafe, by his card being the same as one of the two hand-cards, which he first dealt out on his left hand : thus he continues dealing till he brings either their cards or his own. Whilft the dealer's own card remains undrawn, he wins; and which ever card is turned up first, loses. If he deals out the two cards on his left hand, which are ftyled the hand cards, before his own, he is intitled to deal again. This advantage amounts to no more than his being exempted from lofing, when he turns up a fimilar card to his own, immediately after he has turned up one for himfelf.

Lanfquinet is often played without the rejouissance, the dealer giving every one of the party a card to put their money upon. It is also often played by dealing only two cards, one for the company and the other for the dealer.

It should likewise be observed, that a limitation is

The Carolina tyrant of Catefby is little, if at all, dif- generally fixed for the fum to be placed upon any card Lantane,

which the dealer is not obliged to answer.

LANTANA, or Indian sage, in botany: A genus of the angiospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 40th order, Personata. The calyx is indistinctly quadridentated; the stigma as it were broken and turned back like a hoof; the fruit is a plum with a bilocular kernel. There are feveral species, confifting of shrubby exotics from Africa and America for the green-house or stove; growing to the height of a yard or two, and adorned with oblong, oval, and roundish simple leaves, with monopetalous, tubular, four-parted flowers of different colours. They may be propagated either by feeds or cuttings - The camara, or wild fage, is remarkable for the beauty of its flowers; which are yellow, tinged with red. The involucrata, or fea-fide fage, has fmall ash-coloured leaves and a most agreeable smell. They are both natives of the West Indies, the former growing wild among the bushes, and the latter found near the sea. Their leaves. particularly those of the fea-fide fage, are used by the black people in teas for colds, rheums, and weakness of the stomach .- There are seven other species.

LANTERN, or LANTHORN, a device to carry a candle in; being a kind of cover usually made of white iron, with fashes of some transparent matter, as glass,

horn, &c. to transmit the light.

Dark LANGERN, one with only one opening, which may also be closed up when the light is to be entirely hid, or opened when there is occasion for the affiftance of the light to discover some object.

Magic LANTERN, an optic machine, whereby little painted images are represented so much magnified, as to be accounted the effect of magic by the ignorant.

See DIOPTICS, Art. x. p. 37.

LANTERN, in architecture, a little dome raised over the roof of a building to give light, and ferve as a crowning to the fabric.

The term lantern is also used for a square cage of carpentry, placed over the ridge of a corridor or gallery, between two rows of shops, to illumine them, like that of the royal exchange London.

LANTERN, on ship-board, a well known machine, of: which there are many in a ship, particularly for the purpose of directing the course of other ships in a fleet or convoy; fuch are the poop and top lanterns, &c.

Feast of LANGERNS, in China, is a celebrated feast held on the 15th day of the first month; so called from the infinite number of lanterns hung out of the houses and fireets; which, it is faid, is no less than two hundred millions. On this day are exposed lanterns of all prices, whereof some are faid to cost 2000 crowns. Some of their grandees retrench somewhat. every day out of their table, out of their dress, equipage, &c. to appear the more magnificent in lanterns. They are adorned with gilding, fculpture, painting, japanning, &c. And as to their fize, it is extravagant; fome being from 25 to 30 feet diameter: they represent halls and chambers, and two or three such machines together would make handsome houses; for that in China they are able to eat, lodge, receive vifits, have balls, and act plays in a lantern. To illumine them, they fhould have bonfires; but as that would be inconvenient, they content themselves with

lighting

Lantern lighting up in them an infinite number of torches images and ideas borrowed from all the fenfes, and has Laodicza, or lamps, which at a distance have a beautiful effect. Laocoon. In these they exhibit various kinds of shows, to divert the people. Besides these enormous lanterns, there is a multitude of others smaller, which usually confilt of fix faces or lights, each about four feet high, and one and a half broad, framed in wood finely gilt and adorned; over these they stretch a fine transparent filk, curiously painted with flowers, trees, and fometimes human figures: the painting is very extraordinary, and the colours extremely bright; and when the torches are lighted, they appear highly beautiful and furprifing.

LANTERN- Fly, in natural history. See FULGORA. LANUGO, the foft down of plants, like that growing on the fruit of the peach tree. See HAIR.

LAOCOON (fab. hift.), a fon of Priam and Hecuba, or according to others of Antenor or of Capys. As being prieft of Apollo, he was commissioned by the Trojans to offer a bullock to Neptune to render him propitious. During the facrifice two enormous ferpents issued from the sea, and attacked Laocoon's two fons who flood next to the altar. The father immediately attempted to defend his fons; but the ferpents falling upon him fqueezed him in their complicated wreathes, and he died in the greatest agonies. This punishment was faid to have been inflicted upon him for diffuading the Trojans to bring into the city the fatal wooden horse which the Greeks had consecrated to Minerva, as also for his impiety in hurling a javelin against the fides of the horse as it entered within the walls. According to Hyginus, he suffered the above punishment for his marriage against the confent of Apollo, or, according to others, for his polluting the temple, by his commerce with his wife Antione, before the statue of the god.

LACCOON, in the history of the arts, is a celebrated monument of Greek fculpture executed in marble by Polydorus, Athenodorus, and Agefander, the three famous artifle of Rhodes. This remain of antiquity was found at Rome in the ruins of the palace of Titus. in the beginning of the fixteenth century, under the pontificate of Julius II. and fince deposited in the Farnese palace. Laocoon, the prieft of Apollo and Neptune, is here represented with his two sons, with two hideous ferpents clinging round his body, gnawing it, and injecting their poison : Virgil has given us the follow-

ing description of the fact :

9 T.Sh.

+ Hift. of Greece, II.

377.

Serpens amplexus uterque Implicat, & miseros morsu depascitur artus. Corripiunt, Spirifque ligant ingentibus, & jam Bis medium amplexi, bis collo squamea circum Terga dati, Superant capite & cervicibus altis.

This statue exhibits the most astonishing dignity and tranquillity of mind in the midft of the most excrucixxxvi.c. 5. ating torments: Pliny * fays of it, that is, opus omnibus,

picturea & Statuaria artis, praferendum.

The Laocoon, Dr Gillies + observes, may be regarded as the triumph of Grecian sculpture; since bodily pain, the groffest and most ungovernable of all our passions, and that pain united with anguish and torture of mind, are yet expressed with such propriety and dignity, as afford lessons of fortitude superior to any taught in the schools of philosophy. The horrible shrick which Virgil's Lancoon emits is a proper circumftance for poetry, which speaks to the fancy by a thousand ways of ennobling its object; but the ex- Laomedon pression of this shrick would have totally degraded the statue. It is softened, therefore, into a patient figh, with eyes turned to heaven in fearch of relief. The intolerable agony of fuffering nature is reprefented in the lower part, and particularly in the extremities of the body; but the manly breaft ftruggles against calamity. The contention is still more plainly perceived in his furrowed forehead; and his languishing paternal eve demands affiltance, less for himselfthan for his miferable children, who look up to him for help.

LAODICEA on the Lycus (anc. geog.), a towns of Phrygia, at first called Diospolis, then Rhoas. It was built by Antiochus fon of Stratonice, and called after his confort Laodice. It was long an inconfiderable place; but increased toward the age of Augustus Cæfar, after having suffered in a siege from Mithri-Chandler dates. The fertility of the foil, and the good fortune dia. of fome of its citizens, raifed it to greatness. Hiero. who adorned it with many offerings, left the people his heir to more than 2000 talents. After that benefactor followed Zeno, the rhetorician; and his fon-Polemo, as renowned a fophist as ever lived. Thisperson flourished at Smyrna; but was buried here by the Syrian gate, near which were the fepulchres or coffins of his ancestors. Laodicea, though inland, grew more potent than the cities on the coast, and became one of the largest towns in Phrygia. It was often damaged by earthquakes, and restored by its own opulence or by the munificence of the Roman emperors. These resources failed, and the city, it is probable, became early a scene of ruin. About the year 1007 it was poffessed by the Turks, and submitted to Ducas general of the Emperor Alexis. In 1120 the Turks facked fome of the cities of Phrygia by the Mæander, but were defeated by the Emperor John Comnenus, who took Laodicæa, and built anew or repaired the walls. About 1161 it was again unfortified. Many of the inhabitants were then killed with their bishop, or carried with their cattle into captivity by the Turks. In 1190 the German emperor. Frederick Barbaroffa, going by Laodicea with his army toward Syria on a croifade, was received fo kindly, that he prayed on his knees for the prosperity of the people. About 1196 this region with Caria was dreadfully ravaged by the Turks. The Sultan, on the invasion of the Tartars in 1255, gave Laodicea to the Romans; but they were unable to defend it, and it foon returned to the Turks. It is now totally ruined and deferted. Several remains of its ancient grandeur are, however, still to be feen; particularly the ruins of two theatres and an amphitheatre. - The memory of this place is confecrated in scripture, being one of the feven churches to which St John in the Apocalypse addreffes himfelf, commended by St Paul.

LAODECEA on the fea (anc. geog.), according to Strabo, was a town of Seleucis in Syria, extremely well built, with a commodious harbour. The country about it yielded great quantities of wine. The city took its name from Laodice, mother of Seleucus the

founder of it.

LAOMEDON, king of Troy, whose history is involved in fables. He was fon of Ilus king of Troy; and married Strymo, called by fome Placia, or

Lapathus, by the name of Priam, and Hesione. He built the walls of Troy, and was affifted by Apollo and Neptune, whom Jupiter had banished from heaven, and condemued to be subfervient to the will of Laomedon for one year. When the walls were finished, Laomedon refused to reward the labours of the gods; and soon after his territories were laid waste by the fea or Neptune, and his fubjects were vifited by a peltilence fent by Apollo. Sacrifices were offered to the offended divinities; but the calamities of the Trojans increased, and nothing could appeare the gods, according to the words of the oracle, but annually to expose to a fea monster a Trojan virgin. Whenever the monster appeared, the marriageable maidens were affembled, and the lot decided which of them was doomed to death for the good of her country. When this calamity had continued for five or fix years, the lot fell upon Hefione Laomedon's daughter. The king was unwilling to part with a daughter whom he loved with uncommon tendernefs, but his refufal would irritate more strongly the wrath of the gods. In the midst of his fear and hefitation, Hercules came and offered to deliver the Trojans from this public calamity, if Laomedon would promife to reward him with a number of fine horfes. The king confented; but when the monster was destroyed, he refused to fulfil his engagements, and Hercules was obliged to befiege Troy and take it by force of arms. Laomedon was put to death after a reign of 20 years; his daughter Hesione was given in marriage to 'l'elamon, one of the conqueror's attendants; and Podarces was ranfomed by the Trojans, and placed upon his father's throne. According to Hyginus, the wrath of Neptune and Apollo was kindled against Laomedon, because he refused to offer on their altars as a facrifice all the first born of his cattle, according to a vow he had made.

LAON, a confiderable town of the ifle of France. and capital of the Laonis, with a castle and bishop's fee. Its principal trade confifts in corn and wine; and it is very advantageously feated on a mountain in

E. Long. 3. 42. N. Lat. 49. 34.

LAOS, a kingdom of Afia beyond the Ganges; bounded on the north, by China; on the east, by Tonquin and Cochin-China; on the fouth, by Cambodia; and on the west, by the kingdom of Siam, and by the territories of the king of Ava. This country is full of forests, and abounds in rice, fruits, and fish. The inhabitants are well made, robust, of an olive complexion, and mild in their difposition; but very fuperflitious, and much addicted to women, Their principal occupation is tilling the ground and The king shows himself but twice a year, and has large revenues from the elephant's teeth found in his dominions. Their religion is a kind of idolatry, and much the fame as in China. Langiona is the capital town.

LAPATHUS, LAPETHUS, or Lepithus (anc. geog.); a town of Cyprus, about the middle of its north fide, with a port or station for ships, and a cognominal river. It was built by a colony of Phoenicians, according to Scylax; by Belus king of Tyre, according to Alexander Ephefius. According to Strabo, it was built by a colony of Spartans; and one of the mine kings refided here, the last of whom was Pifistra-

Rhomedon Leucippe, by whom he had Podarces afterwards known tus, who commanded the naval army of Alexander the Lapidary Great. There was a temple here dedicated to Venus. The territory round it is called Lapithia by Diodorus and Ptolemy; Lapithii, the people, tainted with a degree of fatuity; hence Lapathius denotes fatuus, (Hefychius) .- Now a village called Lapitha; but, according to the Abbe Mariti, the longest and most extensive in the island. Besides the advantage of a fine situation, it furnishes the best productions in the country; and though Cyprus is in general not very abundant in fruits, Lapitha feems a favoured spot in this respect. and may be called the garden of the island.

LAPIDARY, an artificer, who cuts precious

The art of cutting precious stones is of great antiquity. The French have carried this art to a very great perfection, but not in any degree superior to the

There are various machines employed in the cutting of precious stones according to their quality. The diamond, which is extremely hard, is cut on a wheel of foft steel, turned by a mill, with diamond dust, tempered with olive-oil, which also ferves to polish it.

The oriental ruby, fapphire, and topaz, are cut on a copper-wheel with diamond dust tempered with olive-oil, and are polished on another copper-wheel with tripoli and water. The hyacinth, emerald, amethylt, garnets, agates, and other stones not of an equal degree of hardness with the other, are cut on a leaden wheel with fmalt and water, and polished on a tin-wheel with tripoli. The turquois of the old and new rock, girafol, and opal, are cut and polished on a wooden wheel with tripoli alfo.

The lapidaries of Paris have been a corporation fince the year 1290. It is governed by four jurats, who superintend their rights and privileges, vifit the mafter-workmen, take care of the mafter-piece of workmanship, bind apprentices, and administer the

freedom.

LADIDARY is also used for a virtuoso skilled in the nature, kinds, &c. of precious flones; or a merchant who deals in them.

LAPIDARY Style, denotes the ftyle proper for monu-

mental or other infcriptions.

This is a kind of medium between profe and verfe : the jejune and the brilliant are here equally to be avoided. Cicero has prescribed the rules of it: Accedat oportet oratio varia, vehemens, plena spiritus. Omnium fententiarum gravitate, omnium verborum ponderibus, est

The lapidary style, which was lost with the ancient monuments, has been retrieved at the beginning of this age by Count Emanuel Teforo; it is now used various ways at the beginning of books; and even epifles dedicatory are composed in it, of which we have no example among the ancients.

LAPIDESCENT, any thing which has the faculty of petrifying, or turning bodies to a ftony nature. Naturalists speak of a lapidescent principle, a lapide-

scent spirit, a lapidescent juice, &c.

LAPIS, in general, is used to denote a stone of

any kind.

LAPIS, in Roman autiquity, a geographical meafure denoting a mile; because miles were distinguished by erecting a stone at the end of each; from the number

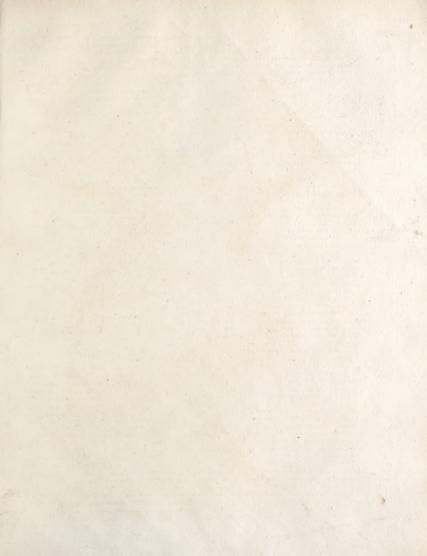

Plate CCLXII.

Antiguan Shrik. LANIUS. Dominican Sh. Jocose Sh. ABell Print Wal Soulpton fevit Tiapland.

number marked on which, the length of way from names of rivers, fuch as Aungnermanland, Elma, Lapland; Rome might be known. The device is by Plutarch afcribed to Caius Gracchus. This was more accurately executed by Augustus, who erected a gilt pillar in the forum, at which all the public ways of Italy, diffinguished by stones, were terminated. The fame thing was done in the Roman provinces. Hence the phrases tertius lapis, centesimus lapis, &c. for three, a hundred, &c. miles; and fometimes the ordinal number without lapis, as ad duodecimum, &c. at tewlve miles LARIS Allius, in the natural history of the ancients,

the name of a ftone called also farcophagus, from its power of confirming flesh. See SARCOPHAGUS. LAPIS Bononiensis, the Bolognian stone. See CHE-

MISTRY, nº 1081, 1082. Lapis Lazuli. See Lazuli.

LAPIS Lyncurius. See LYNCURIUS.

LAPIS Mutabilis. See HYDROPHANES.

LAPIS Hepaticus. See Liver-Stone.

LAPIS Lydius. See Touch-stone, TRAPP, and

Lupis Lypius. LAPIS Obfidianus. See OBSIDIANUS and GALLI-

NACEUS. LAPIS Nephriticus. See JADE-Stone. LAPIS Specularis. See SPECULARIS.

LAPITHÆ, (anc. geog.) a people of Theffaly.

See the next article.

LAPITHUS, (fab. hift.), a fon of Apollo, by Stilbe. He was brother to Centaurus; and married Orfinome, daughter of Euronymus, by whom he had Phorbas and Periphas. The name of Lapithæ was given to the numerous children of Phorbas and Periphas, or rather to the inhabitants of the country of which they had obtained the fovereignty. The chief of the Lapithæ affembled to celebrate the nuptials of Perithous, one of their number. Among them were Thefeus, Dryas, Hopleus, Mopfus, Phalerus, Exadius, Pro. lochus, Titarefius, &c. The Centaurs were also invited to partake the common festivity; and the amuse. ments would have been harmless and innocent, had not one of the intoxicated Centaurs offered violence to Hippodamia the wife of Perithous. The Lapitha refented the injuty, and the Centaurs supported their companions; upon which the quarrel became univerfal, and ended in blows and flaughter. Many of the Centaurs were flain, and they at last were obliged to retire. Thefeus among the Lapithæ showed himself brave and intrepid in supporting the cause of his friends; and Nestor also was not less active in the protection of chastity and innocence. Hesiod has described the battle of the Centaurs and Lapithæ; as has also Ovid, in a more copious manner. The invention of bits and bridles for horfes is attributed to the Lapi-

LAPLAND, the most northerly country of Europe, extending from the north cape in 71° 30' N. Lat. to the White Sea under the arctic circle, is inhabited by the fame people, though the country is Subject to different powers. Norwegian Lapland, under the dominion of Denmark, lies between the northern fea, the river Pais, and the lake Enarak. Swedish Lapland comprehends all the country from the Baltic to the mountains that separate Norway from Sweden. It is divided into fix diffricts, denominated marck or territory; and these are distinguished by the light, by a ferene sky, moon light, and aurora borea-

Peta, Lula, Torna, and Kiemi. The eaftern part, fubject to the Czar of Muscovy, situated between the lake Enarak and the White Sea, is divided into three diffinct prefectures; namely, that of the fea coast towards the north, called Mourmankoi Leborie : the Terfkoi Leporie, upon the coast of the White Sea; and the third, or inland, known by the name of Rellamas refkoi Leporie. In Swedish Lapland, which is the most confiderable of the three, the provinces or marcks are fubdivided into fmaller diffricts called biars, confifting each of a certain number of families; among which the land is parcelled out by government, or the prefect of the diffrict appointed by the king of Sweden.

Lapland may be termed a huge congeries of frightful rocks and stupendous mountains; interspersed, however, with many pleafant valleys, watered by an infinite number of rivulets that run into the rivers and lakes, which discharge themselves into the gulf of Bothnia. The names of the principal lakes in Lapland are the Great Uma, the Great Windel, the Oreavan, the Stor-avan, the Great Lula; the lakesof Kartom, Kali, Torno, Enara, and Kimi, Some of these extend 60 leagues in length, and contain a great number of iflands: Stor-avan is faid to contain 365; and Enara contains an archipelago of islands folarge, that no Laplander has lived long enough to visit each particular island. The natives believe this country to be the terrestrial paradife; and indeed nothing could be more enchanting than fuch vast profpects of mountains, hills, foretts, lakes, rivers, &c. if the country was in a moderate climate: though even here, in fummer the rofes are feen blowing wild on the banks of the lakes and rivers, with all the beautiful glow of colour which appears in those cultivated in our gardens. But all the intervals between the mountains are not ingroffed by thefe agreeable prospects: great part of the flat country is covered with brown dusky forests of fir and pine trees; and these are often skirted by wide extended morasses, the stagnating waters of which in fummer produce myriads of mifchievous infects, that are more intolerable than even the cold of winter.

The cold of Lapland is very intense during the winter, freezing even brandy and the watery part of fpirit of wine, if the latter is not highly rectified: all the lakes and rivers are frozen to a prodigious thickness: and the whole face of the country is covered with fnow to the depth of four or five feet. While this continues loofe, it is impossible to travel; for a man's eyes are not only blinded with it, but if a ftrong wind should rife he will be buried in the drifts of fnow: yet should a partial thaw take place for a few hours, the furface of this fnow is formed by the fucceeding frost into a hard impenetrable cruft, over which the Laplander travels in his fledge with great celerity. While the thaw prevails, the air is furcharged with vapours, and the climate is rainy; but while the north wind blows, the fky is beautifully ferene, and the air very clear.

The heat of fummer is almost as intolerable in Lapland as the cold of winter. At the northern extremity of the country the fun never fets for three months in fummer, and in winter there is an uninterrupted night of the fame duration; but this is qualified in fuch . a manner by a conftant revolution of dawn and twi-

vered with fnow, that the inhabitants are enabled to hunt, fish, and proceed with their ordinary occupations. The country abounds with excellent fprings; and is remarkable for fome furprifing cataracts, in which the water rumbles over frightful precipices, and dashes among rocks with amazing impetuosity and

The foil of Lapland is generally fo chilled and barren, that it produces little or no grain or fruit-trees of any kind. This sterility, however, is not fo much owing to the foil, which is in many places of a rich mould, as to want of industry; for in some districts the Swedes have tilled and manured pieces of ground that bear plentiful crops of rye. There is also great plenty of berries: fuch as black currants; what is called the Norwegian mulberry, growing upon a creeping plant, and much esteemed as an antiscorbutic; rasp-berries, -cran-berries, Juniper berries, and bilberries. tops of the mountains are fo much exposed to intense cold, and tempefts of fnow and hail, that no tree will grow near the fummit; but in parts that are more sheltered, we fee fine woods of birch, pine, and fir, disposed by nature as if they had been planted by art in rows at regular diffances, without any undergrowth or incumbrance below. Besides these trees, some parts of Lapland produce the fervice tree, the willow, the poplar, the elder, and the cornel. Among the plants of this country the principal is the angelica; which is greatly effeemed by the natives, who use it in their food. Here is likewise the acetosa or forrel, which grows in great plenty, and is of much fervice on account of its antiscorbutic properties. They have also other kinds of herbs peculiar to the country, different kinds of grafs, heath, fern, and mofs; which are all enumerated by Linnæus in his Flora Laponica. But the vegetable which is in greatest plenty, and of the most extensive use among them, is the lichen rangiferus. The rein-deer is wholly fustained in winter by this vegetable : and the Laplanders themselves boil it in broth as a cordial and restorative. They likewise use one fort of it as a foft, eafy, and wholesome bed for their newborn children.

Some filver and lead mines have been discovered in the provinces of Pitha and Lula; and two of copper, together with excellent veins of iron, in the diffrict of Torno; but they are not at prefent worked with any confiderable advantage. In some places there are veins of filver and gold mixed; but these mines are worked only for a few months in the summer, because the frost hinders the engines from playing. Here are found beautiful crystals, of a surprising magnitude, so hard and fine, that when polished they resemble real diamonds. In fome places amethylts and topazes are also found, but pale and cloudy; also a great quantity of very curious stones, which are too hard to be worked by the tool of the mason. Some of these found on the banks of rivers and lakes, when they happen to bear the least refemblance to the figures of animals, the Laplanders remove to more conspicuous places, and adore as deities. The province of Torno affords fome curious stones of an octagonal shape, regular, fhining, and polished by the hand of nature. In some rivers they fish for pearls, which are generally pale; but fome of them are as bright as the oriental pearls Nº 175.

Lapland lis, reflected from the white furface of the earth co- and much larger and rounder. These pearls are found Lapland. in muscle-shells; and the fishery is not in the sea, but in rivers.

Lapland, as well as Norway, is infefted with a great number of grey wolves and bears, with whom the inhabitants wage perpetual war. The most honourable exploit among the Laplanders is that of killing a bear; and the heroes adorn their caps with a small plate of lead or pewter for every bear they have flain. The country abounds also with elks, beavers, and otters, which live here unmolested, and find plenty of fish for their sublistence. The forests of this country furnish haunts to a great number of beautiful martens and fquirrels; which last change their colour every winter from brown to grey. Lapland is also the native country of the zibeling or sable, whose skin is extremely valuable. Here are likewise ermines, weafels, hares, large black cats which attend the Laplanders in hunting, and little prick-eared curs trained to the game. But the most remarkable animal of Lapland is the reindeer, of which an account is given in the article CERVUS no 4. These animals, so useful in various respects to the natives, are kept at no expence. In fummer they feed upon graffes and alpine plants; in winter, as already mentioned, upon the lichen rangiferus, or rein-deer lichen, and its varieties, which are fo abundant as in many parts almost totally to cover the ground for the space of feveral miles, and which the fagacious animal difcovers under the fnow by the peculiar acuteness of its fmell. Most of those used for draught are castrated when very young, and are larger and fatter than the bucks. The woods, mountains, and rivers are well stocked with wild-fowl; fuch as bustard, partridge, growfe, heathcock, pheafants, lapwings, fwans, wildgeefe, wild-ducks, and all forts of aquatic birds that build and breed in northern climates. In the beginning of the fpring the fwaus go thither in numerous flights from the German ocean; the lap wings follow in fuch fwarms that they darken the fky as they pass along, and fcream fo loud that they may be heard at a great distance. The rocks and mountains are likewise frequented by eagles, hawks, falcons, kites, and other birds of prey .- The rivers abound with delicious falmon from the gulph of Bothnia, trout, bream, and perch of exquifite flavour and amazing magnitude; and the inhabitants of Wardhus, or Danish Lapland, are well supplied with fish from the northern ocean-With respect to insects, the slies hatched in the moraffes and woods in fummer are fo numerous, that they often obscure the face of day; so venomous, troublefome, and intolerable, that the rein-deer fly to the tops of the highest mountains for shelter, and the Laplanders betake themselves to the sea-side, which is the least infested by these pestilent vermin. M. de Maupertuis, in his account of the voyage he made to Lapland, in company with the other French mathematicians fent thither by the king to measure a degree of the meridian, gives us to understand, that on the tops of the mountains in Torno the flies were fo troublesome, that even the Finland foldiers, who are counted the most hardy troops in the service of Sweden, were obliged to cover their faces with the skirts of their coats from the attacks of these animals, which swarmed to such a degree, that the moment a piece of flesh appeared it was blackened all

Lapland. over. Some of these flies are very large, with green heads, and fetch blood from the fkin wherever they firike. The Laplanders shroud themselves in the smoke of a large fire kindled for that purpose; yet even this difagreeable expedient was not sufficient to defend the French philosophers: they were obliged, notwithstanding the excessive heat, to wrap up their heads in garments made of the fkins of rein-deer, called in that country lapmudes, and to cover themselves with a thick rampart of fir boughs : yet all these precautions proved ineffectual. M. de Maupertuis observed a lake quite covered with little vellowish grains, resembling millet feed, which he supposed to be the chrysalifes of some of these insects.

> The Laplanders are very low in stature, and are likewise remarkable for having large heads. They are also ill shaped, and their features harsh. They are, however, ftrong, hardy, and robust, infomuch that they will bear incredible fatigue; and it is remarked that the stoutest Norwegian is not able to bend the bow of a Laplander. The women are much less homely than the men, and many of them are noted for a

delicate and florid complexion.

These people are simple, honest, hospitable, and timorous: their timidity, however, respects war alone; for to many other species of dangers they expose themfelves with furprifing intrepidity, whether in afcending and descending mountains and precipices with their fnow-shoes and in sledges, or in venturing amidst whirlpools and cataracts in little flender boats made of thin fir-boards, fastened together with thongs of leather, finews of wild beafts, or tough and flexible twigs of willow and ofier. These boats are of different fizes. from two to fix yards in length, managed with oars, and caulked with mofs fo tight as to keep out the water. The Laplanders are partly fettled, and in part wild and roving: the latter live in tents made with coarfe cloth; the former are fixed in fmall villages near the lakes, and chiefly follow fishing. They build their cottages fomewhat in the shape of a cone, by placing a circle of large trees or poles aslant in the earth, and close to each other, so that their tops meet, and form a fmall vent for the iffue of the fmoke : they cover the ground within with branches of trees. In fpring their food confifts principally of the eggs of water-fowl, which are extremely plentiful in those parts; in summer and autumn, of the birds themselves, and of various other of the partridge-tribe; and in winter of the milk and flesh of the rein deer and dried fish. They had till lately no bread; but in lieu thereof used the inner rind of the pine-tree dried and ground, and dried fish reduced to powder. They make confections and decoctions of berries, angelica, and forrel, which they juftly reckon to be prefervatives against the scurvy. The Laplander is secured in the possession of uninterrupted health by temperance and exercise, which, together with the feverity of the climate, brace his nerves to a very unufual pitch of strength, and fortify his constitution in fuch a manner, that he often lives to the age of 100, without feeling the least pang of diftemper, or even perceiving his vigour in the leaft impaired; for it is not uncommon to fee a Laplander in extreme old age hunting, fowling, skaiting, and performing all the feverest exercises with undiminished agility.

Vol. IX. Part. II.

The fummer garb of the men confifts of a long Lapland coat of coarse cloth, reaching down the middle of the leg, and girded round the waift with a belt or girdle : from which hang a Nerway knife, and a pouch containing flints, matches, tobacco, and other necessaries; the girdle itself being decorated with brass rings and chains. Their caps are made of the skin of the northern diver, with the feathers on; and their shoes of the rein-deer skin, with the hair outwards. They wear no linen; but the garments of the better fort are of a finer cloth, and they delight in a variety of colours, though red, as the most glaring, is the most agreeable. In winter they are totally cased up in coats, caps, boots, and gloves, made of the rein-deer skins. In the Flora Lapponica, Linnæus fays, " Perhaps the curious reader will wonder how the people in Lapland, during the terrible cold that reigns there in winter. can preserve their lives; fince almost all birds, and even fome wild beafts, defert it at that time. The Laplander, not only in the day, but through the whole winter nights, is obliged to wander about in the woods with his herds of rein-deer. For the reindeer never come under cover, nor eat any kind of fodder, but a particular kind of liverwort. On this account the herdimen are under a necessity of living con tinually in the woods, in order to take care of their cattle, left they should be devoured by wild beafts. The Laplander eafily does without more light, as the fnow reflects the rays that come from the ftars, and as the Aurora Borealis illuminates the air every night with a great variety of figures. No part of our body is more eafily destroyed by cold than the extremities of the limbs, which are most remote from the fun of this microcosm, the heart. The kibes that happen to our hands and feet, fo common in the northern parts of Sweden, prove this. In Lapland you will never fee fuch a thing; although were we to judge by the fituation of the country, we should imagine just the contrary, especially as the people wear no stockings, as we do, not only fingle, but double and triple. The Laplander guards himfelf against the cold in the following manner. He wears breeches made of rein-deer skins with the hair on, reaching down to his heels, and shoes made of the same materials, the hairy part turned outwards. He puts into his shoes slander eared broad-leafed cyperus grafs, (carex veficaria, Spec. Pl. or the Bladder Carex), that is cut in fummer and dried. This he first combs and rubs in his hands, and then places it in such a manner that it not only covers his feet quite round, but his legs also; and being thus guarded, he is quite fecured against the intense cold. With this grass they stuff their gloves likewise, in order to preferve their hands. As this grafs keeps off the cold in winter, fo in fummer it hinders the feet from fweating, and at the fame time preferves them from being annoyed by ftriking against stones, &c. for their shoes are very thin, being made, not of tanned leather, but the raw hide." The womens apparel differs very little from that of

the other fex; only their girdles are more ornamented with rings, chains, needle-cases, and toys that sometimes weigh 20 pounds. In winter, both men and women lie in their furs; in fummer, they cover themfelves entirely with coarse blankets to defend them from the gnats which are intolerable. The Laplanders They make all their own furniture, their boats, fledges. bows and arrows. They form neat boxes of thin birch boards, and inlay them with the horn of the rein deer. The Swedes are very fond of the Lapland baskets made of the roots of trees, flit in long thin pieces, and twifted together fo nicely that they will hold water. Among the manufactures of this country we likewife number curious born-fooons, and moulds in which they call the trinkets of tin which adorn their girdles. Over and above these domestic occupations, the men within doors perform the office of cooks in drefling victuals for the family. The women act as taylors and embroiderers; they make clothes, shoes, and boots, and harness for the rein deer: they spin thread of fur, and knit it into caps and gloves that are very foft and warm. They draw tin into wire through a horn; and with this they cover the thread which they use in embroidering the figures of beafts, flowers, trees, and

The Laplanders make furprifing excursions upon the fnow in their hunting expeditions. They provide themselves each with a pair of skates, or snow. shoes, which are no other than fir-boards covered with the rough skin of the rein-deer, turned in such a manper that the hair rifes against the snow, otherwise they would be too flippery. One of these shoes is usually as long as the person who wears it; the other is about a foot shorter. The feet stand in the middle. and to them the shoes are fastened by thongs or withes. The Laplander thus equipped wields a long pole in his hand, near the end of which there is a round ball of wood to prevent its piercing too deep in the fnow; and with this he stops himself occasionally. By means of these accourrements he will travel at the rate of 60 miles a-day without being fatigued; afcending fleep mountains, and fliding down again with amazing

flars upon their caps and girdles.

The Laplander not only travels a-foot, but is provided with a carriage drawn by the rein-deer, in which he journeys with fill greater rapidity. The fledge, called pulka, is made in the form of a small boat, with a convex bottom, that it may flide the more eafily over the fnow: the prow is sharp and pointed; but the fledge is flat behind. The traveller is fwathed in this carriage like an infant in a cradle, with a flick in his hand to fleer the veffel, and difengage it from pieces of rock or flumps of trees that may chance to encounter it in the route. He must also balance the sledge with his body, otherwise he will be in danger of being overturned. The traces, by which this carriage is fastened to the rein-deer, are fixed to a collar about the animal's neck, and run down over the breaft between the fore and hind legs, to be connected with the prow of the fledge; the reins, managed by the traveller, are tied to the horns; and the trappings are furnished with little bells, the found of which is agreeable to the animal. With this draught at his tail, it has been reported that the rein-deer will fly like lightning over hill and dale at the rate of 200 miles a-day. But this representation is greatly exaggerated. According to the best accounts, the common pace of the rein-deer is only at the rate of about four miles an hour; though, if he be pressed, he will travel 10 or 12 Swedish miles (70 or 84 English miles) in a day; but by such hard

Lapland, are not only well disposed, but naturally ingenious, driving is generally destroyed. It, however, free Lapland. quently happens, that he will persevere in his journey 50 miles without intermiffion, and without taking any refreshment, except occasionally moiltening his mouth with the fnow. Before he fets out, the Laplander whifpers in his ear the way he is to follow, and the place at which he is to halt, firmly perfuaded that the beaft understands his meaning : but, in spite of this intimation, he frequently ftops foort long before he has reached the journey's end; and fometimes he overshoots the mark by feveral leagues. In the beginning of winter the Laplanders mark the most frequented roads, by strewing them with fir-boughs; and indeed these roads are no other than pathways made through the fnow by the rein-deer and the pulkhas: their being frequently covered with new fnow, and alternately beaten by the carriage, confolidates theminto a kind of caufeway; which is the harder if the furface lias felt a partial thaw, and been crufted by a fubfequent frost. It requires great caution to follow theie tracts; for if the carriage deviates to the right or left, the traveller is plunged into an abyls of fnow. In less frequented parts, where there is no such beaten road, the Laplander directs his course by certain marks which he has made on the trees.

The chief occupation of the Laplanders is hunting. and this exercise they perform in various ways. In fummer they hunt the wild beafts with small dogs, trained to the diversion. In winter they pursue them by their tracks upon the fnow, skating with so great velocity, that they very often run down the prey. They catch ermines in traps, and fometimes with dogs, They kill fquirrels, martens, and fables, with blunt darts, to avoid wounding the skin. Foxes and beavers are flain with fharp pointed darts and arrows: in shooting which, they are accounted the best marksmenin the world. The larger beafts, fuch as bears, wolves, elks, and wild rein-deer, they either kill with firearms purchased in Sweden or Norway, or take in fnares and pits dug in the forests. Their particular. laws relating to the chace are observed with great punctuality. The beaft becomes the property of the man in whose snare or pit he is caught; and he who discovers a bear's den has the exclusive privilege of hunting him to death. The conquest of a bear is the most honourable atchievement that a Laplander can perform; and the flesh of this animal they account the greatest delicacy on earth. The bear is always difpatched with a fufil, fometimes laid as a fnare, ready cocked and primed; but more frequently in the hands of the hunter, who runs the most imminent risk of his life should he miss his aim of wounding the beaft mortally. The death of a bear is celebrated by the Laplanders as a fignal victory. The carcase is drawn to the cabin or hut of the victor by a rein deer, which is kept facred from any other work for a whole year after this fervice. The bear is furrounded by a great number of men, women, and children, reciting a particular hymn or fong of triumph, in which they thank the vanquished enemy for having allowed himself to be overcome without doing any mischief to his conqueror, and welcome his arrival: then they make an apoftrophe to heaven, exprefing their acknowledgment to God, that he has created beafts for the use of men, and endued mankind with frength and courage to over-

Lapland come and attack the hercest of the brute creation. The and healthy, are not altogether exempted from dif. Lapland. hero is faluted by the women, who foit chewed elder temper. They are fubicat to fore eyes, and even to bark in his face. He is feasted three days successive- blindness, from the smoke of their huts, and the fire ly, and his cap is decorated with an additional figure to which they are almost continually exposed. Some wrought in tin wire.

The manner in which the young Laplander chooses a wife is equally remarkable and ludicrous. When he has pitched upon a female, he employs fome friends as mediators with the father; and thefe being provided with fome bottles of brandy, the fuitor accompanies them to the hut of his future father-in-law, who invites the mediators to enter; but the lover is left without until the liquor be drank, and the propofal difcuffed; then he is called in, and entertained with such fare as the hut affords; yet without feeing his miftrefs, who retires and goes out on this occasion. Having obtained leave of her parents to make his addresses in person, he puts on his best apparel, and is admitted to the lady, whom he falutes with a kifs; then he prefents her with the tongue of a rein deer, a piece of beaver's flesh, or some other fort of provision. She declines the offer, which is made in prefence of her fifters and relations; but makes a fignal to the lover to follow her into the fields, where the accepts the prefents. Thus encouraged, he begs her permission to fleep with her in the hut : if the confents, there is no further difficulty; if the difapproves of the propoial, the drops her prefents on the ground. When the lovers are agreed, the youth is permitted to vifit his inamorata as often as he shall think proper: but every time he comes, he must purchase this pleasure with a fresh bottle of brandy; a perquisite so agreeable to the father, that he often postpones the celebration of the nuptials for two or three years. At length the ceremony is performed at church by the priest of the parish. Even after this event, the husband is obliged to ferve his father-in-law a whole year; at the expiration of which he retires to his own habitation with his wife. and her patrimony of rein-deer, and receives prefents from all his friends and relations. From this period he sequetters his wife from the company of all strangers. especially of the male sex, and watches over her conduct with the most jealous vigilance.

Many Lapland women are barren, and none of them are very fruitful. A woman, immediately after delivery, fwallows a draught of whale fat: the child is washed with snow or cold water, and wrapped up in a hare skin. The mother is feldom above five days in the straw, and in fourteen is generally quite recovered: then the carries the child to church to be baptized. Before the can reach the refidence of the prieft, the is often obliged to traverse large forests, mountains, lakes, and wide-extended wastes of snow. The infant is faftened in a hollowed piece of wood, thretched naked on a bed of fine mois, covered with the foft skin of a young rein deer, and flung by two ftraps to the back of the mother, who always fuckles her own child. At home this little cradle is hung to the roof of the hut, and the child lulled afleep by fwinging it from one fide to the other. The boys from their infancy practife the bow; and are not allowed to break their falt until they have hit the mark. The female children are as early initiated in the business peculiar to their

waste away in confumptions; others are afflicted with rheumatic pains and the fourvy; and a few are fubject to vertigo and apoplexy. For the cure of all their internal diforders, they use no other medicine than the decoction of a certain species of moss; and when this cannot be procured, they boil the falk of angelica in the milk of the rein-deer. In order to remove a fixed pain, they apply a large mushroom, burning hot, to the part affected; and this produces a blifter, which is supposed to draw off the peccant humour. To their wounds they apply nothing but the turpentine that drops from the fir-tree. When they are frost bitten, (though according to the above extract from Linnæus this feldom or never happens), we are told that they thrust a red hot iron into a cheese made of reindeer's milk, and with the fat that drops from it anoint the frozen member, which generally recovers. When a Laplander is supposed to be on his death bed, his friends exhort him to die in the faith of Chrift, and bear his fufferings with refignation, by remembering the passion of our Saviour. They are not, however, very ready to attend him in his last moments; and as foon as he expires, quit the place with precipitation, apprehending fome injury from his fpirit or whoft, which they believe remains with the corple, and takes all opportunities of doing mischief to the living. The deceased is wrapped up in woollen or linen, according to his circumstances, and deposited in a coffin by a person selected for that purpose: but this office he will not perform, unless he is first secured from the ill offices of the manes, by a confecrated brafs ring fixed on his left arm. The Christian religion in this country has not yet dispelled all the rites of heathenish fuperfition: together with the body they put into the coffin an ax, a flint, and fteel, a flask of brandy, fome dried fish and venison. With the ax the deceased is fupposed to hew down the bushes or boughs that may obstruct his passage in the other world : the steel and flint are defigned for flriking a light, should he find himself in the dark at the day of judgment; and on the provision they think he may subsist during his

The Muscovite Laplanders observe other ceremonies. that bear an affinity to the superstitions of the Greek church. They not only supply the defunct with money, but likewife provide him with money for the porter of paradife, and a certificate figned by the prieft, and directed to St Peter, specifying, that the bearer had lived like a good Christian, and ought to be admitted into heaven. At the head of the coffin they place a little image of St Nicholas, who is greatly reverenced in all parts of Muscovy as a friend to the dead. Before the interment, the friends of the deceafed kindle a fire of fir boughs near the coffin, and express their forrow in tears and lamentations. They walk in proceffion feveral times round the body, demanding, in a whining tone, the reason of his leaving them on earth. They ask whether he was out of humour with his wife; whether he was in want of meat. drink, clothing, or other necessaries; and whether These people, though for the most part vigorous he had not succeeded in hunting and fishing? These,

572

makes no reply, are intermingled with groans and hideous howlings; and, between whiles, the prieft forinkles the corple and the mourners alternately with holy water. Finally, the body is conveyed to the place of interment on a sledge drawn by a rein-deer; and this, together with the cloaths of the decoafed, are left as the prieft's perquifite. Three days after the burial, the kinfmen and friends of the defunct are invited to an entertainment, where they eat the flesh of the rein-deer which conveyed the corpfe to the burying-ground. This being a facrifice to the manes, the bones are collected into a basket and interred. Two thirds of the effects of the deceafed are inherited by his brothers, and the remainder divided among his fifters: but the lands, lakes, and rivers, are held in coparceny by all the children of both fexes, according to the division made by Charles IX. of Sweden, when he affigned a certain tract of land to each

family. The commerce of the Laplanders is more considerable than one would expect in a defart country inhabited by a favage ignorant people. They export great quantities of fish to the northern parts of Both; nia and White Ruffia. They likewife trade with the neighbouring countries of Norway, Sweden, Muscovy, and Finland, by felling rein-deer, fine furs, bafkets and toys of their own manufacture, dried pikes, and cheefe made of the rein-deer's milk. In return for these commodities they receive rixdollars, woollen cloaths, linen, copper, tin, flour, oil, hides, needles, knives, fpirituous liquors, tobacco, and other necessaries. The Laplanders march in caravans to the fairs in Finland and Norway: these are composed of a long string of 30 or 40 rein deer and pulkhas tied to one another, the foremost being led by a Laplander a-foot. When they have chosen a fpot for an encampment, they form a large circle of their rein-deer and pulkhas ready yoked; and the animals lying down quietly on the fnow, are fed with moss by their ma-The people kindle great fires, around which, men, women, and children fit, and fup on dried fish: but the more voluptuous fpread out bear-skins under their tents, where they lie at their ease and fmoke tobacco.

The revenue arising from this country is of no great confequence: it is paid partly in rix-dollars, but chiefly in furs; nay, fome that can procure neither, pay the tribute in dried pikes. The produce of the mines forms likewise a considerable article. Fifty squirrelskins, or one fox-skin, with a pair of Lapland shoes, are valued at one rixdollar. Part of the taxes is allotted for the maintenance of the Lapland clergy .- The frightful aspect of this country has been deemed a more effectual defence than artificial bulwarks and garrisons, of which here are none; or than the arms and themselves, nor in the least tinctured with discipline.

Lapland, and other such interrogations, to which the defunct Lapland contains about eight churches, which in some Laplysia parts lie at fo great a distance from each other, that a native is frequently obliged to travel three days in or-der to attend divine fervice. The Laplanders, before their conversion to Christianity, which was not till lately introduced amongst them, possessed no books or manuscripts, though they knew many traditional hiftories and fongs of ancient heroes and princes who once reigned over them; but involved in great uncertainty, and mixed with the most fabulous accounts. They have now a translation of the New Testament in their language; and many of the natives are able to read and write.

LAPLYSIA, or SEA HARE; a genus of marine Plate infects belonging to the order of vermes mollufca. The CCLXIIZ body is covered with membranes reflected. It hath a shield-like membrane on the back, a lateral pore on the right fide, the anus on the extremity of the back, with four feelers refembling ears. The figure reprefents the depilans minor, which grows to two inches and a half in length, and to more than an inch in diameter: its body approaches to an oval figure, and is foft, punctated, of a kind of gelatinous substance, and of a pale lead colour; from the larger extremity there arise four oblong and thick protuberances: these are the tentacula; two of them fland nearly erect, two are thrown backward. It is not uncommon about our shores, especially off Anglesea. It causes, by its poifonous juice, the hair to fall off the hands of those that touch it and is fo extremely fetid as to create fickness at stomach .- The major, or greater fea-haie, grows to the length of eight inches.

LAPSANA, NIPPLEWORT: A genus of the polygamia æqualis order, belonging to the fyngenefia class of plants; and in the natural method ranking under the 49th order, Composite. The receptacle is naked : the calyx caliculated, with all the inferior fcales canaliculated or finely channelled. There are four fpecies. which grow commonly as weeds by the fides of ditches. The young leaves of the common kind, called dock-creffes, have the tafte of radishes, and are eaten raw at Constantinople as a salad. In some parts of England the common people boil them as greens, but they have a bitter and disagreeable taste.

LAPSE, in ecclefiaftical law, a flip or omiffion of a patron to prefent a clerk to a benefice within fix months of its being void: in which case, the benefice is faid to be in lapfe, or lapfed, and the right of prefentation devolved to the ordinary.

And if the ordinary neglect to prefent during the fame time, the right of prefentation accrues to the metropolitan, and to the king by neglect of the metropolitan. This right of lapfe was first established in the reign of Henry II. when the bishops first began toexercise univerfally the right of inflitution to churches: and therefore when there is no right of institution, courage of the natives, who are neither warlike in there is no right of lapfe; fo that no donative can lapfe to the ordinary, unless it hath been augmented The Laplanders call themselves Salme Same, and Sa- by the king's bounty; but no right of lapse can acmen-Almatjeb. Larwing fufficiency, these being matters of which the bishop to have a higher degree of guilt than simple larceny. Larceny, then it falls under another description, viz. that of burglary, (fee BURGLARY). But now by feveral acts of parliament (the hiftory of which is very ingeniously deduced by a learned modern writer +, who hath + Barr. shown them to have gradually arisen from our im- 375. provements in trade and opulence), the benefit of clergy is taken from larcenies committed in an house in almost every instance: except that larceny of the stock or utenfils of the plate-glass company from any of their houses, &c. is made only fingle felony, and liable to transportation for feven years. The multiplicity of the general acts is apt to create fome confusion; but upon comparing them diligently, we may collect, that the benefit of clergy is denied upon the following domestic aggravations of larceny; viz. first, in larcenies above the value of twelvepence, committed, 1. In a church Blackft. or chapel, with or without violence, or breaking the Comments. fame: 2. In a booth or tent in a market or fair, in the day time or in the night, by violence or breaking the same, the owner or some of his family being therein: 3. By robbing a dwelling-house in the daytime (which robbing implies a breaking), any person being therein: 4. In a dwelling-house by day or by night, without breaking the fame, any perfon being therein and put in fear; which amounts in law to a robbery: and in both these last cases the accessory before the fact is also excluded from his clergy. Secondly, in larcenies to the value of five shillings, committed, 1. By breaking any dwelling-house, or any out house, shop, or warehouse thereunto belonging, in the day-time, although no person be therein; which also now extends to aiders, abettors, and accessories before the fact: 2. By privately stealing goods, wares, or merchandise in any fhop, warehouse, coach-house, or stable, by day or by night; though the fame be not broken open, and though no person be therein: which likewise extends to fuch as affift, hire, or command the offence to be committed. Lastly, in larcenies to the value of LAR-BOARD, among feamen, the left-hand fide forty stillings in a dwelling house, or its out houses, although the fame be not broken, and whether any perfon be therein or not; unless committed against their masters by apprentices under the age of 15. This also.

extends to those who aid or affilt in the commission of any fuch offence. 2. Larceny from the person, is either by privatelyftealing, or by open and violent affault, which is ufu-

ally called robbery.

The offence of privately stealing from a man's per-I. Simple larceny, when it is the flealing of goods fon, as by picking his pocket or the like, privily, withguished in their punishment, but not otherwise. Lardner.

practifed (even in the queen's court and prefence) at the time when this flatute was made : besides that this is an infringement of property in the manual occupation or corporal possession of the owner, which was an offence even in a flate of nature. And therefore the faccularii, or cutpuries, were more feverely punished than common thieves by the Roman and Athenian

As to open and violent larceny from the person, see ROBBERY.

LAR, a town of Perfia, in the province of Fars, with a cafile. It carries on a great trade in filk; and its territory abounds in oranges, lemons, and very large tamarinds. E. Long. 54. 15. N. Lat. 27. 30.

LARACHA, an ancient and strong town of Africa, in the kingdom of Fez. It is feated at the mouth of a river of the same name, with a good harbour. It was once in the poffession of the Spaniards; but the Moors took it from them. W. Long. 5. 55. N. Lat.

LARDNER (Nathaniel), an eminent English diffenting divine, was born at Hawkhurft in Kent, June 6. 1684. After a grammatical education, to which great attention must have been given, and in which a no less rapid progress must have been made, he was fent first to a diffenting academy in London, which was under the care of the Rev. Dr Joshua Oldfield; and thence, in his 16th year, to profecute his studies at Utrecht, under the celebrated professors D'Uries, Grævius, and Burman. Here he remained fomewhat more than three years, and then removed for a short fpace to Leyden. In 1703 he returned to England, continuing at his father's house to employ himself by close and diligent preparation for the facred profession which he had in view Qualified as he was, it was not till 1709 that he preached his first fermon, from Romans i. 16 .- " a text (his biographer remarks) than which there could not have been a more proper one for a man who was deflined in the order of Divine Providence to be one of the ablest advocates for the authenticity and truth of the Christian revelation that ever existed."

A few years after this, Lardner was received into Lady Treby's family as domestic chaplain and tutor to her fon, and continued in this comfortable fituation till her ladyfhip's death in 1721 This event threw him into circumstances of some perplaxity, having preached to feveral congregations during his relidence with Lady Treby without the approbation or choice of any one congregation. Here we are told, " that it reflects no honour on the Diffenters, that a man of fuch merit flould fo long have been negle eted." But it has been observed upon this, that the pulpit was not the place in which Mr Lardner was calculated either to convey improvement or acquire reputation. Dr Kippis afterwards informs us, " that his mode of elocution was very unpleafant; that from his early and extreme deafness he could have no such command of his voice as to give it a due modulation; and that he greatly dropped his words." It cannot then, as his biographer adds, be matter of furprise that he was not popular; nor, it may be added, can it be any reflection on the congregations to which he occasionally preached, that they did not choose for their minister a man, who, notwithflanding his great learning and amiable in divinity which has lately been published by Dr Wat-

virtues, was fo deficient as a public fpeaker, that it Lardner, was impossible to hear him with any pleasure, and fearcely without pain.

Though Mr Lardner had no church at which he officiated as minister, he was engaged with some of his diffenting brethren in preaching a Tuefday evening lecture at the Oli Jewry. Acquainted probably with the direction of his studies, they appointed him to preach on the proof of the Gredibility of the Gofpel Hiflory. This he discussed, we are told, in two sermons; and profecuting the fubject which he had taken up in thefe discourses, in Feb. 1727, he published, in two volumes octave, the First Part of " The Credibility of the Gospel History, or the Facts occasionally mentioned in the New Teltament confirmed by Paffages of ancient Authors who were contemporary with our Saviour or his Apostles, or lived near their Time." An Appendix was subjoined, relating to the time of Herod's death.

Thus Mr Lardner commenced author, and began his literary career with fingular reputation. " It is fcarcely necessary to fay (observes Dr Kippis), how well this work was received by the learned world. Not only was it highly approved by the Protestant Diffenters, with whom the author was more inimediately connected, but by the clergy in general of the eftablifhed church; and its reputation gradually extended into foreign countries. It is indeed an invaluable performance, and hath rendered the most effential service to the cause of Christianity. Whoever peruses this work (and to him that does not peruse it, it will be to his own lofs) will find it replete with admirable instruction, found learning, and just and candid criticifm." These two, with the subsequent fifteen, volumes octavo, and the four thin quartos intitled Jewifb and Heathen Testimonies, occupied him, with the interruption ariting from fome fmaller productions, during the space of forty-three years.

D. Kippis gives us a particular account of the time when each volume was published, and of the subjects discussed in each. The following useful information which the Doctor introduces, in speaking of the "Supplement to the Credibility," deserves well to be transcribed. " I cannot avoid fliongly recommending this work (fays he) to the attention of all young divines. Indeed, I think that it ought to be read by every theological student before he quits the university or academy in which he is educated. There are three other works which will be found of eminent advantage to those who are intended for, or beginning to engage in, the Christian ministry. These are, Butler's Analogy, Bishop Law's Considerations on the Theory of Religion, and Dr Taylor's Key to Apostolical Writings, prefixed to his Paraphrase on the Epitle to the Romans. Without agreeing with every circumstance advanced in these works, it may be faid of them with the greatest truth, that they tend to open and enlarge the mind; that they give important views of the evidence, nature, and delign of revelation; and that they display a vein of reasoning and inquiry which may be extended to other objects besides those immediately confidered in the books themselves .- It must not be forgotten, that the Supplement to the Credibility has a place in the excellent collection of treatifes

fom

Monthly Jan. 1789 Lares

fon bishop of Landaff. For a collection which cannot fail of being eminently conducive to the inftruction and improvement of younger clergymen, and for the noble, manly, and truly evangelical preface by which it is preceded, this great prelate is entitled to the gratitude and families: thefe they also called Praflites, from of the Christian world." It may not be improper to add, that the Supplement to the Credibility was fome years are published separately by the bookscilers, under the title of The History of the Gospels and Epifles.

Applauded as Dr Lardner's works were, he received little recompence for them. Some of the latter volumes of the Credibility were published at a loss; and at last he fold the copy-right and all the remaining printed copies to the bookfellers, for the trifling fum of L.150. His object, however, was not private emolument, but to ferve the interefts of truth and virtue; and it pleafed Divine Providence to spare his life, both to complete his extersive plan, and to see the last volume, the 4th of the Testimonies, published. This was in 1767. He was feized with a decline in the fummer following; and was carried off in a few days at Hawkhurit, the place of his nativity, where he had a small parernal estate, in the 85th year of his age.

LAREDO, a fea-port town of Spain, in the bay of Biscay, with a large safe harbour. It is 30 miles west of Bilboa, and 72 north by west of Burgos. W.

Long. 3. 45. N. Lat. 43. 23.

LARENTINALIA, fin antiquity, a feaft held among the Romans on the 23d day of December, but ordered to be obscrved twice a year by Augustus; by fome supposed to have been in honour of the Lares, but by others, with more probability, in honour of Acca Laurentia; and to have been the fame with Laurentalia.

LARES, among the ancients, derived by Apu-Icius (De Deo Socratis), from lar, familiaris; a kind of domestic genii, or divinities, worshipped in houses, and efteemed the guardians and protectors of families; fupposed to refide more immediately in the chimney

corner.

The Lares were diftinguished from the Penates; as the former were supposed to prefide over house-keeping, the fervants in families, and domestic affairs; and the latter were the protectors of the mafters of families, their wives and children. Accordingly the Lares were dreffed in short succinct habits, to show their readiness to serve; and they held a fort of cornucopia in their hands, as a fignal of hospitality and good house keeping. According to Ovid, there were generally two of them, who were fometimes reprefented with a dog at their feet.

Plutarch diftinguishes good and evil Lares, as he had before done good and evil Genii .- There were

alfo fome public; others private Lares.

Apuleius tells us the domestic Lares were no more than the fouls of departed perfons, who had lived well, and discharged the duties of their station; whereas those who had done otherwise, were vagabonds, wandering about and frightening people, called Larva and

The Lares were also called Penates, and were worshipped under the figures of little marmoufets, or ima-

ges of wax, filver, or earthen ware.

The public Lares were also called Combitales, from compitum " a crofs-way;" and Viales, from via " a way

or public road;" as being placed at the meetings of Lares. roads and in the high-ways, and effected the patrons and protectors of travellers.

Their private Lares took care of particular houses

Qued praftant oculis omnia tuta fuis. Ovid Faft.

They gave the name Urbani, i.e. "Lares of cities." to those who had cities under their care : and Hollilia to those who were to keep their enemies off. There were also Lares of the country, called Rurales, as appears by feveral antique inferiptions.

The Lares were also genial gods, and were supposed to take care of children from their birth. It is for this reason that when Macrobius tells us the Egyptians had four gods who prefided over the birth of children, viz. the Genius, Fortune, Love, and Necessity, called Prastites, some interpret him as if he had said the Egyptians had Lares; but they have mentioned that there was a great difference between the Lares of the Romans and the Præstites of the Egyptians. However, the learned Mr Bryant affirms that they were the

The ancients differ extremely about the origin of the Lares. Varro and Macrobius fay that they were the children of Mania; Ovid makes them the iffne of Mercury, and the Naiad Lara, or Larunda: Apuleina affures us they were the posterity of the Lemures; Nigridius, according to Arnobius, made them fometimes the guardians and protectors of houses, and sometimes the same with the Curetes of Samothracia, which the Greeks call Idai dallyli Nor was Varro more confiftent in his opinion of these gods; sometimes making them the manes of heroes, and fometimes gods of the air.

T. Tatius king of the Sabines, was the first who built a temple to the Lares. The chimney and fireplace in the house were particularly consecrated to

Tertullian tells us, the custom of worshipping the Lares arose from this, that they anciently interred their dead in their houses; whence the credulous people took oecasion to imagine their fouls continued there also, and proceeded to pay them divine honours. To this it may be added, that the custom being afterwards introduced of burying in the highways, they might hence take occasion to regard them as gods of the highways.

The victim offered to the Lares in the public facrifices was a hog : in private, they offered them wine, incenfe, a crown of wool, and a little of what was left at the table. They also crowned them with flowers, particularly the violet, myrtle, and rofemary. Their fymbol was a dog, which was ufually reprefented by their fide, on account of its fidelity and the fervice it does to man in watching his house. They were fometimes also represented as clothed in a dog's

The term Lares, according to Mr Bryant, wasformed from laren, an ancient word by which the ark was represented: and he supposes that the Lares and Manes were the fame domeftic deities under different names; and that by thefe terms the Hetrurians and Latins denoted the disarkita, who were no other than their arkite ancestors, or the persons preserved in the laren or ark; the genius of which was Ifis, the repuLAR

Large.

Large ted parent of the world. He observes farther, that special favour!), which serves to give an idea of the Larine they are described as dæmons and genii, who once lived on earth, and were gifted with immortality. Arnobius ftyles them Lares quosdam genios & functorum animas; and he fays, that according to Varro, they were the children of Mania. Huetius (Demonst. Prop. 4. p. 139.) adds, that Mania had also the name of Larunda: and she is styled the mother of the dæmons. By fome she is called Lara, and was supposed to prefide over families: and children were offered at her altar in order to procure her favour. In lieu of these they in after-times offered the heads of poppies and pods of garlic.

LARGE, a fea term applied to the wind when it croffes the line of a ship's course in a favourable direction, particularly on the beam or quarter. Thus, if a ship steer west, then the wind in any point of the compais to the eastward of the fouth or north may be called large, unless when it is directly east, and then it is faid to be right aft. Sailing large is, therefore, advancing with a large wind, so as that the sheets are flackened and flowing, and the bow-lines entirely difused. This phrase is generally opposed to failing closehauled.

LARGESS. See LARGITIO.

LARGITIO, in Roman antiquity, was a diffribution of corn, provision, cloaths, money, &c. to the people. Gracchus, when tribune, to make himfelf popular, paffed a law for fupplying the Roman citizens with corn at a very low rate, out of the public granaries. Claudius, another tribune, with the fame views to popular applause, procured it to be distributed gratis .- Cato, to win the common people from Cæfar, perfuaded the fenate to do the fame, and 300,000 citizens shared in the distribution. Cæfar, after his triumph, extended his bounty to 150,000, giving them each a mina. The Roman emperors enlarged fill further the lift of those who were to partake of their distributions. Largitio is frequently taken in a bad fenfe, to fignify a masked bribery; whereby candidates purchased votes, when they stood for places of honour or trust in the flate. The distribution of money was called congiarium, and the distributors divifores and fequestres.

LARGS, a village on the west coast of Scotland, opposite to the island of Bute; rendered memorable by the defeat of the Norwegians here in their last invasion of this country .- This invasion was made in the year 1263, with a fleet of 160 fail and an army of 20,000 men, commanded by Haquin king of Norway, whose ravages on the coast of Ayr, Bute, and Arran, reaching the Scottish court, an army was immediately affembled by Alexander III. and a bloody engagement enfued at this village, when 16,000 of the invaders were flain in the battle and flight, with 5000 Scots. Haquin escaped to the Orkneys, where he foon after died of grief. The entrenchments of the Norwegian camp may still be traced along the shore of this place. The Scottish commanders who fell in battle were buried in a rifing field, near the village; three or four perfons were interred in one grave, on each fide of which was a large stone, a third was placed across the grave, supported at the extremities by the fide stones, and in this rude manner the warriors lay entombed. these repositories of the dead, leaving only one (a gruca or caterpillar. See Transformation of INSECTS.

whole. LARINO, a town of Italy, in the kingdom of

Naples, in the Capitanata, with a bishop's fee. E. Long.

15.51. N. Lat. 41. 48.

LARISSA, an ancient, rich, and celebrated town of Greece, in the province of Janua or Theffaly, with an archbishop's see of the Greek church, a palace, and feveral handsome mosques. According to Virgil, it was the country of Achilles. It was also the place where Philip the father of Alexander the Great refided .- The inhabitants carry on a confiderable trade. The city is agreeably feated on the river Peneus, in E. Long. 23. 36. N. Lat. 38. 51.

LARIX, the LARCH-TREE. See PINUS.

LARK, in ornithology. See ALAUDA, and BIRD.

The lark is not only a very agreeable bird for the cage, but will live upon almost any food, fo that it have once a week a fresh tust of three-leaved grass. The proper method of keeping them in health is this: there must be two pans of food, the one containing meat, the other oatmeal and hempfeed. A very good food is the following: boil an egg very hard, to which add the crumb of a halfpenny loaf, and as much hempfeed; let the egg be chopped very fmall, and the hempfeed bruifed in the mortar; when these are mixed, the bread is to be crumbled in among the reft, and the whole to be rolled together with a common rolling-pin, and kept for use. There must be some fine fmall gravel strewed at the bottom of the cage, and renewed at farthest once in a week. This will prevent the bird's feet from getting hurt by being clogged with the dung; and his basking in this will keep him also from growing loufy, after which few come to good. There must be a perch in the cage, and it must either be lined with green bays, or made of fine matting, which the lark is very foud of. When the bird is first taken, some meat must be strewed upon the fand in the bottom of the cage; for it will be fometimes almost famished before it finds the meat in the pan.

The cock-bird of this kind is known from the hen by the loudness and length of his call, by his tallness as he walks about the cage, and by his doubling his notes in the evening, as if he was going with his mate to rooft. A better rule than all others, however, is his finging throng; for the hen wood-lark fings but very weakly .- Both the cock and hen of this kind are fubject to many diforders; the principal of these are cramps, giddiness of the head, and breeding lice. Cleanliness is the best cure for the first and the last of these complaints; but we know of no cure for the other. A good strong bird, however, will often last very well five or fix years, and improve all

the time. LARKSPUR. See DELPHINIUM.

LARRIBUNDAR, a fea-port town of Afia, in Indoftan ; feated at the mouth of the river Sinda, or Indus, with a harbour capable of receiving ships of 200 tons burden. It is but a fmall place, confifting of about 100 houses built with wood; but has a stone fort, with a sew guns. E. Long. 67. o. N. Lat. 25. o.

LARVA, in natural history, a name given by Lin-Some years ago the proprietor of the field demolished næus to infects in that state, called by other writers Larvæ Larus

LARVÆ, in antiquity, derived from the Hetruscan word lar or lars, fignifying "prince or lord," denoted the ghofts of the deceased, considered as wicked and mischievous. Hence is formed the term larvatus, i. e. larva indutus or demoniac. The ingenious Mr Farmer urges the etymology and use of this term to prove, that the heathen demons were human ghofts .- The larvæ were also called lemures.

LARVE, in mineralogy, the same with petrifactions.

See PETRIFACTIONS.

LARUS, the GULL, in ornithology; a genus be-Plates CCLXIV. longing to the order of anseres, the characters of &CCLXV. which are these: The bill is strait, cultrated, a little crooked at the point, and without teeth; the inferior mandible is gibbous below the apex; the noftrils are linear, a little broader before, and fituated in the middle of the beak. The different species are princi-

pally diffinguished by their colour.

1. The marinus, or black-backed gull, is in length 20 inches; in breadth five feet nine. The bill is very strong and thick, and almost four inches long; the colour a pale yellow; but the lower mandible is marked with a red fpot, with a black one in the middle. The head, neck, whole under-fide, tail, and lower-part of the back, are white: the upperpart of the back, and wings, are black; the quillfeathers tipt with white, the legs of a pale fleshcolour. It inhabits feveral parts of England, and breeds on the highest cliffs. The egg is blunt at each end; of a dusky olive-colour; quite black at the greater end, and the rest of it thinly marked with dusky spots. It is also common on most of the northern coasts of Europe. It frequents Greenland; but chiefly inhabits the distant rocks. It lays three eggs in May, placing them on the heaps of dung which the birds leave there from time to time. It is faid to attack other birds, and to be particularly an enemy to the eider duck. It very greedily devours carrion, though the most general food is fish. It is common also in America, as low as fouth Carolina, where it is called the old wife.

2. The cataractes, or Skua gull, is in length two feet; the extent four feet and a half; the weight three pounds: the bill is two inches one fourth long, very much hooked at the end, and very sharp; the upper mandible covered more than half-way with a black cere or fkin, as in the hawk kind; the noffrils are placed near the bend, and are pervious. The feathers on the head, neck, back, fcapulars, and coverts of the wings, are of a deep brown, marked with rutt-colour (brightest in the male). The breaft, belly, and vent, are ferruginous, tinged with ash-colour. The tail when fpread is circular, of a deep brown, white at the root. and with shafts of the same colour. The legs are covered with great black fealons: the talons black, strong, and crooked; the interior remarkably fo .-This bird inhabits Norway, the Ferroe ifles, Shetland, and the noted rock Foula a little west of them. It is also a native of the South Sea. It is the most formidable of the gulls; its prey being not only fish, but, what is wonderful in a web footed bird, all the leffer fort of water-fowl, fuch as teal, &c. Mr Schroter, a furgeon in the Ferroe isles, relates that it likewise preys on ducks, poultry, and even young lambs. It has all the frerceness of the eagle in defending its young; when

Vol. IX. Part II.

the inhabitants of those islands visit the nest, it at- Larus. tacks them with great force, fo that they hold a knife erect over their heads, on which the skua will transfix itself in its fall on the invaders. The Rev. Mr Low, minister of Birsa in Orkney, confirmed part of the above account : On approaching the quarters of these birds, they attacked him and his company with most violent blows; and intimidated a bold dog of Mr Low's in fuch a manner, as to drive him for protection to his mafter. The natives are often very rudely treated by them while they are attending their sheep on the hills; and are obliged to guard their heads by holding up their flicks, on which the birds often kill themselves. In Foula it is a privileged bird, because it defends the flocks from the eagle, which it beats and purfues with great fury; fo that even that rapacious bird feldom ventures near its quarters. The natives of Foula on this account lay a fine on any person who destroys one: they deny that it ever injures their flocks or poultry; but imagine it preys on the dung of the arctic and other larger gulls, which it perfecutes till they moot for fear .- These birds are alfo frequent in many high latitudes of the fouthern hemisphere; our circumnavigators met with them in Falkland ifles, particularly about Port Egmont, whence called Port Egmont hens. In this place, and at Terra del Fuego, they were observed to make their nells among the dry grass. After breeding-time, they difperfe over the ocean, and for the most part are feen in pairs. They are met with in Kerguelen's land, and off the Cape of Good Hope, and other parts. In all places its manners are the same in respect to serocity: it is frequently feen to attack the largest albatrofs, beating it with great violence fo long as it remains on the wing; at which time this cowardly giant finds no other refource than to fettle on the water; upon which the skua flies away.

3. The parafiticus, or dung-hunter, is in length 21 inches. The bill is an inch and a half long, pretty much hooked, and of a dufky colour : the noffrils are placed in a kind of cere: the top of the head is black; the fides of it, forehead, neck, and all beneath, white: across the breast there is a pale dusky bar: the upper parts of the body, wings, and tail, are black; the base of the quills white on the inner webs; and the two middle feathers of the tail are near four inches longer than the reft: the legs are scaly, not very flout; the colour of them is black. The female is faid to be entirely brown, paleft beneath; and the middle tail feathers only two inches longer than the others. This is a northern species; and very common in the Hebrides, where it breeds on heath. It comes in May, and retires in August; and if disturbed slies about like the lapwing, but foon alights. It is also found in the Orkneys; and on the coasts of Yorkshire, where it is called the feafer. It is met with likewife on the northern coafts of Sweden, Denmark, and Russia, as far as Kamtchatka; and it is common in Greenland, where it frequents the open sea, as well as the bays. The female makes an artless nest of grass and moss, on a hillock in some marshy place, and lays two ash-coloured eggs, spotted with black, the fize of those of a hen. This bird does not often fwim, and flies generally in a flow manner, except it be in pursuit of other birds : which it often attacks, in order to make them dif-

gorge

gorge the fifth or other food, which this common plunderer greedily catches up. Most authors have told us. that it is the dung of the birds which it fearches after in the pursuit; but latter observations inform us that the circumflance is not true; though, from the fuppofition of its being fo, the bird has obtained the name

of ftrunt-jager.

4. The fuscus, or herring-gull, weighs upwards of 30 ounces; the length 23 inches, its breadth 52: the bill is yellow, and the lower mandible marked with an orange coloured fpot : the back and coverts of the wings are aft-coloured; the upper part of the five first quill-feathers are black, marked with a white fpot near their end; the legs of a pale flesh colour. These birds breed on the ledges of tooks that hang over the fea: they make a large neft of dead grafs; and lay three eggs of a dirty white, spotted with black. The young are ash-coloured, spotted with brown. They do not come to their proper colour the first year: this is common to other gulls; which has greatly multiplied the species among authors, who are inattentive to these particulars. This gull is a great devourer of fish, especially of that from which it takes its name: it is a constant attendant on the nets, and so bold as to seize its prev before the fishermens faces .- The herring gull is common in this kingdom, and frequents the fame places as the black-backed. It is also found in most of the northern parts of Europe, as well as about the Cafpian and Black feas and the rivers which fall into them, and about the great lakes of Siberia. It is found likewife in Iceland, Greenland, and Hudion's Bay. In winter it migrates fouth, being found in Jamaica; and is faid to breed on fome of the islands on the coast of South Carolina.

5. The nævius, or wagel, is a large fpecies, being near two feet in length, and in breadth about five; weight, near three pounds. The bill is black; two inches and a half long: the irides are dufky: the whole plumage is composed of a mixed brown, ashcolour, and white; the middle of each feather brown: the under parts of the body are the fame, but paler: the quills are black: the lower part of the tail is mottled black and white; near the end is a bar of black, and beyond this the end is white : the legs are of a dirty flesh-colour, in some white .- This species frequents the fea-shores of many parts of England, though not in any confiderable numbers. At times it is feen on the banks of the Thames along with other gulls; and is there supposed to be the female of the black-backed: but this has not yet been determined

fufficiently by authors.

6. The hybernus, or winter-gull, winter-mew, or coddy moddy, weighs from 14 to 17 ounces: the length 18 inches, the breadth three feet nine. The irides are hazel: the bill is two inches long, but the flenderest of any gull; black at the tip, and whitish towards the base. The crown of the head, and hindpart and fides of the neck, are white, marked with oblong dufky fpots; the forehead, throat, middle of the breaft, belly, and rump, white; the back and fcapulars of a pale grey, the last spotted with brown: the coverts of the wings are of a pale brown, edged with white; the first quill-feather is black, the succeeding ones are tipt with white; the tail is white, croffed near the and for a long time together: they are often observed

end with a black bar; the legs are of a dirty bluish Larus. white. This kind frequents, during winter, the moist meadows in the inland parts of England, remote from the fea. The gelatinous fubftance, known by the name of flar-shot, or star-gelly, owes its origin to this bird, or fome of the kind; being nothing but the half digefied remains of earth-worms, which thefe birds feed on, and often discharge from their stomachs.

7. The canus, or common gull, is in length 16 or 17 inches; in breadth 36; weight one pound. The bill is yellow: the irides are hazel, and the eye-lids brown: the head, neck, under parts of the body, and tail, are white; the back and wings, pale grey: the outer edge of the four first quills, and tips of the first five, are black; but the fourth and fifth have a white fpot at the tips; the reft, except the three nearest the body, have the ends white: the legs are of a dull greenish white. This feems to be the most common of all the gulls, being found in vaft numbers on our shores and rivers which are contiguous to the fea. It is feen also very far north, as far as Iceland and the Ruffian lakes: it is met with in the neighbourhood of the Caspian Sea, in various shores of the Mediterranean, and as far fouth as Greece: and it is found also in America, on the coast of Newfoundland. It breeds on the rocks and cliffs, like others of the genus; and the eggs are two inches and a half in length, of a deep olive brown, marked with irregular deep reddish blotch-It is a tame species, and may be seen by hundreds on the shores of the Thames and other rivers, in the winter and fpring, at low tides, picking up the various worms and small fish left by the tides; and will often follow the plough in the fields contiguous, for the fake of worms and infects which are turned up, particularly the cockchafer or dorbeetle in its larvæ flate, which it joins with the rooks in devouring most greedily.

8. The tridactylus, or tarrock, is in length 14 inches, breadth 36; weight feven ounces. The bill is short, thick, and black: the head, neck, and under parts, are white: near each ear, and under the throat, there is a black fpot; and at the hind part of the neck a crefcent of black: the back and feapulars are bluish grey; the wingcoverts dusky edged with grey, some of the larger wholly grey: the exterior fides and ends of the first four quills. are black, tips of the two next black, all the reft white; the ten middle feathers of the tail are white tipped with black, the two outermost wholly white: the legs are of a dusky ash-colour; in lieu of the back toe, it has only a protuberance. This breeds in Scotland with the kittiwake; and inhabits other parts of northern Europe, quite to Iceland and Spitzbergen, the Baltic and White Sea, as also Kamtchatka. It is common in Greenland in fummer. It comes in fpring, and frequents the fea-shores; builds in the rocky crags of the bays; in June lays two eggs of a greenish ash-colour fpotted with brown; and retires from the shores in autumn. It is observed frequently to attend the whales. and feals, for the fake of the fish which the last drive before them into the shallows, when these birds dart into the water fuddenly and make them their prey. They are very noify birds, especially during the time of incubation. They fwim well, and fly equally well, Tarns, on portions of ice swimming in the sea. Both the flesh noblemens tables. The note of these gulls is like a Larynx and eggs are effeemed by the Greenlanders, and the hoarfe laugh. fkins used as garments.

o. The riffa, or kittiwake, is in length 14 inches, in extent three feet two. When arrived at full age, the head, neck, belly, and tail, are of a fnowy whiteness; behind each ear is fometimes a dufky fpot : the back and wings are grey: the exterior edge of the first quillfeather, and tips of the four or five next, are black : the bill is vellow, tinged with green; and the infide

of the mouth is orange; the legs are dufky, with only a knob inflead of the back-toe. It inhabits the romantic cliffs of Flamborough-head (where it is called petrel), the Bass isle, the vast rocks near the castle of Slains in the county of Aberdeen, and Prieftholm ifle. The young of these birds are a favourite dish in North Britain, being ferved up roafted, a little before dinner, in order to provoke the appetite; but from their rank tafte and fmell, feem much more likely to produce a contrary effect. This bird is likewife met with at Newfoundland; in Greenland, Spitzbergen, Iceland, and the north of Europe; the arctic coast of Asia; and Kamtchatka. By the Icelanders it is called eitfa. Some authors affirm the kittiwake to be the

tarrock in a flate of perfection; while others maintain the contrary.

10. The ridibundus, pewit, or black-head gull, is in length 15 inches, breadth three feet; weight 10 ounces. The bill is rather flender, and of a blood-red: the eve-lids are red, and the irides hazel: the head and throat are dusky brown, in old birds black; and on each eve-lid is a fmall white fpot: the back and wings are of an ash-colour: the neck, all the under parts, and tail, are white; the ten first quills are white, margined and more or less tipped with black; the others of an ash-colour, with white ends: the legs are of the colour of the bill, the claws black. This species breeds on the shores of some of our rivers; but full as often in the inland fens of Lincolnshire, Cambridgethire, and other parts of England. They make their neft on the ground, with rushes, dead grafs, and such like; and lay three eggs of a greenish brown marked with red brown blotches. After the breeding feafon, they again disperse to the sea-coasts. They breed also in Northumberland and Scotland; and are found throughout Ruffia and Siberia, as far as Kamtchatka, but not farther to the north. They are feen throughout the winter at Aleppo, in great numbers; and fo tame, that the women are faid to call them from the terraces of their houses, throwing up pieces of bread, which thefe birds catch in the air. They inhabit North America, coming into New England in May and departing in August. The young birds in the neighbourhood of the Thames are thought good eating, and are called the red-legs. They were formerly more efteemed, and numbers were annually taken and fattened for the table. Plott gives a marvellous account of their attachment to the lord of the foil they to shift their quarters for a certain time. Whitelock, in his Annals, mentions a piece of ground near Portsmouth, which produced to the owner 40 l. a-year by the fale of pewits, or this species of gull. These are the fee gulles that in old times were admitted to the

11. The atricilla, or laughing gull, is in length 18 inches, breadth three feet. It differs from that bird only in the legs, which are black inftead of red.' It is found in Ruffia on the river Don, particularly about Tichercask. The note resembles a coarse laugh, whence the name of the bird. Is met with also in different

parts of the continent of America: and is very numetous in the Bahama islands. There are 9 or 10 other species of this genus.

LARYNX, in anatomy, the upper part of the wind-pipe. See ANATOMY, no 116.

LASCARIS (Andrew John), furnamed Ryndacenus. of an ancient Greck family, went into Italy, after the taking of Constantinople by the Turks in 1453. He guifhed protector of learned men; and was twice fent to Constantinople to collect the best Greek manuscripts, by which means numberless scarce and valuable treafures of literature were carried into Italy. At his refettle in the university of Paris, and fent him twice ambaffador to Venice. Ten years after, cardinal John de Medicis being elected pope, under the name of Leo X. John Lascaris, his old friend, went to Rome, and had the direction of a Greek college. He died at Rome in 1535, at about the 90th year of his age. He brought into the West most of the fine Greek manufcripts that are now extant, and composed some epigrams in Greek and Latin.

LASCARIS (Constantine), one of the Greeks who were principally concerned in the revival of learning in the West, retired into Italy in 1454, and taught polite literature at Milan, whither he was called by Francis Sforza; he afterwards went to Rome, where he was well received by Cardinal Beffarion. He afterwards taught rhetoric and the Greek tongue at Naples; and ended his days at Messina, leaving the fenate of that city many excellent manufcripts which he had brought from Constantinople. He was interred at the public expence, and the fenate of Meffina erected a marble tomb to his memory. He wrote

fome grammatical works.

LASERPITIUM, LAZAR-WORT: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 45th order, Umbellate. The fruit is oblong, with eight membranaceons angles; the petals inflexed, emarginated, and patent. There are nine species, none of which are at all remarkable for their beauty, so are only preferved in botanic gardens for the fake of variety. They are natives of Germany, Italy, and the fouth of France. All of them abound with an acrid juice, which turns to an exceffively acrimonious refin. This was used by the ancients to take away black and blue fpots that came by bruifes or blows, as also to take away excrefcences: it was also by some of the ancients used internally; but produced such violent effects, that the more prudent refrained from the use of it. It is generally supposed that the filphium of the ancients was procured from one of the species of this genus; but of this we are at prefent ignorant.

LASH, or LACE, in the fea-language, fignifies to 4 D 2

Latere.

Lassitude bind and make fail; as, to lash the bonnet to the courfe, or the drabbler to the bonnets; also the carpenter takes care that the spare yards be lashed fast to the flip's fide; and in a rolling fea, the gunners mind that the guns be well lashed, lest they should break loofe. Lashers are properly those ropes which bind fast the tackles and the breechings of the ordnance, when hauled or made fast within board.

LASSITUDE, or WEARINESS, in medicine, a morbid fenfation, that comes on fpontaneously, without any previous motion, exercife, or labour. frequent symptom in acute diftempers: it arifes either from an increase of bulk, a diminution of proper evacuation, or too great a confumption of the fluids neceffary to maintain the spring of the folids, or from a

vitiated fecretion of that juice.

LASSUS, or Lasus, a dithyrambic poet, born at Hermione in Peloponnesus about 500 years before Christ. He is reckoned among the wife men of Greece by fome. He is particularly known by the answer he gave to a man who asked him what could best render life pleafant and comfortable? Experience. He was acquainted with mufic. Some fragments of his poetry are to be found in Atheneus. He wrote an ode upon the Centaurs, and an hymn to Ceres, without inferting the letter S in the composition.

LAST, in general, fignifies the burden or load of a ship. It signifies also a certain measure of fish, corn. wool, leather, &c. A last of codfish, white herrings, meal, and ashes for foap, is twelve barrels; of corn or rapefeed, ten quarters; of gunpowder, twenty-four barrels; of red herrings, twenty cades; of hides, twelve dozen; of leather, twenty dickers; of pitch and tar, fourteen barrels; of wool, twelve facks; of flock-fifth,

one thousand; of flax or feathers, 1700lb.

LASTAGE, or LESTAGE, a duty exacted in some fairs and markets, for carrying things bought whither one will. It fignifies also the ballast or lading of a fhip; and fometimes is used for garbage, rubbish, or fuch like filth.

LATERAN was originally the proper name of a man: whence it descended to an ancient palace in Rome, and to the buildings fince erected in its place; particularly a church called St John of Lateran, which

is the principal fee of the popedom.

Councils of the LATERAN, are those held in the basilica of the Lateran: of these there have been five, held in 1123, 1139, 1179, 1215, and 1513.

Ganons Regular of the Congregation of the LATERAN, is a congregation of regular canons, whereof that

church is the principal place or feat.

It is pretended there has been an uninterrupted fuccession of clerks, living in community from the time of the apofiles : and that a number of these were established in the Lateran in the time of Constantine. But the canons were not introduced till the time of Leo I. and these held the church 800 years, till the reign of Boniface, who took it from them, and placed fecular canons in their room: 150 years after, the regulars were reinstated

A LATERE, a term used to denote the qualifications of the cardinals whom the pope fends as legates into foreign countries. They are called legates a latere, as being his holinefs's affiltants and counfellors in ordinary. These are the most considerable of the

otherthree kinds of legates, being fuch as the pope com- Latere missions to take his place in councils; and so called, in regard that he never gives this office to any but his favourites and confidants, who are always a latere, at his fide. A legate a latere has the power of couferring benefices without a mandate, of legitimating bastards to hold offices, and has a cross carried before him as the enfign of his authority.

De LATERE, legates who are not cardinals, but yet are entrusted with an apostolical legation. See the

article LEGATE.

LATE-WAKE, a ceremony used at funerals in the Highlands of Scotland. The evening after the death of any person, the relations and friends of the deceased meet at the house, attended by bagpipe or fiddle ; the nearest of kin, be it wife, son, or daughter, opens a melancholy ball, dancing, and greeting (i. e. crying violently) at the same time, and this continues till daylight; but with fuch gambols and frolics among the younger part of the company, that the lofs which occasioned them is often more than supplied by the confequences of that night. If the corple remains unburied for two nights, the fame rites are renewed. Thus, Scythian like, they rejoice at the deliverance of their friends out of this life of mifery.

LATEEN sail, a long triangular fail extended by a lateen yard, and frequently used by xebecs, poleacres, fetees, and other veffels navigated in the Mediterra-

nean fea.

LATH, in building, a long, thin, and narrow flip of wood nailed to the rafters of a roof or cieling, in

order to fustain the covering,

LATH-Bricks, a particular fort of bricks made in fome parts of England, of 22 inches in length and 6 in breadth, which are used in the place of laths or foars, supported by pillars in casts, for the drying of malt. This is an excellent contrivance; for belides that they are not liable to fire, as the wooden laths are, they retain the heat vally better; fo that being once heated, a very finall quantity of fire will ferve to keep them fo.

LATHE, a very useful engine for the turning of wood, ivory, metals, and other materials. (See TURN-ING.) The invention of the lathe is very ancient: Diodorus Siculus fays, the first who used it was a: grandfon of Dædalus, named Talus. Pliny afcribes it to Theodore of Samos; and mentions one Thericles, who rendered himfelf very famous by his dexterity in managing the lathe. With this instrument the ancients turned all kinds of vales, many whereof they enriched with figures and ornaments in baffo relievo. Thus Virgil:

Lenta quibus torno facili superaddita vitis.

The Greek and Latin authors make frequent mention of the lathe; and Cicero calls the workmen who used it vafcularii. It was a proverb among the ancients, to fay a thing was formed in the lathe, to express its de-

licacy and justness.

The lathe is composed of two wooden cheeks or fides, parallel to the horizon, having a groove or opening between; perpendicular to these are two other pieces called puppets, made to flide between the cheeks, and to be fixed down at any point at pleafure. These have two points, between which the piece to be turned is fustained; the piece is turned round,

backwards.

Lathræa backwards and forwards, by means of a ftring put round it, and fastened above to the end of a pliable Latiar. pole, and underneath to a tredle or board moved with the foot. There is also a rest which bears up the tool, and keeps it fleady.

As it is the use and application of this inftrument that makes the greatest part of the art of turning, we refer the particular description thereof, as well as the manner of applying it in various works, to that head.

See TURNING

LATHRÆA, in botany : A genus of the angiofpermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 40th order, Personata. The calvx is quadrifid ; there is a depressed glandule at the base of the suture of the

germen: The capfule is unilocular.

LATHREVE, Leidgreve, or Trithengreve, was an officer under the Saxon government, who had authority over a third part of the county; and whose territory was therefore called trithing, otherwise a leid or leithin, in which manner the county of Kent is still divided; and the rapes in Suffex feem to answer to the fame. As to the jurisdiction of this officer, those matters that could not be determined in the hundred court, were thence brought to the trithing; where all the principal men of the three or more hundreds being affembled by the lathreve, or trithingreve, did debate and decide it; or if they could not, then the lathreve fent it up to the county court, to be there finally determined.

LATHYRUS, CHICKLING: A genus of the decandria order, belonging to the diadelphia class of plants; and in the natural method ranking under the 32d order, Papilionacea. The ftylus is plain, villous above, towards the end broader; the upper two feg-

ments of the calyx are shorter than the relt.

Species, 1. The latifolius, or everlatting pea, hath thick, fibrous, perennial roots; climbing, thick, branching annual stalks, having membranaceous wings between the joints, rifing upon support by their cirri fix or eight feet high; diphyllons leaves, of two fpearfhaned lobes, terminated by claspers; and numerous large red or purple flowers on long foot stalks, appearing plentifully from June till October, foeceeded by abundance of feed. 2. The odorata, or fweet-fcented pea, hath a fibrous annual root; a climbing flalk, rifing upon support by its claspers three or four feet high; diphyllous leaves of two oval lobes, terminated by climbing tendrils; and flowers by two's on long flower stalks, of different colours in the varieties. 3. The tangitanus, or Tangier-pea, hath a fibrous annual root, a climbing stalk rising upon support for four or five feet high; diphyllous leaves, of two fpearshaped alternate lobes, terminated by tendrils; and from the joints of the stalk large reddish slowers by two's on long footilalks.

Culture. All these species are of hardy growth; and may be propagated by feed in the common ground, in patches where it is defigned the plants should flower, for they do not fucceed fo well by transplantation. They may be fowed in fpring; though, if fowed in antumn, the plants will flower earlier the following

LATIAR, in Roman antiquity, a feath or ceremony inflituted by Tarquinius Superbus, in honour of Jupiter Latiaris or Latialis. - Tarquin Laticlave, having made a treaty of alliance with the Latins, Latimer. proposed, in order for perpetuating it, to erect a common temple, where all the allies, the Romans, Latins, Hernici, Volfei, &c. should affemble themfelves every year, hold a kind of fair, exchange merchandizes, feaft, facrifice, and make merry together. Such was the institution of the Latiar. The founder only appointed one day for this feaft : the first conful added another to it, upon concluding the peace with the Latins; and a third was added after the people who had retired to the Mons Sacer were returned to Rome; and a fourth, after appealing the fedition raifed on occasion of the plebeians aspiring to the confu-

These four days were called the Latin feria; and all things done during the course of the feriæ, as feasts, facrifices, offerings, &c. were called Latiares.

LATICLAVE, (Laticlavium), in Roman antiquity, was an honourable distinction, peculiar, in the times of the republic, to the fenators; but whether it was a particular kind of garment, or only an ornament upon it, the critics are not agreed : But the more general opinion is, that it was a broad stripe of purple fewed upon the fore-part of their tunic, and round the middle of the breaft. There were buttons fet on the latus clavus or laticlave, which appeared like the heads of large nails, whence fome think it derived its name. -The fenators, prætors, and chief magistrates of colonies and municipal cities, had a right to wear it. The prætexta was always worn over it; but when the prætor pronounced fentence of death, the prætexta was then put off, and the laticlave retained. The laticlavium differed from the anguficlavium, but authors do not agree in what respect this difference consisted; the most general opinion feems to be, that the flips or itripes of purple were narrower in the anguiticlave. LATIMER (Hugh), bishop of Worcester, was

born about the year 1480 at Thurcaston in Leicestershire, the only fon of a yeoman of that village. At the age of fourteen he was fent to Christ's college, Cambridge; where he applied himself to the study of divinity, and in proper time took the degree of bachelor in that science. At this time he was a zealous Papitt, and was honoured with the office of keeper of the crofs to the university : but when he was about thirty years of age, he became a convert to the Protestant religion; and being now one of the twelve licenfed preachers from Cambridge, he promulgated his opinions with great freedom. It was not long before he was accused of herefy; and being summoned before cardinal Wolfey, was obliged to fubfcribe certain articles of faith, which he certainly did not believe. About the year 1529 he was prefented by the king to the rectory of Weitkinton in Wiltihire; to which place, after refiding fome time at court with his friend and patron Dr Butts, he retired; but, refuming his former invectives against the Popish doctrines, he was again fummoned to answer certain interrogatories, and again obliged to subscribe. In 1535 he was promoted to the bishopric of Worcester; in the possession of which dignity he continued till the year 1539, when, rather than affent to the act of the fix articles, he re-

figned his mitre, and retired into the country; but

was in a short time accused of speaking against the fix

articles.

tinued prisoner till the death of Henry VIII. which happened in January 1547. On the accession of Edward VI. Latimer was released, but not restored to his bishopric, though he preached several times before the king, and continued to exercise his ministerial function with unremitting zeal and resolution. Young Edward, alas! finished his short reign in 1553; and Mary, of infamous memory, afcending the throne, poor Latimer was immediately doomed to destruction, and, together with Cranmer and Ridley, confined in the Tower. In April 1554, they were removed to Oxford, that they might dispute with the learned doctors of both univertities. Latimer declining the disputation on account of his great age and infirmities, delivered his opinion in writing; and refufing to subscribe the Popish creed, was condemned for herefy; and in October following was, together with bishop Ridley, burnt alive. He behaved with uncommon fortitude on the occasion, and died a real martyr to the Reformation. His general character is that of a learned, virtuous, and brave man. His works are, 1. Sermons, 1635, fol. 2. Letters; in Fox's Acts and Monum. vol. ii. fol. 1580. 3. An injunction to the prior and convent of St Mary's in Worcestershire. See record at the end of Burnet's History of the Reformation, part ii. p. 293.

LATIN, a dead language, first spoken in Latium, and afterwards at Rome; and ftill used in the Romish

church, and among many of the learned. This language is principally derived from the Greek,

and particularly from the Eolic dialect of that tongue, though it has a great number of words which it borrowed from the languages of the Etrusci, Osci, and other ancient people of Italy; and foreign commerce. and wars, in course of time, added a great many more.

The Latin is a strong nervous language, perfectly fuitable to the character of the people who spoke it: we have fill works of every kind admirably well written in the Latin, though there are vast numbers loft.

The Latin tongue was for a while confined almost wholly within the walls of Rome; nor would the Romans allow the common use of it to their neighbours. or to the nations they subdued : but by degrees they in time became fenfible of the necessity of its being generally understood for the conveniency of commerce; and accordingly used their endeavours, that all the nations subject to their empire should be united by one common language; fo that at length they imposed the use of it by a particular law for that purpose. After the translation of the feat of the empire from Rome to Conftantinople, the emperors of the east, being always defirous of retaining the title of Roman emperors, appointed the Latin to be still used; but at length neglecting the empire of the west, they abandoned all care of the Latin tongue, and used the Greek. Charlemagne coming to the empire of the west, revived this language; but at length it gave way, and the French took place of the Latin: it was, however, prodigioufly degenerated before it came to be laid afide, in which condition it was found at the time of the Reformation, when Vives, Erasmus, &c. began to open the way for its recovery: fince which time the monkish latinity has

Latiner, articles, and committed to the Tower, where he con- been declining, and all endeavours have been used to Latins retrieve the pure language of the Augustan age. See Latomia. LANGUAGE.

LATIN-Church. See CHURCH.

LATINS, an ancient nation of Italy, See La-

LATINUS, king of the Latins in Italy, was the fon of Faunus; and, it is faid, began to reign about the 1216th year before the Christian era. Lavinia. his only daughter, married Æneas, after that Trojan prince had killed Turnus king of the Rutuli. See

LATISSIMUS, in anatomy, the name of feveral muscles. See ANATOMY, Table of the Muscles.

LATITUDE, in attronomy, is the distance of a flar north orl fouth from the ecliptic. In geography it fignifies the diffance of any place north or fouth, from the equator. See ASTRONOMY and GEOGRAрну, райт.

LATITUDINARIAN, a person of moderation with regard to religious opinions, who believes there is a latitude in the road to heaven, which may admit

people of different perfuafions.

LATIUM (anc. geog.), the country of the Latins, at first contained within very narrow bounds, but afterwards increased by the accession of various people. The appellation, according to Virgil, is a latendo, from Saturn's lying hid there from the hoftile pursuits of his fon Jupiter; and from Latium comes the name Latini, the people, (Virgil): though Dionysius Halicarnaffæus derives it from king Latinus, who reigned about the time of the Trojan war. But whatever be in this, it is certain, that Latium, when under Æneas and his descendents, or the Alban kings, contained only the Latins, exclusive of the Æqui, Volsei, Hernici, and other people; only that Æneas reckoned the Rutuli, after their conquest, among the Latins. And this constituted the ancient Latium, confined to the Latins: but afterwards, under the kings, and after their time, it reached from the Tiber to Circeii. Under the confuls, the country of the Equi, Volsci, Hernici, &c. after long and bloody wars, was added to Latium, under the appellation adjectitious or superadded Latium, as far as the river Liris, the eastern boundary, and to the north as far as the Marsi and Sabines. The various people, which in fuccession occupied Latium, were the Aborigines, the Pelafgi, the Arcades, the Siculi, the Arunci, the Rutuli; and beyond Circeii, the Volfci, the Ofci, the Aufones: but who first, who next, occupied the country, it is difficult to fav.

LATMUS (anc. geog.), a mountain of Ionia, or on the confines of Caria, famous for the fable of Endymion, of whom the Moon was faid to be enamoured: hence called Latmius Heros, and Latmius Venator. In the mountain was a cave in which Endymion dwelt (Scholiast on Apollonius Rhodius). Supposed by Hecatzus to be the Phtheiron Mons of Homer; but by others to be Grius Mons, nor far from Latmus

LATOMIA, properly fignifies a flone quarry: But the places whence stones had been dug having been made use of fometimes as dungeons, jails, or prifons for criminals, it is oftentimes applied as a name

Latona for a prison. There was a place of confinement of were public places where the slaves washed and emp. Latrunculi, Syracufe, in which Cicero fays Verres had shut up Roman citizens.

LATONA, in mythology, a pagan goddess, whose history is very obscure. Hesiod makes her the daughter of Titan Coeus and Phoebe his fifter. She was admired for her beauty, and celebrated for the favours which the granted to Jupiter. Juno, always jealous of her huf-band's amours, made Latona the object of her vengeance, and fent the ferpent Pythou to disturb her peace and perfecute her. Latona wandered from place to place in the time of her pregnancy, continually alarmed for fear of Python. She was driven from heaven; and Terra, influenced by Juno, refufed to give her a place where the might reft and bring forth. Neptune, moved with compassion, struck with his trident and made immoveable the island of Delos, which before wandered in the Ægean, and appeared fometimes above, and fometimes below, the furface of the fea. Latona, changed into a quail by Jupiter, came to Delos; where the refumed her original thape, and gave birth to Apollo and Diana, leaning against a palm tree or an olive. Her repose was of short duration: Juno discovered the place of her retreat, and obliged her to fly from Delos. She wandered over the greatest part of the world; and in Caria, where her fatigue compelled her to stop, she was insulted and ridiculed by the peafants of whom the asked for water while they were weeding a marsh. Their refusal and infolence provoked her, and she intreated Jupiter to punish their barbarity. They were all changed into frogs. She was also insulted by Niobe; who boasted herself greater than the mother of Apollo and Diana, and ridiculed the prefents which the piety of her neighbours had offered to Latona. At last, Latona, though perfecuted and exposed to the refentment of Juno, became a powerful deity, and faw her children receive divine honours. Her worship was generally established where her children received adoration; particularly at Argos, Delos, &c. where she had temples. She had an oracle in Egypt, celebrated for the true and decifive answers which it gave. Latona, Venus, and Diana, were the three goddesses most in veneration among the Roman women.

LATRIA, in theology, a religious worship due only to God. See ADDRATION.

The Romanists fay, "They honour God with the worship of latria, and the faints with the worship of But the terms, however diffinct, are usually

The worthip of latria, befides its inner characters, has its external marks to diftinguish it; the principal whereof is facrifice, which cannot be offered to any other but God himself, as being a solemn acknowledgment or recognition of the fovereignty of God, and our dependence on him.

Mr Daille feems to own, that fome of the fathers of the fourth century allowed the diffinction between

LATRINÆ, were public houses of office, or necesfaries, amongst the Romans. We do not find, in the writings or buildings that remain of antiquity, that

this fort at Rome, near the Tullianum; another at tied their maîter's close-stools. We are pretty well affured that the Romans had public places of convenience, which were covered over, and had a fpongé hanging up in them for cleanliness. Rich men had close stools, which were taken away occasionally to the common fhores.

LATRUNCULI, a game amongst the Romans, of much the fame nature with our chefs. 'The latrunculi were properly the chefs men, called also latrones and calculi. They were made of glass, and diftinguished by black and white colours. Sometimes they were made of wax or other convenient fubstances. Some give the invention of this game to Palamodes when at the fiege of Troy; Seneca attributes it to Chilon, one of the feven Grecian fages; others honour Pyrrhus with the invention; and others again contend that it is of Persian origin-but is not this Lis de lana caprina? Frequent allusions to this game are met with in the Roman claffics, and a little poem was wrote upon it addressed to Pifo, which some fav was the work of Ovid, others of Lucau, in the end of fome editions of whose works it is to be found, and to which we refer for a fuller account of the game. This game expresses fo well the chance and order of war, that it is, with great appearance of probability, attributed to fome military officer as the inventor. One Canius Julius was fo exceedingly fond of chefs, that after he was fentenced to death by Caligula, he was found playing, but interrupted in his game by a call to execution; he obeyed the fummons, but first defired the centurion who brought the fatal order, to bear witness that he had one man upon the board more than his antagonist. that he might not falfely brag of victory when he fhould be no more.

LATTEN denotes iron-plates turned over, of which

tea-cannifters are made.

Plates of iron being prepared of a proper thinnels, are smoothed by rulling them in an acid liquor, as common water made eager with rye. With this liquor they fill certain troughs, and then put in the plates, which they turn once or twice a-day, that they may be equally rusted over. After this they are taken out, and well icoured with fand; and, to prevent their rufting again, are immediately plunged into pure water. in which they are to be left till the instant they are to be tinned or blanched; the manner of doing which is this: They flux the tin in a large iron crucible, which has the figure of an oblong pyramid with four faces, of which two opposite ones are less than the two others. The crucible is heated only from below, its upper part being luted with the furnace all round. The crucible is always deeper than the plates which are to be tinned are long; they always put them in downright, and the tin ought to fwim over them; to this purpose artificers of different trades prepare plates of different shapes, though Mr Reaumur thinks them all exceptionable. But the Germans use no fort of preparation of the iron to make it receive the tin more than the keeping it always steeped in water till the time; only when the tin is melted in the crucible, they cover it with a layer of a fort of fuet, which is usually two inches thick, and the plate must pass through this bethey had any privies in their dwellings. The latring fore it can come to the melted tim. The first use Lava.

for if any part should take fire, the fuet would foon moisten it, and reduce it to its primitive state again. The blanchers fay, this fuet is a compounded matter. It is indeed of a black colour: but Mr Reaumur fupposed that to be only an artifice to make it a secret, and that it is only coloured with foot or the smoke of a chimney : but he found it true fo far, that the common unprepared fuet was not fufficient; for after feveral attempts, there was always fomething wanting to render the success of the operation certain. The whole fecret of blanching, therefore, was found to lie in the preparation of this fuet; and this at length he discovered to confist only in the first frying and burning it. This fimple operation not only gives it the colour, but puts it into a condition to give the iron a disposition to be tinned, which it does surprisingly.

The melted tin must also have a certain degree of heat : for if it is not hot enough, it will not flick to the iron; and if it is too hot, it will cover it with too thin a coat, and the plates will have feveral colours, as red, blue, and purple, and upon the whole will have a cast of yellow. To prevent this, by knowing when the fire has a proper degree of heat, they might try with fmall pieces of iron; but in general, use teaches them to know the degree, and they put in the iron when the tin is at a different standard of heat, according as they would give it a thicker or thinner coat. Sometimes also they give the plates a double layer, as they would have them very thickly covered. This they do by dipping them into the tin when very hot the first time, and when less hot the second. The tin which is to give the fecond coat must be fresh covered with fuet; and that with the common fuet, not the prepared.

LATTEN-Brass, plates of milled brass reduced to different thickness, according to the uses they are in-

tended for.

LATTIMO, in the glass-trade, a name for a fine milk-white glass. There are feveral ways of making it, but the best of all is this: take 400 weight of crystal frit, and 60 pounds of calcined tin, and two pounds and a half of prepared manganese; mix these well with the frit, and fet them in a pot in a furnace to melt and refine. At the end of 18 hours this will be purified; then cast it into water, purify it again afterwards in the furnace, and make a proof of it. If it be too clear, add 15 pounds more of calcined tin; mix it well with the metal, and let it ftand one day to purify; it will then be of a whiteness surpassing even that of fnow, and is fit to work into vessels.

LAVA, a stream of melted minerals which runs out of the mouths, or burfts out through the fides of burning mountains during the time of an eruption. See ÆTNA, VESUVIUS, HECLA, VOLCANO, &c.

The lava at its first discharge is in a state of prodigious ignition, greatly superior to any thing we can have an idea of from the small artificial furnaces made by us. Sir William Hamilton informs us, that the lava of Vesuvius, at the place whence it issued (in the year 1767), " had the appearance of a river of red-hot and liquid metal, such as we see in the glasshouses, on which were large floating cinders half lighted, and rolling over one another with great precipitation down the fide of the mountain, forming on

Latten of this covering is to keep the tin from burning; the whole a most beautiful and uncommon cascade." Lava-Now, if we consider the materials of which the lava confifts, which undoubtedly are the common matters to be found every where in the earth, namely, stones, metallic ores, clay, fand, &c. we shall find that our hottest furnaces would by no means be able to bring them into any degree of fusion; since the materials for glass cannot be melted without a great quantity of very fufible falts, fuch as alkalies, nitre, &c. mixed along with them. The heat of a volcano must therefore be immense: and besides its heat, it is sometimes attended with a very uncommon circumstance; for Sir William Hamilton informs us, that " the red-hot ftones thrown up by Vesuvius on the 31st of March Excessive 1766 were perfectly transparent;" and the like re-lavas, mark he makes on the vait stream of lava which issued from this volcano in 1779: (See VESUVIUS). This we cannot look upon to be the mere effect of heat: for mere heat with us will not make a folid body tranfparent; and these stones, we are fure, were not in a state of fusion, or the refistance of the air would have broke them all to pieces, even fuppoling them, which is very improbable, to have been in that flate detached from the rest of the lava. For the transparency, therefore, we mult have recourse to electricity; which in some of our experiments hath the property of rendering opaque bodies transparent *. Indeed it is scarce possible but * See Electhe lava and every other matter thrown out of a vol-tricity, Incano must be in the highest degree electrical, seeing dexi the fire itself most probably takes its rife from electri- Probably

The lava, after having once broke out, does not electrified nflantly continue running from the city, as is shown under the article VOLCANO. conftantly continue running from the same vent, but fate alfo. often has intermissions, after which it will burst out fometimes at the same place, and sometimes at another. No real flame ever appears to come from the lava. Their gene-In the day-time its progress is marked by a thick ral appearwhite smoke, from which the light of the red hot mat-ance.

ter being reflected in the night-time, makes it appear like flame. But if, during its progress, it meets with trees or other combustible substances, which it frequently does, a bright flame immediately iffues from its furface, as hath also been remarked by Sir William Hamilton .- This liquid fubstance, after having run pure for about 100 yards (more or lefs, no doubt, according to different circumstances), begins to collect cinders, stones, and a scum is formed on the surface. Our author informs us, that the lava which he observed, with its fcum, had the appearance of the river Thames, as he had feen it after a hard frost and a great fall of fnow, when beginning to thaw, carrying down vast masses of snow and ice. In some places it totally disappeared, and ran in a subterraneous passage formed by the fcum for feveral paces; after which it came out pure, having left the fcum behind, though a new one was quickly formed. This lava at the fartheft extremity from its fource did not appear liquid. but like a heap of red-hot coals, forming a wall in fome places 10 or 12 feet high, which rolling from the top foon formed another wall, and fo on .- This was the appearance also put on by the lava which issued in the great eruption of 1783 in Iceland; with this difference, that the wall was at one time 210 feet high, and the general thickness of it was more than 100: (See HECLA). While a lava is in this state, Sir Wil-

CCS.

Lava, liam is of opinion, that it is very practicable to divert it into another channel, in a manner somewhat fimilar to what is practifed with rivers. This he was afterwards told had been done with fuccess during the great eruption of Etna in 1669; that the lava was directing its course towards the walls of Catania, and advancing very flowly, when they prepared a channel for it round the walls of the town, and turned it into the fea. A fuccession of men, covered with sheep skins wetted, were employed to cut through the tough flanks of lava, till they made a paffage for that in the centre, which was in perfect fution, to difgorge itself into the channel prepared for it. But this, it is evident, can only take place in fmall ftreams of this burning matter; with that above mentioned it would have been impof-Do not al. fible. It hath been also observed of the lavas of Etfeend to the eft places, but will fometimes afcend in fuch a manner lowest pla-

na, that they do not constantly fall down to the lowas to make the valleys rife into hills. On this Sir William Hamilton has the following note: " Having heard the fame remark with regard to the lavas of Vesuvius, I determined, during an eruption of that volcano, to watch the progress of a current of lava, and I was soon enabled to comprehend this feeming phænomenon, though it is, I fear, very difficult to explain. Certain it is, that the lavas, while in their most fluid state, follow always the laws of other fluids; but when at a great distance from their fource, and confequently encumbered with scoriæ and cinders, the air likewise having rendered their outward coat tough, they will fometimes (as I have feen) be forced up a fmall afcent, the fresh matter pushing forward that which went before it, and the exterior parts of the lava acting always as conductors (or pipes, if I may be allowed the expression) for the interior parts, that have retained their

fluidity from not being exposed to the air."

From the year 1767 to 1779, this gentleman made many curious observations on the lavas of Vesuvius. He found, that they conflantly formed channels in the mountain as regular as if they had been made by art; and that, whilft in a flate of perfect fusion, they continued their course in those channels, which were fometimes full to the brim, and at others more or less fo according to the quantity of matter thrown out. These channels, after fmall eruptions, were generally from two to five or fix feet wide, and feven or eight in depth. They were often hid from the fight by a quantity of fcorize that had formed a crust over them, and the lava, having been conveyed in a covered way for fome yards, came out again fresh into an open channel. Our author informs us, that he had walked in fome of these subterraneous galleries, which were exceedingly curious, the fides, top, and bottom, being exceedingly fmooth and even: others were incruited with what he calls very extraordinary fcoriæ, beautifully ramified white falts in the form of dropping flalactites, &c.

On viewing a stream of lava while in its fluid state in the month of May 1779, he perceived the operation of it in the channels above described in great perfection. After quitting them, it spread itself in the valley, and ran gently like a river that had been fro-

Vol. IX. Part II.

it, which was infantly put in execution without any other inconvenience than the violent heat with which the legs and feet were affected. The crust was fo tough, that their weight made no impression upon it, and the motion fo flow that they were in no danger of falling. This circumstance, according to Sir William, points out a method of escape should any person happen to be inclosed betwixt two lavas, but ought never to be tried except in cases of real necessity; and indeed, if the current of melted matter was very broad. must undoubtedly be attended with extreme danger, both from the heat of the upper cruft and the chance of its breaking and falling down with the paffenger into the burning liquid below. That which Sir William Hamilton croffed was about 50 or 60 feet broad.

Having passed this burning stream, our travellers walked up along the fide of it to its very fource. Here they faw it boiling and bubbling violently up out of the ground, with a hiffing and crackling noise like that which attends the playing off an artificial fire-work. An hillock of about 15 feet high was formed by the continual splashing up and cooling of the vitrified matter. Under this was an arched hollow, red-hot within, like an heated oven; the lava which ran from it being received into a regular channel raifed upon a fort of wall of fcorize and cinders, almost perpendicularly, of about the height of 8 or 10 feet, and much refembling an ancient aqueduct. On quitting this fountain of lava, they went quite up to the crater, where as usual they found a little mountain throwing up stones and red-hot scorize with loud explofions; but the fmoke and fmell of fulphur was fo intolerable, that they were obliged to quit the place with precipitation.

By the great eruption in August 1779, the curious channels above mentioned were entirely deffroyed, the cone of the mountain was covered with a firatum of lava full of deep cracks, from whence continually iffued a fulphureous smoke that tinged the scoriæ and cinders with a deep yellow, or fometimes white tint. The lava of this eruption appeared to be more perfectly vitrified than that of any former one he had obferved. The pores of the fresh lava were generally full of a perfect vitrification, and the fcoriæ themfelves, viewed through a magnifying glass, appeared like a confused heap of filaments of a foul vitrification. When a piece of the folid lava had been cracked in its fall, without feparating entirely, fibres of perfect glafs were always observed reaching from fide to fide within the cracks. The natural fpun-glass which fell in fome places along with the aftes of this eruption, and which has likewife been observed in other places, he is of opinion must have proceeded from an operation of the kind just mentioned; the lava cracking and feparating in the air at the time of its emission from the crater, and by that means spinning out the pure vitrified matter from its pores or cells; the wind at the fame time carrying off the filaments of glass as fast as they were produced

Our author observed a kind of pumice stone sticking to some very large fragments of the new lava. On close inspection, however, he found that this subzen, and had masses of ice soating upon it. The wind stance had been forced out of the minute pores of the happening then to shift, our traveller was so incom- folid lava itself; and was a collection of fine vitrous moded by the smoke, that the guide proposed to cross fibres or filaments confounded together at the time of

Lava. their being pressed out by the contraction of the large fragments of lava in cooling, and which had been bent downwards by their own weight. "This curious fubflance (favs he) has the lightness of a pumice, and refembles it in every respect, except that it is of a darker colour."

> When the pores of this lava were large, and filled with pure vitrified matter, the latter was fometimes found blown into bubbles on the furface; probably by the air which had been forced out at the time the lava contracted itself in cooling; and from these thin bubbles it appeared, that this kind of volcanic glass has much the fame transparency with our common glass bottles, and like them is of a dirty vellow colour; but when large pieces of it were broken off with a hammer, they appeared perfectly black and opaque.

> In the lava of this eruption it was observed, that many detached pieces were in the shape of a barleycorn or plum ftone, fmall at each end, and thick in the middle. Some of these did not weigh above an ounce; but others could not be less than 60 pounds. Our author took them to be drops from the liquid fountain of fire, which might naturally acquire fuch a form in their fall. There were also many other curious vitrifications, different from any he had feen before, mixed with this huge shower of scoriæ and mas-

fes of lava.

In treating of Mount Etna, M. Houel makes mention of a piece of lava which, after having been once ejected by the volcano, was fwallowed up, and thrown out a fecond time. The intense heat to which it was then fubjected, had fuch an effect upon it, that it appeared all full of chinks to a confiderable depth, and which run at right angles to one another. He had also an opportunity of observing to great advantage some of the hollow channels formed by the lavas of Etna fimilar to those described by Sir William Hamilton, but on a much larger scale. Here the great eruption of water in 1755 had overturned, in a vertical direction, an huge tube of this kind for the length of half a mile. The tube itself appeared to be composed of enormous masses, somewhat refembling planks; each two feet thick and twelve or fifteen in breadth, continued in a straight line through the whole of that space. At the same time by the action of the lava a kind of walls had been formed, from ten to fixteen feet in height, and curved at the top. Some of these walls appear rolled together like paper; and M. Houel is of opinion, that these various appearances on the surface of the lava when cooled must have arisen from particles heterogeneous to the real lava; and which detach themselves from it, rifing to the furface under a variety of forms proportioned to the spaces of time taken up in cooling. There crusts are formed of different kinds of fcoriæ and dirty lava, mixed with fand or afhes. At the same place are found also great numbers of small pieces like those of ice heaped upon one another after having floated for fome time on a river. Beneath these the pure lava is met with, and which has evidently been in a flate of perfect fusion. This is extremely dense; and by looking narrowly into its chinks, the compofition of the whole appears to be merely homogeneous. 44 It is curious (fays he) to observe, so near one species of lava which is very pure, another which has likewife arrived at the same place in a fluid state, and has there Lava." undergone fo great a change as scarce to retain an appearance of its original state. It is, however, like iron drofs, in grains of unequal fizes. We find it also at various diffances, fuch as one, two, or more hundred fathoms. It is fometimes found in large pieces like tables, covered over with fharp points, fome longer and others shorter. All these pieces are quite detached from one another, as if they had been brought this ther and scattered from a tumbril. The matter of which the crust of the lava is formed, feems to have iffued from it in the fame manner in which froth rifes upon folution of foap in water. It appears afterwards to have swelled, burft, and assumed its present form, presenting to the view various spaces filled with small loofe stones. A great number of new lavas were likewife observed, all of them putting forth various kinds of efflorescences in great quantity.

The hardness, denfity, and folidity, of lavas, no doubt proceed from the degree of heat to which they have been exposed, and which feems to be greater or less according to their quantity. Hence the Icelandic volcanoes, which pour forth the greatest quantities of lava, produce it also in the greatest degree of liquefaction, and Dr Van Troil observes, that what he saw must have been liquesied to an extreme degree.

The composition of the lavas of different volcanoes, Observaand even of different parts of those of the same volcano, tions on the is extremely different. Sir William Hamilton is of different opinion that this difference in composition contributes composinot a little to the facility or difficulty with which they tions of laafterwards receive earth capable of vegetation. "Some W. Hamile, (fays he) have been in a more perfect state of vitrifi-ton. cation than others, and are confequently lefs liable to the impressions of time. I have often observed on Mount Vefuvius, when I have been close to a mouth from whence the lava was difgorging itself, that the quality of it varied greatly from time to time. I have feen it as fluid and coherent as glass when in fusion; and I have feen it farinaceous, the particles feparating as they forced their way out, just like meal coming from under the grindstones. A stream of lava of this fort being less compact, and containing more earthy particles, would certainly be much fooner fit for vegetation than one composed of the more perfect vitrified matter." Mr Bergman, who has accurately analysed matter." Mr Bergman, who has accurately analyted fome Icelandic lavas, informs us, that one kind is very By Mr fome Icelandic lavas, informs us, that one kind is very By Mr coarse, heavy, and hard, full of bladders, almost black, intermixed with white grains refembling quartz, which in fome places have a figure not very unlike a fquare. This black matter is not attracted by the magnet; but if a piece of it is held against a compass, the needle vifibly moves. When tried in the crucible, it yields from ten to twelve pounds of iron in every hundred weight. It does not diffolve in the least with fal sodæ. and very difficultly with borax, and fcarce at all with urinous falt. It feems to contain a great deal of clay in its composition, which may be extracted by all acid folvents. This last he is likewise, from expe-

in Italy. The white lava, which possesses more or less of those transparent grains or rays with which lavas are generally chequered, does not feem to be of the nature of quartz, as it cannot be attacked by fal fodæ; it is

riments, affured is the case with the lava of Solfaterra

Lava. however, foluble with fome difficulty by borax and fusible urinous salt, or microcosmic acid. These effects are perfectly fimilar to those produced upon the diamond, ruby, fapphire, topaz, and hyacinth. The chrysolite, garnet, tourmalin, and shirl, can neither be diffolved by fal fodæ, though they are fomewhat attacked by it when reduced to a fine powder; and upon the two last mentioned ones it produces a slight effervefeence : on which account, fays Mr Bergman, it is possible that the precious stones found upon Mount Vesuvius, which are fold at Naples, are nearer related to the real precious stones than is generally imagined. He found no fuch grains in a finer kind of lava, quite porous within, and entirely burnt out, and confiderably lighter than the former ones.

The Iceland agate is of a black or blackish brown colour, a little transparent at the thin edges like glass, and gives fire with feel. It cannot eafily be melted by itself; but becomes white, and flies in pieces. It can hardly be diffolved in the fire by fufible urinous falt; but it fucceeds a little better with borax, though with fome difficulty. With fal fodæ it diffolves very little ; though in the first moments some ebullition is perceived, and the whole mass is afterwards reduced to powder. Hence Mr Bergman concludes, that this agate hath been produced by an excessive fire out of the

black lava formerly mentioned.

In the Iceland pumice-stone, quartz and crystals are often found, particularly in the black and reddiftbrown kind. The stones thrown out of the volcano. whether grey, or burnt brown, feemed to confift of a hardened clay, mixed with a filiceous earth. They were sprinkled with rays and grains resembling quartz, and some few flakes of mica. They fused with great difficulty in the fire; with fal fodæ they showed some effervescence at first, but which ceased in a short time. The parts resembling quartz produced no motion at all: from whence Mr Bergman concludes, that the black lava already mentioned proceeds principally from this mass. Several other stones which were sent him from Iceland, Mr Bergman supposed to have no connection with the eruptions, but to have been produced in fome other way.

In Mr Ferber's travels through Italy, we are informed, that he has feen a species of lava so exactly refembling blue iron flags, that it was not to be diffinguished from them but with great difficulty. The same author tells us likewife, that "the Vicentine and Veronese lavas and volcanic ashes contain inclosed several forts of fire-firiking and flint-horn flones, of a red, black, white, green, and variegated colour, fuch as jaspers and agates; that hyacinths, chrysolites, and pietre obsidiane, described by Mr Arduini in his Giornale d'Italia, are found at Leonedo; and that chalcedony or opal pebbles, and noduli with inclosed water-drops, (chalcedonii opali enhydri), are dug out of the volcanic

cineritious hills near Vicenza.

M. Dolomieu confiders the chemical analysis of lava as but of little account. When subjected to the mieu s opi- force of fire a fecond time, they are all of them reducible to the same kind of glass; from which it has been concluded, that all volcanic products have been formed of the same kind of materials, and that the subterraneous fire has always acted on and variously modified the same kind of stone. But an analysis by fire, he justly observes, is of all others the most fallacious. Lava. The fubstances are all fusible, and we have no proper methods of measuring the intensity of our fire; so that the fame substance which to-day may come out of our furnaces untouched, may to-morrow be found completely altered, even though the fire employed should not appear to us to be any more violent than the infoun not appear to us to the state of the cifion the following refult, viz. that an hundred lava. parts of lava contain 49 of filiceous earth, 35 of ar-

gillaceous earth, four of calcareous earth, and 12 of iron. These experiments, however, our author obferves, give us no information with regard to lavas in

general. They only show the composition of the particular specimens that he tried; and even after the defcriptions that he has given, we are a good deal at a loss to discover the species of lava which he subjected to analysis. " It would be as ridiculous (says M. Dolomieu) to apply this analysis to every volcanic product, as it would be to believe that the component parts of a fiffile rock were the same with those of every rock composed of laminæ or thin strata," For these reasons he is of opinion, that, in order to understand the nature of lavas, we should consider not only that of volcanoes themselves, but of the bases on which they rest. Had this been done, we would have found that the volcanic fires generally exist in beds of argillaceous schistus and horn stone; frequently in a species of of the feat porphyry, the gluten of which is intermediate be of volcanic twixt horn-stone and petrofilex; containing a large fire: quantity of schorl, feldt-spar, and greenish quartz or chrysolite, in little rounded nodules. These substances, he tells us, would have been found in those mountains which are called primitive, and in strata buried under beds of calcareous flone; and, among other things, would have convinced us, that the fluidity of lavas does not make them lofe the distinctive characters of their bases. In the mountains called Primitive, those rocks which are affigued as the bases of the more common lavas are found intermixed with micaceous ones, with gneifs, granite, &c. and they generally reft ou maffes of granite. Hence lavas must confist of all these matters, and the fire must act upon them all whenever it meets with them. Our author has conflantly observed, that volcanoes fituated at the greatest distance from the centre of the chain, or group of mountains on which they are established, produce lavas of a more homogeneous composition, and less varied, and which contain most iron and argillaceous earth. Those, on the contrary, placed nearer the centre, are more diversified in their products; containing substances of an infinite variety of different kinds. of the fire, however, he observes, does not long continue among the granites, the inflammation being either extinguished, or returning to the centre of the schistus rocks in its neighbourhood.

From this knowledge of the materials of which lavas are composed, we acquire also a considerable know. Materials ledge of the matters that are found in greatest quantity the earth at in the bowels of the earth. The excavations made by great mines, &c. on the furface of the earth, are mere depths mines, &c. on the lumace of the darth, are fires, flown by feratches in comparison of the depths of volcanic fires, volcanic and as he confiders the mountains themselves as the fires,

By Mr Ferber.

4 E 2

Lava. productions of those fires, it thence follows, that by attentively examining the materials of which they are composed, we may thence determine what kind of fubflances are most common at these great depths in

> Thus our author thinks it probable, that schoenls and porphyries, though rare on the furface, are very common in the internal parts of the earth. As an instance of the truth of his observations, our author informs us, that he was convinced, from no other circumstance but merely inspecting the lavas of Mount Etna, that, infome parts of the island of Sicily, there existed granites, porphyries, with schiftus and argillaceous hornstones. In this opinion he perfished, notwithstanding the generally opposite sentiments of the inhabitants. themselves. He searched in vain three-fourths of the island: and at last found that all the mountains, forming the point of Sicily, called Pelorus, contain rocks of the kind above mentioned. He then faw that the bafe of these mountains was produced under Mount Etna on one fide, and under the Lipari islands on the other. 44 We must, therefore, (says he) believe, that these mountains have furnished the materials on which the volcanoes have, for thousands of years, exerted their power."

> By travelling among those elevations called the Nettunian Mountains, or Mons Pelorus, he was enabled to discover the reason why the products of Etna and the Lipari iflands differ from one another. This, he fave, is the unequal distribution of the granite and schiffus rocks among them. The islands rest almost immediately on the granite, or are separated from it by a very thin fratum of argillaceous rock which contains porphyry; but the Sicilian volcano is fituated on the prolongation of the fchiftous rock, which it must pierce before it reaches the granite; and accordingly very little of its lava feems to have granite for its basis. If the feat of the fire was still more distant from the centre of the mountains, their lavas would be more homogeneous; because the schift, which succeeds to the horn-stone, is less various, and hardly includes any bodies foreign to its own substance. Thus the lavas, in the extinguished volcanoes of the Val di Noto, which lie 15 leagues to the fouth east of Etna, contain neither granite nor porphyry; but have for their bases fimple rocks, with particles of chrysolite and some fchorls.

> To the granites which extend to Metazzo, oppofite to Lipari, he ascribes the formation of pumice ; as they contain an immense quantity of scaly and micaceous rocks, black and white, with fossile granites or gneiss, the basis of which is a very fusible feldt-spar; and these he supposes to be the proper materials of the pumice, having found pieces of them almost untouched in pumice stones. There are beds of almost pure feldt-spar; to the semivitrification of which he ascribes an opaque enamel like lava mentioned in other parts of his works. Few porphyries, however, he acknowledges, are to be met with among the Neptunian mountains, though these stones abound in the lavas of Etna. "They are not diftant (fays he) from the granites; and those I have found have neither the hardness nor perfection of those pieces which I gathered in the gullier, and which had been apparently washed out of the anterior parts of the mountain by water.

But though the porphyrics I faw here bear no propor- Lavetion to those in the products of Etna, I was sufficiently convinced of their existence, and their analogy with those of volcanoes, by discovering that the centre of these mountains contains a great number of them. Pors phyries, in general, are very rare on the furface of the earth. Nature generally conceals them from us by burying them under calcareous strata, or by inclosing them in schistus rocks with which they are almost always mixed: but we are indebted to the labour of volcanoes for informing us that they are among the most common substances in the bowels of the earth ; and they are never fo much difguifed by the fubterranean fire as to be miltaken in the lavas of which they form the basis."

In Cronstedt's Mineralogy we find all the volcanic products classed under the general name of Slags; of

which he enumerates the following species.

1. The Achates Islandicus Niger, or Iceland Agate. It is black, folid, and of a glaffy texture; but in thinpieces: it is greenish, and semitransparent, like bottleglass which contains much iron. It is found in Iceland and in the island of Ascension. The jewellers employ it as an agate, though it is too fost to resist the wear. " The most remarkable thing concerning this (fays he) is, that fuch large folid maffes are found of it, that there is no possibility of producing the like in any glass house. In Magellan's notes on this subject, we find the Iceland agate classed among the transparent basaltes. To the same class belong the Lapis Obsidianus of Pliny, and the Lapis Gallinaceus of Peru, which by its beautiful blackness approaches to the colour of a large black-bird of the crow kind, in that country called the Gallinagov

2. Lapis molaris Rhenanus, Rhenish Millstone, is blackish grey, porous, and perfectly refembling a fort

of flag produced by Mount Vefuvius.

3. Pumen, the pumice-stone. See Pumen.

4. The Pearl-Slag is compounded of white and greenish glass particles, which feem to have been conglutinated while yet foft or in fusion. It is found in

the island of Ascension.

5. Slag fand, or ashes, thrown out by volcanoes in larger or smaller grains. "This (fays Cronfledt) may perhaps be the principle of the Terra Puzzolana, because such an earth is said at this time to cover the ruins of Herculaneum near Naples, which was destroyed by Vesuvius." In the notes, we are informed, that. if the ashes of a volcano be plentifully moistened, they produce that kind of tufa or tophi, traas, and pori, all: of which are nearly of the same kind. Great heaps of tufa or tophi are found in Italy, forming various hills, and covering large tracts of land; from whence it is cut, and carried, for making the walls, vaults, and upper ceilings of houses. It is a very fost kind of stone, extremely advantageous for these purposes, on account of its little weight, and being eafily cut into any form. The inhabitants of Umbria and other parts of Italy dig with very little labour various fubterranean excavations for the keeping of wines and provifions of different kinds.

Mr Kirwan is of opinion, that the lavas eught to be diftinguished from the other volcanic productions. All lavas, according to him, are magnetic, give fire with steel, are generally of a granular texture, and futible

per fe. They may be reduced to three varieties, viz. the Cellular, the Compact, and the Vitreous. The cellular appear to have undergone only the first degree of fusion, being just mollified and heated fufficiently to expel the fixed air contained in the argillaceous particles. Hence they abound in fmall cavities arifing from the expansion of that air after it had recovered its elattic ftate; and thus they are often fo light as to float upon water, and have been miftaken for pumiceflones. They are of black, grey, brown, or reddish colours; and their cavities are even filled with crystallizations. Of this kind is Cronftedt's fecond species, the millitone of the Rhine. These contain from 45 to 50 per cent. of filiceous earth; from 15 to 20 of iron; four or five of pure calcareous earth; the remainder being argillaceous.

The compact lavas have undergone a more perfect degree of fulion, though even these are not destitute of cavities. They contain finer crystals, or such as are more completely vitrified than the former; they have a black or brown colour: but still their fracture is-obscure and not glassy. Their constituent parts are the fame with the preceding ones; the ufual fluxes attack them with difficulty, and the fulible falt of urine

has scarce any power over them.

The vitreous lava has been more completely melted, and forms vitrifications of different colours, generally black or afh-coloured, but rarely blue or greenish. A species of this was analysed by Mr Bergman, as has been already mentioned, and afforded 49 per cent. of-filex, 35 of argillaceous, 4 of calcareous earth, and 12 of iron. Another specimen from the Lipari islands afforded 69 parts of silex, 20 of argillaceous earth, and o of iron. This kind of lava melts by itfelf with great difficulty. The black agate of Iceland belongs to this species, as does also the harder fort of pitch ftone, which gives fire with fteel. This ftone is of various colours, grey, green, black, red, or brown: has a glaffy appearance, being composed of femivitrified fubitances, and melts eafily per fe. It contains 65 per cent, of filex, 16 of argillaceous earth, and four of iron; 14 parts were diffipated in the analysis made by Wiegleb, as Mr Kirwan afferts.

The beds of lava are deepeit and parrowest near the crater, and broader and shallower as they advance. unless some valley intervenes. Pumice-stones lie at a still greater distance: and from these observations, says Mr Kirwan, extinguished volcanoes may be traced.

Cronftedt conjectured that there might be a kind of circulation among the different earths, from the vegetable mould, which he supposed to occupy one extreme, to the flags or volcanic productions, which might be reckoned to occupy another, and back again from the flags to the vegetable mould. " It is obvious (fays he) how the old heaps of flags from the iron furnaces decay, and at last produce vegetables, which eannot be afcribed folely to a black mould carried thither by the wind. The same may perhaps happen with the natural slags in the open air." Other naturalifts have verified this conjecture. All lavas are found to be decomposable by long exposure to the air, fooner or later according to the quantity of iron and calcareous earth they contain, and according as their fufion was more or less complete. Sir William Hamil-

ton has concluded that they gain only one or two feet Lavs. mould in 1000 years; from which, and Roupero's calculations, extravagant ideas have been formed of the duration of the world; but all these are found, when properly examined, to be built on a false foundation. See the article EARTH, nº 176, 177.

The quantity of matter thrown out from volcanoes under the name of lava is prodigious. Af Valt quanter the great eruption of Etna in 1669, Borelli va thrown went from Pifa to Sicily to observe the effects of out.

it. The matter thrown out at that time amounted to 93,830,750 cubical paces; fo that, had it been extended in length upon the furface of the earth, it would have reached more than four times round the whole earth. All this matter, however, was not lava, but confifted also of fand, stone, gravel, &c. The lava he computed at 6,300,000 paces, which formed a river, according to our author, fometimes two miles broad; but according to others it was fix or feven miles broad, and fometimes 20 or 30 yards in depth. Sir William Hamilton informs us, that the lavas of Etna are very commonly 15 or 20 miles in length, fix or feven in breadth, and 50 feet deep. The most confiderable is scarce less than 30 miles long and 15 broad. The most considerable lavas of Vesuvius do not exceed feven miles in length. The fame author, however, tells us, that the lava which iffued from Vesuvius in 1767, was fix miles long, two in breadth, and in most places 60 or 70 feet deep. In one place it had run along a hollow-way made by currents of rain not less than 200 feet deep and 100 wide; and this vaft hollow it had in one place filled up. He fays, he could not have believed that fo great a quantity of matter could have been thrown out in fuch a short time, if he had not examined the whole course of it himself. Even this quantity, however, great as it is, appears very triffing in comparison of that thrown out in Iceland in the year 1783, which covered a space of ground 90 miles in length and 42 in breadth, to the depth of more than 100 feet. Dr Van Troil, in his Letters on Iceland, tells us, that he and his companions travelled over a tract of lava upwards of 300 miles in length: and in 1728, we are told that an eruption of lava took place, which continued for two years to run into a great lake, which it almost

As the lavas are thrown out from the volcanoes in Require 23 the highest degree of ignition, it may easily be sup- long time posed that such vast bodies will retain their heat to coolfor a long time. It would indeed be well worth observing, what length of time is required to cool a lava perfectly; as from thence we might in some measure judge how far those philosophers are in the right, who argue concerning the length of time required to cool an ignited globe of the fize of our earth or larger. Sir William Hamilton tells us, that in the month of April 1771, he thrust sticks into some of the crevices of the lava which had issued from Vesuvius in October 1767, and they immediately took fire. On Mount Etna, in 1769, he observed the lava that had been difgorged three years before to fmoke in many parts. No particular observation, however, hath been made in what proportion the heat of lavas is gradually

Cold and

old lavas.

Lavandula relating to a lava in the island called Lacco. Here is a cavern shut up with a door; and this cavern is made use of to cool liquors and fruit, which it does in a fhort time as effectually as ice. Before the door was noxious va- opened, he felt the cold on his legs very fenfibly; but pours pro-duced by when it was opened, the cold rushed out so as to give him pain; and within the grotto it was intolerable. He was not fensible of wind attending this cold; tho' upon Mount Etna and Vefuvius, where there are caverns of this kind, the cold is evidently occasioned by a fubterraneous wind: the natives call fuch places ventaroli. From old lavas there also frequently happens an eruption of noxious vapours called mofetes. Thefe likewife break out from wells and fubterraneous places in the neighbourhood of a volcano before an eruption. Our author tells us, that the vapour affects the noftrils, throat, and stomach, just as the spirit of hartshorn or any strong volatile falt; and would foon prove fatal if you did not immediately withdraw from it. Thefe mofetes, he fays, are at all times to be met with under the ancient lavas of Vefuvius, particularly the great eruption of 1631.

Sir William Hamilton informs us, that the lavas of Etna and Vesuvius are much the same, but those of Etna rather blacker and more porous than those of Vesuvius. Some kinds of lava take a fine polish, and are frequently manufactured into boxes, tables, &c. In Naples, the inhabitants commonly make use of it for paying the ffreets, and even the fubterraneous cities of Pompeii and Herculaneum have been paved with the fame fubflance. A fine large cubic piece of lava is preferred in the hall of the British Museum.

LAVANDULA, LAVENDER: A genus of the angiospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 42d order, Verticillata. The calyx is ovate, and a little dentated, supported by a bractea or floral leaf; the corolla is resupinated; the stamina within the tube.

Species. 1. The fpica, or lavender fpike, hath a fhort shrubby stalk, rising two or three feet high; small fpear-shaped entire leaves; and from the ends of the branches, numerous, long, erect, naked spikes of small ringent flowers, of different colours in the varieties. The varieties of this are common narrow-leaved lavender, with blue flowers, and with white flowers; broadleaved lavender; dwarf lavender; all of them flowering in July. This species is the common lavender: but the narrow-leaved variety, with blue flowers, is the fort commonly cultivated for its flowers for medicine, &c. The steechas, or French lavender, hath a shrubby very branchy flalk, rifing two or three feet high; very narrow, fpear-shaped, pointed, hoary leaves, opposite; and all the branches terminated by fhort bufhy spikes of purple flowers in June and July; fucceeded by feeds in August. There is a variety with white flowers. 3. The dentata, or dentate-leaved steechas, hath a woody stalk, branching on every side three or four feet high; leaves deeply indented in a pinnated manner; and the branches terminated by fealy four cornered spikes of flowers, appearing most part of summer.

Culture. All the forts are propagated plentifully by flips or cuttings of their young shoots in spring. In March or April, take off a quantity of flips or cut-

Sir William Hamilton informs us of a curious fact tings, from three or four to fix inches long; ftrip off Lavaters, the under leaves; then plant them in a shady border, I four inches afunder; give a good watering, repeat it occasionally in dry weather, and the plants will be well rooted in fummer, and each become a good plant fit to be transplanted into any place early in autumn, that is September or October: removing them, if polfible, with balls of earth; and if intended to plant them for use, set them in rows two or three feet asunder, and two feet distance in each row; if any are defigned for the shrubbery, they should be stationed fingly at good diffances near the front. Those of the third fort being tender, should be potted to move to shelter in winter. The lavendula stochas is also often raifed from feed, fown in March or April, in a bed of

> Ules. The two first species are proper both for the kitchen-garden, for medicinal and other familyuses; and to plant in the pleasure-ground to adorn the front of fmall shrubbery compartments, where they will increase the variety very agreeably; and are finelyfcented aromatics, both when growing, and their flowers when gathered, especially those of the first species, which are in great efteem for putting among cloaths, and for diffilling and other economical uses. The flowers of the first fort are gathered for use in July, which being the time of their perfection, cut off the spikes close in a dry day, and tie them in small bunches for use. These and the summits are in a very eminent degree cephalic and nervine. They are given in palfies, vertigos, lethargies, tremors, and fuppreffion of the menstrual evacuation. The compound spirit distilled from them is famous in these and many other like cases. The distilled oil is particularly celebrated for destroying the pediculi inguinales, and other cutaneous infects. If fost spongy paper, dipt in this oil, either alone or mixed with oil of almonds, be applied at night to the parts infected, the infects will certainly, fays Geoffroy, be all found dead in the

> morning.
>
> LAVATERA, in botany: A genus of the polyandria order, belonging to the polyadelphia class of plants; and in the natural method ranking under the 37th order, Columnifera. The exterior calyx is double and trifid; the arilli or feed coats are very many and monospermous. There are several species, most of them herbaceous flowery annuals, or shrubby perennials, growing erect from two or three to eight or ten feet high, garnished with large roundish, heart-shaped, and angular leaves, and quinquepetalous flowers of the mallow kind. They are easily propagated by feed in the open ground in the fpring; and thrive best when fown where they are defigned to remain. The lavatera tribe affect a warm fandy fituation and foil, in which they will fometimes continue to exhibit their beauties for many years; but in general they are fhort-lived, continuing only two'or three years: this renders them peculiarly eligible to be scattered plentifully in a newly made shrubbery; they will add warmth to young plants, and will die away themselves before the spaces they occupy will be required by the furrounding shrubs.

> LAVATORY, or LAVADERO, a name given to certain places in Chili and Peru, where gold is got out of earth by washing.

M. Frezier gives us the following description of the

lavatories

Lubach, landtories of Chili: - They dig deep into the earth, fury; and on the 6th of March 1635-6, he received Laudanum in fuch places as they have reason to expect gold in; the staff of lord high treasurer of England. In order Lauder, and, in order to facilitate this digging, turn a stream of water upon the fpot, loofening the earth as much as possible all the time, that the current may have the greater effect, and tear up the earth more strongly. When they are got to the earth they want, they turn off the stream, and dig dry.

The earth that they now get, is carried on mules, and discharged into a bason, made somewhat in the manner of a fmith's bellows; into which a little rivulet of water runs with a great deal of rapidity, diffolving the parts of the earth, and carrying every thing away with it, excepting the particles of gold, which, by their great weight, precipitate to the bottom of the bason, and mix with fine black fand, where they are almost as much hidden as they were before in the earth

Sometimes they find very confiderable pieces in lavatories, particularly pieces of 24 ounces each .-There are feveral lavatories, where they find pepitas, or pieces of virgin gold, of a prodigious fize. Among others, they tell of one that weighed 512 ounces, bought by the count de la Moncloa, viceroy of Peru.

Nine or ten leagues to the east of Coquimbo, are the lavatories of Andacoll, the gold whereof is 23 carats fine .- Their works here always turn to great profit, exceptin; when the water fails them .- The natives maintain that the earth is creative, that is, it produces gold continually; because, after having been washed 60 or 80 years, they find it impregnated afresh, and draw almost as much out of it as at

LUBACH, a handsome and strong town of Germany, in the circle of Austria, and in Carniola, with a bishop's see, a castle, and very handsome houses. It is feated on a river of the same name, wherein are the largest craw-fish in Europe. E. Long. 14. 45. N.

Lat. 46. 20. LAUD (William), archbishop of Canterbury in the 17th century, was born at Reading in 1573, and educated in St John's college, Oxford, of which he was afterwards a fellow and grammar-reader. In 1610, he went into orders. In 1611, he was elected prefident of St John's college; but his election being disputed, it was confirmed by his majesty. The same year he was sworn the king's chaplain. In 1621, he was nominated bishop of St David's. In 1628, he was translated to the bishopric of London. In 1630. he was elected chancellor of the university of Oxford. In 1633, he attended the king into Scotland, and was fworn a privy counfellor for that kingdom. During his flay in Scotland, he formed the resolution of bringing that church to an exact conformity with the church of England. In the same year, he succeeded archbifhop Abbot in the fee of Canterbury; and foon after came out his majesty's declaration about lawful sports on Sundays, which the archbishop was charged with having revived and enlarged, and that with the vexatious profecutions of fuch clergymen as refused to read it in their churches. In 1634-5, the archbishop

to prevent the printing and publishing what he thought improper books, he procured a decree to be paffed in the star-chamber, on the 11th of July 1637, whereby it was enjoined that the mafter-printers should be reduced to a certain number, and that none of them should print any books till they were licenfed either by the archbishop or the bishop of London, or some of their chaplains, or by the chancellors or vice chancellors of the two univerfities. A new parliament being fummoned, met on the 13th of April 1640; and the convocation the day following: but the commons lanching out into complaints against the archbishop, and infifting upon a redress of grievances before they granted any supply, the parliament was dissolved on the 7th of May. The convocation, however, continued sitting; and made 17 canons, which were supposed to be formed under the immediate direction of the archbishop. In the beginning of the long parliament he was attacked on account of those canons: and they being condemned by the house of commons on the 16th of December 1640, "as containing many things contrary to the king's prerogative, to the fundamental laws and statutes of this realm, to the rights of parliament, to the property and liberty of the subject, and tending to fedition, and of dangerous confequence;" he was, on the 18th of December, accused by the commons of high treason, and fent to the Tower. Being tried before the house of lords, for endeavouring to subvert the laws, and to overthrow the Protestant religion, he was found guilty, and beheaded on Towerhill on January 10th following, in the 72d year of his This learned prelate, notwithflanding his being charged with a defign to bring in Popery, wrote an answer to Dr Fisher, which is esteemed one of the best pieces that has been printed against that religion. He was temperate in his diet, and regular in his private life: but his fondness for introducing new ceremonies, in which he showed a hot and indiscreet zeal, his encouraging of sports on Sundays, his illegal and cruel feverity in the star-chamber and high-commission courts, and the fury with which he perfecuted the diffenters, and all who prefumed to contradict his fentiments, exposed him to popular hatred. Besides his

LAUDATTO, in a legal fense, was anciently the testimony delivered in court of the accused person's good behaviour and integrity of life. It refembled the custom, which prevails in our trials, of calling perfons to speak to the character of the prisoner. The least number of the laudatores amongst the Romans was

Answer to Fisher, he published several Sermons, and

LAUDER (William), a native of Scotland, was educated at the university of Edinburgh, where he finished his studies with great reputation, and acquired a confiderable knowledge of the Latin tongue. In May 22. 1734, he received a testimonial from the heads of the university, certifying that he was a fit person to teach humanity in any school or college was put into the great committee of trade and the whatever. In 1739 he published at Edinburgh an ediking's revenue; on the 4th of March following, he tion of Johnston's Psalms. In 1742, he was recomwas appointed one of the commissioners of the trea- mended by Mr Patrick Cuming and Mr Colin Mac-

Landohn.

Lauder laurin, professors of church-history and mathematics, to the maftership of the grammar school at Dundee, then vacant. Whether he fucceeded in his application or not, is uncertain: but a few years afterwards we find him in London, contriving to ruin the reputation of Milton; an attempt which ended in the destruction of his own. His reason for the attack probably fprung from the virulence of a violent party fpirit, which triumphed over every principle of honour and honesty. He began first to retail part of his defign in The Gentleman's Magazine, 1747; and finding that his forgeries were not detected, was encouraged in 1751 to collect them, with additions, into a volume, intitled, " An Essay on Milton's Use and Imitation of the Moderns in his Paradife Loft." Svo. The fidelity of his quotations had been doubted by feveral people; and the falfehood of them was foon after demonstrated by Dr Douglas, in a pamphlet intitled, "Milton vindicated from the Charge of Plagiarism brought against him by Lauder, and Lauder himself convicted of feveral Forgeries and groß Impositions on the Public : In a Letter humbly addressed to the Right Honourable the Earl of Bath, 1751," 8vo. The appearance of this Detection overwhelmed Lauder with confusion. He subscribed a confession, dictated by a learned friend, wherein he ingenuously acknowledged his offence, which he professed to have been occasioned by the injury he had received from the disappointment of his expectations of profit from the publication of Johnfton's Pfalms. This misfortune he afcribed to a couplet in Mr Pope's Dunciad, book iv. ver. 3. and from thence originated his rancour against Milton. He afterwards imputed his conduct to other motives; abused the few friends who continued to countenance him; and, finding that his character was not to be retrieved. quitted the kingdom, and went to Barbadoes, where he fome time taught a school. His behaviour there was mean and despicable; and he passed the remainder of his life in universal contempt. "He died (fays Mr Nichols) some time about the year 1771, as my friend Mr Reed was informed by the gentleman who read the funeral fervice over him."

LAUDICENI, amongst the Romans, applauders, who for reward entered the rehearfal-rooms, attended the repetition of plays, and were in waiting when orations were pronounced, in order to raile or increase the

acclamation and applaufe.

LAUDOHN (Field-marshal), a celebrated general in the imperial fervice, born in 1716, was a native of Livonia, and descended from a Scottish family. He made his first campaigns under Marshal Munich, in the war of 1738, between the Ruslians and Turks; and was at the taking of Oczakow, Choczim, and Stawutzchane, where the Turks were entirely defeated. Frederick the Great refused, in 1741, to take young Laudohn into his fervice, faying he did not like his countenance; though this monarch, who was confidered as the greatest general of his age, afterwards faid, that he often admired the positions of other generals, but that he had ever dreaded the battles of Laudohn. In 1756, when but just entered into the service of the house of Austria, with the rank of lieutenant-colonel, he made fuch a rapid progress, that within less than a year he was a general of artillery, and within three years commander in chief of the whole army. He Nº 175.

refcued Olmutz, when belieged by the Pruffians; beat the king himself at Frankfort on the Oder; at Zorndorf, took General Fouquet prisoner; carried Glatz and Schweidnitz by affault; and stopped the progress of Frederick in a war which might have proved fatal to the house of Austria. In 1778, when elevated to the rank of marshal, at the head of 60,000 men he hindered Henry, brother to the king of Prussia, from joining his army to that of the king. At Dubicza, Novi, Gradisca, and Belgrade, in the late war between the Emperor and the Turks, he had but to present himself before the place, and say with Casar, Veni, vidi, vici. But at his head-quarters in Moravia, he was feized with a fever, in confequence of an operation he underwent for an obstruction in the urethra. His impatience under the medical applications, the impetuous ardour of his character, and the knowledge, above all, of his importance in the war, contributed to irritate his mind, and promote the violence of the fever. He refifted the application of cataplasms, before and after the incitions were made, with a fatal obstinacy which raifed the inflammation to such a height, that he expired under the accession of the fever on the 14th of July 1700, in the 74th year of his age.

LAUDS, LAUDES, the fecond part of the ordinary office of the breviary, faid after matins; though, here-

tofore, it ended the office of the night. The laudes confift principally of pfalms, hymns, &c. whence they took their name, from laus, laudis,

" praife."

LAVENHAM, or LANHAM, 64 miles from London, is a pleafant and pretty large town of Suffolk, on a branch of the river Bret, from whence it rifes gradually to the top of a hill, where are its church, which is a very handsome Gothic structure, and in which are feveral ancient monuments; and a spacious marketplace, encompaffed with nine streets or divisions, in a very healthy free air. It had formerly a very confiderable trade in blue cloth; and had three guilds or companies, with each their hall. It has still a confiderable manufactory of ferges, shalloons, fays, stuffs, and spinning fine yarn for London; and many hundred loads of wool are delivered in a year from its woolhall. It is governed by 6 capital burgeffes, who are for life, and choose the inferior officers. The church and its fleeple, which is 137 feet high, are reckoned the finest in the county. Its tenor bell, though not much more than a ton, has as deep a note as a bell of twice that weight. Here is a free-school and a bridewell, part of which is a workhouse where the poor children, &c. of the parish are employed in spinning hemp, flax, and yarn; belides which, here are other considerable charicies. The tenants of the manor and the other inhabitants were always exempted from ferving at any court held for its hamlet. They have that tenure of land here which is called Borough English. Its markets are on Tuefday, and on Thurfday for wool. Its fairs are on Shrove-Tuefday, and October 10.

LAVENDER. See LAVANDULA.

LAVER, in scripture history, a facred utenfil placed in the court of the Jewish tabernacle, confisting of a bason, whence they drew water by cocks, for washing the hands and feet of the officiating priests, and also the entrails and legs of the victims.

LAVERNA,

LAVERNA, in antiquity, the goddess of thieves and cheats among the Romans, who honoured her with laughter, public worship, because she was supposed to favour those who wished that their designs might not be difcovered. Varro fays, that she had an altar near one of the gates of Rome; hence called porta lavernalis.

LAUGERIA, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking among those of which the order is doubtful. The corolla is quinquefid: the fruit is a plum with a quinquelocular kernel.

LAUGHTER, an affection peculiar to mankind, secationed by fomething that tickles the fancy.

In laughter, the eye-brows are raifed about the middle, and drawn down next the nose; the eyes are almost shut; the mouth opens and shows the teeth, the corners of the mouth being drawn back and raifed up; the cheeks feem puffed up, and almost hide the eves; the face is usually red, the nostrils are open; and the eves wet.

Authors attribute laughter to the fifth pair of nerves, which fending branches to the eye, ear, lips, tongue, palate, and muscles of the cheek, parts of the mouth, præcordia, &c. there hence arises a sympathy, or confent, between all these parts; so that when one of them is acted upon, the others are proportionably affected. Hence a favoury thing feen, or fmelt, affects the glands, and parts of the mouth; a thing feen, or heard, that is shameful, affects the cheeks with blushes: on the contrary, if it please and tickle the fancy, it affects the præcordia, and muscles of the mouth and face with laughter; if it cause sadness and melancholy, it likewise affects the præcordia, and demonstrates itself by caufing the glands of the eyes to emit tears. Dr Willis accounts for the pleasure of kisling from the fame cause; the branches of this fifth pair being spread to the lips, the præcordia, and the genital parts; whence arifes a fympathy between those parts.

The affection of the mind by which laughter is produced is feemingly fo very different from the other passions with which we are endowed, that it hath engaged the attention of very eminent perfons to find it out .- I. Aristotle, in the fifth chapter of his Poetics, observes of comedy, that " it imitates those vices or meanneffes only which partake of the ridiculous : - now the ridiculous (fays he) confifts of fome fault or turpitude not attended with great pain, and not destructive." 2. " The passion of laughter (fays Mr Hobbes) is nothing elfe but fudden glory ariting from fome fudden conception of fome eminency in ourfelves, by comparison with the infirmity of others, or with our own formerly. For men (continues he) laugh at the follies of themselves past, when they come suddenly to remembrance, except when we bring with them any sudden dishonour." 3. Akenside, in the third book of his excellent poem, treats of ridicule at confiderable length. He gives a detail of ridiculous characters; ignorant pretenders to learning, boattful foldiers, and lying travellers. hypocritical churchmen, conceited politicians, old women that talk of their charms and virtue, ragged philosophers who rail at riches, virtuofi intent upon trifles, romantic lovers, wits wantonly fatirical, fops that out of vanity appear to be discased and profligate, dastards who are passing by night through a church-yard, sings or

Vol. IX. Part II.

ignorant of what they ought to know. Having finish- Laughter. ed the detail of characters he makes fome general remarks on the cause of ridicule; and explains himself more fully in a profe definition illustrated by examples. The definition, or rather description, is in these words, "That which makes objects ridiculous, is fome ground of admiration or effeem connected with other more general circumstances comparatively worthless or deformed : or it is some circumstance of turpitude or deformity connected with what is in general excellent or beautiful; the inconfiftent properties existing either in the objects themselves, or in the apprehension of the person to whom they relate; belonging always to the fame order or class of being; implying fentiment and delign, and exciting no acute or vehement commotion of the heart."-4. Hutcheson has given another account of the ludicrous quality, and feems to think that it is the contrast or opposition of dignity

and meanness which occasions laughter. All these opinions are refuted by Dr Beattie in his

Essay on Laughter and Ludicrous Composition, where he has treated the subject in a masterly manner. "To provoke laughter (fays he), is not effential either to wit or humour. For though that unexpected discovery of refemblance between ideas supposed dissimilar, which is called wit-and that comic exhibition of fingular characters, fentiments, and imagery, which is denominated bumour, -do frequently raife laughter, they do not raife it always. Addison's poem to Sir Godfrey Kneller, in which the British kings are likened to heathen gods, is exquifitely witty, and yet not laughable. Pope's Essay on Man abounds in serious wit; and examples of ferious humour are not uncommon in Fielding's History of Parson Adams, and in Addison's account of Sir Roger de Coverley. Wit, when the subject is grave, and the allusions sublime, raises admiration inflead of laughter : and if the comic fingularities of a good man appear in circumstances of real distress, the imitation of these fingularities in the epic or dramatic comedy will form a species of humour, which, if it should force a smile, will draw forth a tear at the fame time. An inquiry, therefore, into the diffinguishing characters of wit and humour has no necessary connection with the prefent subject,

" Some authors have treated of ridicule, without marking the diffinction between ridiculous and ludicrous ideas. But I presume the natural order of proceeding in this inquiry, is to begin with afcertaining the nature of what is purely ludicrous. Things ludicrous and things ridiculous have this in common, that both excite laughter; but the former excite pure laughter, the latter excite laughter mixed with disapprobation and contempt. My defign is to analyse and explain that quality in things or ideas, which makes them provoke pure laughter, and intitles them to the name of ludicrous

or laughable.

" When certain objects, qualities, or ideas, occur to our fenses, memory, or imagination, we smile or laugh at them, and expect that other men should do the fame. To fmile on certain occasions is not less natural. than to weep at the fight of distress, or cry out when we feel pain.

" There are different kinds of laughter. As a boy, affiamed or afraid without reason, and fools who are whiftles in order to conceal his fear even from himself; 45

Laughter. So there are men, who, by forcing a smile, endeavour ludicrous ideas, is known to every one by experience; Laughterfometimes to hide from others, and from themselves too perhaps, their malevolence or envy. Such laughter is unnatural. The found of it offends the ear; the features difforted by it feem horrible to the eye. A mixture of hypocrify, malice, and cruel joy, thus displayed on the countenance, is one of the most hateful fights in nature, and transforms the " human face divine" into the vifage of a fiend. Similar to this is the fmile of a wicked person pleasing himself with the hope of accomplishing his evil purposes. Milton gives a striking picture of it in that well-known passage:

> He ceas'd; for both feem'd highly pleas'd; and Death Grinn'd horrible a ghaft'y fmile, to hear His famine should be fill'd, and bleft his maw Destin'd to that good hour .-

But enough of this. Laughter that makes man a fiend or a monster, I have no inclination to analyse. My inquiries are confined to that species of laughter

which is at once natural and innocent.

" Of this there are two forts. The laughter occafioned by tickling or gladness is different from that which arises on reading the Tale of a Tub. former may be called animal-laughter: the latter (if it were lawful to adopt a new word which has become very common of late) I should term sentimental. Smiles admit of fimilar divisions. Not to mention the fcornful. the envious, the malevolent fmile, I would only remark, that of the innocent and agreeable fmile there are two forts. The one proceeds from the rifible emotion, and has a tendency to break out into laughter. The other is the effect of good-humour, complacency, and tender affection. This last fort of smile renders a countenance amiable in the highest degree. Homer ascribes it to Venus in an epithet (\$120 mulles of), which Dryden and Pope, after Waller, improperly translate laughter-loving; an idea that accords better with the character of a romp or hoyden, than with the goddess of love and beauty.

" Animal-laughter admits of various degrees; from the gentle impulse excited in a child by moderate joy, to that terrifying and even mortal convulsion which has been known to accompany a change of fortune. This passion may, as well as joy and forrow, be communicated by fympathy; and I know not whether the entertainment we receive from the playful tricks of kittens and other young animals may not in part be refolved into fomething like a fellow feeling of their vivacity .- Animal and fentimental laughter are frequently blended; but it is easy to diffinguish them. The former is often excessive; the latter never, unless heightened by the other. The latter is always pleafing, both in itself and in its cause; the former may be painful in both. But their principal difference is this:-The one always proceeds from a fentiment or emotion excited in the mind, in confequence of certain ideas or objects being prefented to it, of which emotion we may be conscious even when we suppress laughter; -- the other arises not from any sentiment or perception of ludicrous ideas, but from fome bodily feeling, or fudden impulse on what is called the animal spirits, proceeding, or seeming to proceed, from the operation of causes purely material. The present inquiry regards that species that is here distinguished by the name of fentimental laughter.

but, being a fimple feeling, admits not of definition. It is to be diftinguished from the laughter that generally attends it, as forrow is to be difting uished from tears; for it is often felt in a high degree by those who are remarkable for gravity of countenance. Swift feldom laughed, notwithstanding his uncommon talents in wit and humour, and the extraordinary delight he feems to have had in furveying the ridiculous fide. of things. Why this agreeable emotion should be accompanied with laughter as its outward fign, or forrow express itself by tears, or fear by trembling or paleness, I cannot ultimately explain, otherwise than by faying, that fuch is the appointment of the Author of nature .- All I mean by this inquiry is, to determine, "What is peculiar to those things which produce laughter :- or rather, which raife in the mind. that pleafing fentiment or emotion whereof laughter is the external fign."

" Philosophers have differed in their opinions concerning this matter. In Aristotle's definition quoted above, it is clear that he means to characterife, not laughable qualities in general (as fome have thought), but the objects of comic ridicule only; and in this view the definition is just, however it may have been overlooked or despised by comic writers. Crimes and misfortunes are often in modern plays, and were fometimes in the ancient, held up as objects of public merriment; but if poets had that reverence. for nature which they ought to have, they would not shock the common sense of mankind by so absurd a representation .- The definition from Aristotle does not, however, fuit the general nature of ludicrous ideas; for it will appear by and by, that men laugh at that in which there is neither fault or turpitude of

" The theory of Mr Hobbes would hardly have deserved notice, if Addison had not spoken of it with approbation in the 47th paper of the Spectator. He jultly observes, after quoting the words of Mr Hobbes formerly mentioned, that, "according to this account, when we hear a man laugh exceffively, instead of faying that he is very merry, we ought to tell him that he is very proud." It is strange, that the elegant author should be aware of this consequence, and yet admit the theory: for fo good a judge of human nature could not be ignorant, that laughter is not confidered as a fign of pride; perfons of fingular gravity being often suspected of that vice, but great laughers feldom or never. When we see a man attentive to the innocent humours of a merry company, and yet maintain a fixed folemnity of countenance, is it natural for us. to think that he is the humblest, and the only humble person in the circle ?

" Another writer in the Spectator, no 249, remarks, in confirmation of this theory, that the vainest part of mankind are most addicted to the passion of laughter. Now, how can this be, if the proudest part of mankind. are also most addicted to it, unless we suppose vanity and pride to be the fame thing? But they certainly are different paffions. The proud man despites other men, and derives his chief pleasure from the contemplation of his own importance: the vain man stands in need of the applause of others, and cannot be happy without it. Pride is apt to be referved and fullen ; va-"The pleasing emotion, arising from the view of nity is often affable, and officiously obliging. The

proud

fo obvious to all the world, that he will fcarce give himself the trouble to inform you of it : the vain man, to raife your admiration, fcruples not to tell you, not only the whole truth, but even a great deal more. In the fame person these two passions may, no doubt, be united; but fome men are too proud to be vain, and fome vain men are too confcious of their own weakness to be proud. Be all this, however, as it will, we have not as yet made any discovery of the cause of laughter: in regard to which, I apprehend, that the vain are not more intemperate than other people; and I am fure that the proud are much less fo.

" Hutcheson's account of the origin of laughter is equally unfatisfactory. Granting what he fays to be true, I would observe, in the first place, what the ingenious author feems to have been aware of, that there may be a mixture of meanness and dignity where there is nothing ludicrous. A city, confidered as a collection of low and lofty houses, is no laughable object. Nor was that person either ludicrous or ridiculous,

whom Pope fo justly characterifes,

" The greatest, wifest, meanest, of mankind." -But, fecondly, cases might be mentioned, of laughter arifing from a group of ideas or objects, wherein there is no difcernible opposition of meanness or dignity. We are told of the dagger of Hudibras,

- " It could ferape trenchers, or chip bread,
- " Toast cheefe or bacon, though it were "To bait a mouse-trap, 'twou'd not care;
- "Twou'd make clean shoes, or in the earth " Set leeks and onions, and fo forth."

The humour of the passage cannot arise from the meanness of these offices compared with the dignity of the dagger, nor from any opposition of meannels and dignity in the offices themselves, they being all equally mean; and must therefore be owing to some peculiarity in the description. We laugh, when a droll mimics the folemnity of a grave person; here dignity and meanness are indeed united: but we laugh also (tho' not so heartily perhaps) when he mimics the peculiarities of a fellow as infignificant as himfelf, and difplays no opposition of dignity and meanness. The levities of Sancho Panca opposed to the solemnity of his mafter, and compared with his own schemes of preserment, form an entertaining contrast : but some of the vagaries of that renowned fquire are truly laughable even when his preferment and his master are out of the question. Men laugh at puns; the wifett and wittiest of our species have laughed at them ; queen Elisabeth, Cicero, and Shakespear, laughed at them; clowns and children laugh at them; and most men, at one time or other, are inclined to do the fame : but in this fort of low wit, is it an opposition of meanness and dignity that entertains us? Is it not rather a mixture of fameness and diverfity, - fameness in the found, and diverfity in the fignification?

" In the characters mentioned by Akenfide, the author does not diftinguish between what is laughable and what is contemptible; fo that we have no reason to think, that he meant to specify the qualities peculiar to those things which provoke pure laughter; and whatever account we may make of his definition, which to those who acquiesce in the foregoing reasonings

Laughter, proud man is so consident of his merit, and thinks it may perhaps appear not quite satisfactory, there is in Laughter. the poem a paffage that deferves particular notice, as it feems to contain a more exact account of the ludicrous quality than is to be found in any of the theories abovementioned. This paffage we shall soon have occasion to quote."

Our author now goes on to lay down his own theory concerning the origin of laughter, which he fuppofes to arise from the view of things incongruous united in the same assemblage. "However imperfect (says he) the abovementioned theories may appear, there is none of them destitute of merit; and indeed the most fanciful philosopher feldom frames a theory without confulting nature in fome of her more obvious appearances. Laughter very frequently arises from the view of dignity and meannels united in the fame object : fometimes, no doubt, from the appearance of affumed inferiority, as well as of fmall faults and unimportant turpitudes; and fometimes, perhaps, though rarely, from that fort of pride which is described in the pasfage already quoted from Hobbes.

" All these accounts agree in this, that the cause of laughter is fomething compounded; or fomething that disposes the mind to form a comparison, by passing from one object or idea to another. That this is in fact the case, cannot be proved a priori; but this holds in all the examples hitherto given, and will be found to hold in all that are given hereafter. May it not then be laid down as a principle, That laughter arises from the view of two or more objects or ideas disposing the mind to form a comparison? According to the theory of Hobbes, this comparison would be between the ludicrous object and ourfelves; according to those writers who mifapply Aristotle's definition, it would feem to be formed between the ludicrous object and things or persons in general; and if we incline to Hutcheson's theory, which is the best of the three, we shall think

that there is a comparison of the parts of the ludicrous

object, first with one another, and fecondly with ideas

or things extraneous. " Further: every appearance that is made up of parts, or that leads the mind of the beholder to form a comparison, is not ludicrous. The body of a man or woman, of a horse, a fish, or a bird, is not ludicrous, though it confifts of many parts; and it may be compared to many other things without raifing laughter : but the picture described in the beginning of the epiftle to the Pifoes, with a man's head, a horfe's neck, feathers of different birds, limbs of different beafts, and the tail of a fifh, would have been thought ludicrous 1800 years ago, if we believe Horace, and in certain circumstances would no doubt be fo at this day. It would feem then, that 'the parts of a laughable affemblage must be in some degree unsuitable and heterogeneous.'

" Moreover: any one of the parts of the Horatian monster, a human head, a horse's neck, the tail of a fish, or the plumage of a fowl, is not ludicrous in itfelf; nor would those several pieces be ludicrous, if attended to in succession, without any view to their union. For to fee them difposed on the different shelves of a museum, or even on the same shelf, nobody would laugh, except, perhaps, the thought of uniting them were to occur to his fancy, or the passage of Horace to his memory. It feems to follow, that "the incongruous parts of a laughable idea or object must either

Laughter, be combined so as to form an assemblage, or must be intended for a contemptible, personage. He often Laughter, supposed to be so combined."

" May we not then conclude, ' that laughter arises from the view of two or more inconfistent, unfuitable, or incongruous parts or circumstances, considered as united in one complex object or affemblage, or as acquiring a fort of mutual relation from the peculiar manner in which the mind takes notice of them?' The lines from Akenfide formerly referred to, feem to point at the fame doctrine :

Where e'er the pow'r of ridicule difplays Her quaint-eye'd vifage, fome incongruous form, Some Aubborn dissonance of things combin'd, Strikes on the quick observer.

And to the fame purpose, the learned and ingenious Dr Gerard, in his Effay on Tafte: 'The fense of ridicule is gratified by an inconfittence and diffonance of circumstances in the same object, or in objects nearly related in the main; or by a finilitude or a relation unexpected between things on the whole opposite and unlike.'

" And therefore, inftead of faying, with Hutchefor, that the cause or object of laughter is an 'opposition of dignity and meannefs;' I would fay, in more general terms, that it is 'an opposition of suitableness or unfuitableness, or of relation and the want of relation, united, or fupposed to be united, in the same affemblage' Thus the offices afcribed to the dagger of Hudibras feem quite heterogeneous; but we discover a bond of connection among them, when we are told that the fame weapon could occasionally perform them all. Thus, even in that mimicry which displays no opposition of dignity and meannels, we perceive the acanother; that is, a mixture of unfuitablenefs, or want of relation, ariting from the difference of perfous, with congruity and fimilitude, arifing from the fameness of the actions. And here let it be observed in general. that the greater number of incongruities that are blended in the fame affemblage, the more ludicrous it will probably be. If, as in Butler's refemblance of the morning to a boiled lobster, there is a mixture of dignity and meannels, as well as of likenels and diffimilitude, the effect of the contrast will be more powerful, than if only one of these oppositions had occurred in the ludicrous idea. The fublimity of Don Quixote's mind, contrasted and connected with his miserable equipage, forms a very comical exhibition; but when all this is still further connected and contrasted with Sancho Panca, the ridicule is heightened exceedingly. Had the knight of the lions been better mounted and accoutred, he would not have made us fmile fo often; because, the hero's mind and circumstances being more adequately matched, the whole group would have united fewer inconfiftencies, and reconciled fewer incongruities. Butler has combined a still greater variety of uncouth and jarring circumstances in Ralpho and Hudibras: but the picture, though more elaborate, is less natural. Yet this argues no defect of judgment. His defign was, to make his hero not above explanation of the different theories of laughter, only ludicrous, but contemptible; and therefore he referring those who desire further fatisfaction to the jumbles together, in his equipage and perfon, a num-ber of mean and difgufting qualities, pedantry, igno-LAVINGTON-EAST, a town of Wilts, 4 miles rance, nastiness, and extreme deformity. But the fouth of the Devizes, and 89 miles from London. It knight of La Mancha, though a ludicrous, was never is called in our histories Stepult-Lavington; but now

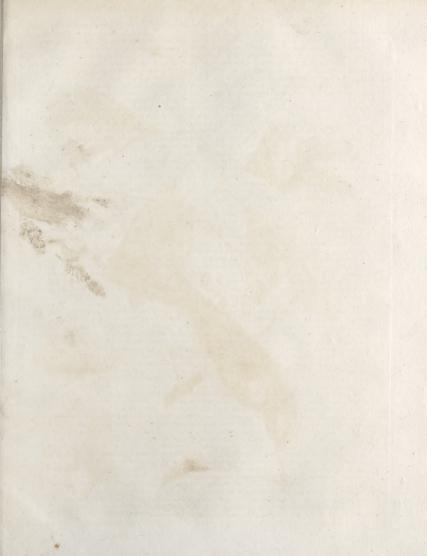

moves our pity, he never forfeits our effeem; and his Lavington adventures and fentiments are generally interesting; which could not have been the case if his story had not been natural, and himself been endowed with great as well as good qualities. To have given him fuch a shape, and fuch weapons, arguments, boots, and breeches, as Butler has bestowed on his champion, would have destroyed that folemnity which is so striking a feature in Don Quixote; and Hudibras, with the manners and perfon of the Spanish hero, would not have been that paltry figure which the English poet meant to hold up to the laughter and contempt of his countrymen. Sir Launcelot Greaves is of Don Quixote's kindred, but a different character. Smollet's defign was not to expose him to ridicule, but rather to recommend him to our pity and admiration. He has therefore given him youth, ftrength, and beauty, as well as courage and dignity of mind; has mounted him on a generous fleed, and arrayed him in an elegant fuit of armour. Yet, that the history might have a comic air, he has been careful to contrast and connect Sir Launcelot with a fquire and other affociates of very diffimilar tempers and circumstances.

" What has been faid of the caufe of laughter does not amount to an exact description, far less to a logical definition: there being innumerable combinations of congruity and inconfittency, of relation and contrariety, of likenefs and diffimilitude, which are not ludicrous at all. If we could afcertain the peculiarities of these, we should be able to characterise with more accuracy the general nature of ludicrous combination. But before we proceed to this, it would be proper to evince, that of the present theory thus much at least is tions of one man joined to the features and body of true, that though every incongruous combination is not ludicrous, every ludicrous combination is incon-

gruous.

" It is only by a detail of facts or examples that any theory of this fort can be either established or overthrown. By fuch a detail, the foregoing theories have been, or may be, shown to be ill-founded, or not fufficiently comprehensive. A single instance of a laughable object, which meither unites, nor is suppofed to unite, incongruous ideas, would likewife flow the infufficiency of the prefent; nor will I undertake to prove (for indeed I cannot), that no fuch instance can be given. A complete enumeration of ludicrous objects it would be in vain to attempt; and therefore we can never hope to ascertain, beyond the possibility of doubt, that common quality which belongs to all ludicrous ideas that are, or have been, or may be, imagined. All that can be done in a cafe of this kind is to prove by a variety of examples, that the theory now. proposed is more comprehensive, and better founded, than any of the foregoing." This our author afterwards shows at full length; but as the variety of examples adduced by him would take up too much room to be inferted here, and as every reader must be capable of adducing numberless instances of ludicrouscases to himself, we shall content ourselves with the

kets, which are on Monday and Wednesday, the last a wilderness. a great corn-market. It is supposed to have been a market-town above 200 years. Here is a charityschool for 36 children, who have books given them,

and the girls are taught to knit and few.

LAVINIUM (anc. geog.), a town of Latium, fix miles to the eaft of Laurentum, according to an ancient map; fo named from Lavinia, confort of A. neas, and daughter of king Latinus, and built by the Trojans. The first town of Roman original in Latium, and the feat of the Dii Penates, (Livy): fituated near the river Numicus, or Numicius; between which and the Tiber Æneas landed, according to Virgil. Holftenius supposes the town to have stood on an eminence, now called il Monte di Levano.

LAUNCE. See LANCE.

LAUNCESTON, a town of Cornwal in England, feated on the river Tamar, 214 miles from London. It is also called Dunhivid, from its fituation on a down. King Henry III. made it a free borough. It was composed before of two other boroughs, viz. Dunhivid and Newport. It has been the place for choosing knights of the shire ever fince the reign of King Edward I. and the affizes town ever fince Richard II. till by a late act of parliament the lord chancellor or lord keeper was empowered to name any other place in the county for it; fince which the fummer assizes have been held at Bodmin. It was incorporated by Queen Mary in 1555. It is governed by a mayor, recorder, and eight aldermen, has a free school which was founded by Queen Elizabeth, and is a populous trading town. Its markets are on Thurfday and Saturday, and it has four fairs. In the 32d of Henry VIII. an act was made for the repair of this and other decayed Cornish boroughs; and it endowed this town with the privileges of a fanctuary, though it does not appear to have used them. It had a monastery and a noble castle, which, because of its strength, was called caftle-terrible, and was given by King Richard I. to his brother, afterwards King John. Here are two charity schools for 48 children of both fexes, where the girls are taught to knit, few, and make bonelace, and are allowed what they can earn. Leland fays it was walled in his time, and one mile in compais. Its lift of burgeffes commences in the 23d of Edward I. The lower part of its ancient castle is made use of for the gaol.

LAUNCH, in the fea-language, fignifies to put out: as, Launch the ship, that is, Put her out of dock; launch aft, or forward, speaking of things that are flowed in the hold, is, put them more forward; launch bo ! is a term used when a yard is hosfted high enough, and fignifies boift no more. See also LANCH

LAUNDER, in mineralogy, a name given in Devonshire, and other places, to a long and shallow trough, which receives the powdered ore after it comes out of the box or cotier, which is a fort of mortar, in which it is powdered with iron peftles, The powdered ore, which is washed into the launder by the water from the coffer, is always finest nearest the grate, and coarfer all the way down.

LAURA, in church-hittory, a name given to a collection of little cells at some distance from each other,

Lavington Cheaping or Market Lavington on account of its mar- in which the hermits in ancient times lived together in Laureste,

These hermits did not live in community, but each monk provided for himself in his diffinct cell. The most celebrated lauras mentioned in ecclefiastical hiftory were in Palestine: as the laura of St Euthymus, at four or five leagues diffance from Jerufalem; the laura of St Saba, near the brook Cedron; the laura of the Towers, near the river lor-

dan, &c.

POET-LAUREATE, an officer of the honfehold of the kings of Britain, whose bufiness confilts only in composing an ode annually on his majesty's birth day. and on the new year; fometimes also, though rarely, on occasion of any remarkable victory .- Of the first inflitution of poets laureate, Mr Wharton has given the following account in his history of English poetry. " Great confusion has entered into this subject, on account of the degrees in grammar, which included rhetoric and verification, anciently taken in our universities, particularly at Oxford: on which occasion, a wreath of laurel was prefented to the new graduate. who was afterwards usually ftyled Poeta Laureatus. These scholastic laureations, however, feem to have given rife to the appellation in question. I will give fome inflances at Oxford, which at the fame time will explain the nature of the fludies for which our academical philologists received their rewards. About the year 1470, one John Watson, a student in grammar, obtained a concession to be graduated and laureated in that science; on condition that he composed one hundred Latin verses in praise of the university, and a Latin comedy. Another grammarian was diftinguished with the same badge, after having stipulated, that, at the next public act, he would affix the fame number of hexameters on the great gates of St Mary's church. that they might be feen by the whole university. This was at that period the most convenient mode of publication. About the same time, one Maurice Byrchenfaw, a scholar in rhetoric, supplicated to be admitted to read lectures, that is, to take a degree in that faculty; and his petition was granted, with a provision, that he should write one hundred verses on the glory of the university, and not staffer Ovid's Art of Love, and the Elegies of Pamphilus, to be studied in auditory. Not long afterwards, one John Bulman, another rhetorician, having complied with the terms imposed, of explaining the first book of Tully's Offices. and likewife the first of his Epistles, without any pecuniary emolument, was graduated in rhetoric; and a crown of laurel was publicly placed on his head by the hands of the chancellor of the university. About the year 1489. Skelton was laureated at Oxford, and in the year 1493 was permitted to wear his laurel at: Cambridge. Robert Whittington affords the last instance of a rhetorical degree at Oxford. He was a fecular prieft, and eminent for his various treatifes in grammar, and for his facility in Latin poetry: having exercifed his art many years, and submitting to the customary demand of an hundred verses, he was honoured with the laurel in the year 1512. " With regard to the poet-laureate of the kings of

England, he is undoubtedly the same that is ftyled the king's versifier, and to whom 100 shillings were paid as

Laureate his annual stipend in the year 1251. But when or wolf. She afterwards married a very rich man, who Laureatia how that title commenced, and whether this officer brought her great wealth, which, at her death, she was ever folemnly crowned with laurel at his first invefliture, I will not pretend to determine, after the they performed to her these honours; though others refearches of the learned Selden on this question have proved unfuccefsful. It feems most probable, that the barbarous and inglorious name of verfifier gradually gave way to an appellation of more elegance and dignity: or rather, that at length those only were in general invited to this appointment, who had received academical fanction, and had merited a crown of laurel in the universities for their abilities in Latin composition, particularly Latin versification. Thus the king's laureate was nothing more than ' a graduated rhetorician employed in the fervice of the king.' That he originally wrote in Latin, appears from the ancient title verfificator: and may be moreover collected from the two Latin poems, which Baston and Gulielmus, who appear to have respectively acted in the capacity of royal poets to Richard I. and Edward II. officially composed on Richard's crusade, and Edward's siege of Striveling castle.

"Andrew Bernard, fucceffively poet-laureate of Henry VII. and VIII. affords a flill ftronger proof that this officer was a Latin fcholar. He was a native of Tholouse, and an Augustine monk. He was not only the king's poet-laureate, as it is supposed, but his historiographer, and preceptor in grammar to Prince Arthur. He obtained many ecclefiaftical preferments in England. All the pieces now to be found, which he wrote in the character of poet-laureate, are in Latin. These are, " An Address to Henry VIII. for the most auspicious beginning of the 10th year of his reign, with an Epithalamium on the marriage of Francis the dauphin of France with the king's daughter;" A New Year's Gift for the 1515; and, Verses wishing prosperity to his majesty's 13th year. He has left some Latin hymns'; and many of his Latin profe pieces, which he wrote in the quality of historiographer to both monarchs, are remaining.

" I am of opinion, that it was not customary for the royal laureate to write in English, till the reformation of religion had begun to diminish the veneration for the Latin language; or, rather, till the love of novelty, and a better fense of things, had banished the narrow pedantries of monastic erudition, and taught us to cultivate our native tongue."

LAUREL. See PRUNUS and LAURUS.

LAURELS, pieces of gold coined in the year 1619. with the king's head laureated, which gave them the name of laurels; the 20 s. pieces whereof were marked with XX. the 10s. X. and the 5 s. pieces with V. LAURENS CASTRA. See LAURENTUM.

LAURENTALIA, or LARENTALIA, called also Larentinalia, Laurentales, and Larentales, feafts celebrated among the Romans on the 10th of the kalends of January, or 23d of December, in memory of Acca Laurentia, wife of the shepherd Faustulus, and nurse of Romulus and Remus.

Acca Laurentia, from whom the folemnity took its name, is represented as no less remarkable for the beau; ay of her person, than her lasciviousness; on account of which, she was nick-named by her neighbours lupa, " fhe-wolf;" which is faid to have given rife to the gradition of Romulus and Remus being fuckled by a

left to the Roman people; in consideration whereof present the feast as held in honour of Jupiter Latiaris. See LARENTINALIA and LARES.

LAURENTIUS, one of the first printers, and, according to some, the inventor of the art, was born at Haerlem about the year 1370, and executed several departments of magistracy of that city. Those writers are miltaken who affign to him the furname of Gofter, or affert that the office of ædituus was hereditary in his family. In a diploma of Albert of Bavaria in 1380, in which, among other citizens of Haer. lem, our Laurentius's father is mentioned by the name of Joannes Laurentii filius," Beroldus is called adituus, who was furely of another family: and in 1306 and 1308, Henricus à Lunen enjoyed that office; after whose relignation, Count Albert conferring on the citizens the privilege of electing their ædituus, they, probably soon after, fixed on Laurentius; who was afterwards called Cofter from his office, and not from his family-name, as he was descended from an illegitimate branch of the Gens Brederodia. His office was very lucrative; and that he was a man of great property, the elegance of his house may tellify. That he was the inventor of printing, is afferted in the narrative of Junius. His first work was an Horarium, containing the Letters of the alphabet, the Lord's prayer, the apostle's creed, and two or three short prayers; the next was the Speculum falutis, in which he introduced pictures on wooden blocks; then Donatus, the larger fize; and afterwards the fame work in a less fize. All these were printed on separate moveable wooden types fastened together by threads. If it be thought improbable, that fo ingenious a man fhould have proceeded no farther than the invention of awooden types; it may be answered, that he printed for profit, not for fame; and wooden types were not only at that time made fooner and cheaper than metal could be, but were fufficiently durable for the fmall impressions of each book he must necessarily have printed .- His press was nearly shaped like the common wine-preffes.-He printed some copies of all his books both on paper and vellum .- It has been very erroneously supposed, that he quitted the profession, and died broken hearted; but it is certain, that he did not live to fee the art brought to perfection .- He died in 1440, aged 70; and was fucceeded either by his fon-in-law Thomas Peter, who married his only daughter Lucia; or by their immediate descendants. Peter, Andrew, and Thomas; who were old enough (even if their father was dead, as it is likely he was) to conduct the bufiness, the eldest being at least 23 or 23. What books they printed it is not easy to determine; they having, after the example of Laurentius (more anxious for profit than for fame), neither added to their books their names, the place where they were printed, or the date of the year. Their first essays were new editions of Donatus and the Speculum. They afterwards reprinted the latter, with a Latin translation, in which they used their grandfather's wooden pictures; and printed the book partly on wooden blocks, partly on wooden separate types, according to Mr Meerman, who has given an exact enLaurentium Laurus.

CCLXIV.

graving of each fort, taken from different parts of the fame book, which was published between the years 1442 and 1450. Nor did they stop here: they continued to print feveral editions of the Speculum, both in Latin and in Dutch; and many other works, particularly " Historia Alexandri Magni:" " Flavii Vedatii [for Vegetii] Renati Epitome de Re Militari;" and "Opera varia à Thomas. Kempis." Of each of these Mr Meerman has given an engraved specimen. They were all printed with feparate wooden types; and, by their great neatness, are a proof that the descendants of Laurentius were industrious in improving his invention. Kempis was printed at Haerlem in 1472, and was the last known work of Laurentius's descendants, who foon after disposed of all their materials, and probably quitted the employment; as the use of fufile types was about that time univerfally diffused through Holland by the fettling of Martens at Aloft, where he purfued the art with reputation for upwards of 60 years. See (History of) PRINTING.

LAURENTIUM, or LAURENS CASTRA, (anc. geog.), a town of Latium, supposed to be the royal refidence of those most ancient kings Latinus, Picus, and Faunus, (Virgil). Hither the emperor Commodus retired during a pestilence. Its name was from an adjoining grove of bay-trees, midway between Ostia and Antium. Supposed to have stood in the place now called San Lorenzo; which feems to be confirmed

from the Via Laurentina leading to Rome.

LAURO (Philippo), a celebrated painter, born at Rome in 1623. He learned the first rudiments of the art from his father Balthafar, who was himfelf a good painter. He afterward fludied under Angelo Carofello, his brother-in-law; and proved fo great a proficient, that in a short time he far surpassed his tutor in defign, colouring, and elegance of tafte. He applied himself to painting historical subjects in a small fize, enriching the back-grounds with lively landscapes, that afforded the eye and the judgment equal enter-tainment; but though his fmall paintings are best approved, he finished several grand compositions for altar-pieces that were highly esteemed. He died in 1694; and his works are eagerly bought up at high prices all over Europe.

LAURO, or Lauron (anc. geog.), a town of the Hither Spain, where Cn. Pompeius, fon of Pompey the Great, was defeated and flain. Now Lorigne, five

leagues to the north of Lliria in Valencia.

LAURUS, the BAY-TREE: A genus of the monogynia order, belonging to the enneandria class of plants; and in the natural method ranking under the 12th order, Holoracee. There is no calyx; the corolla is calycine, or ferving in place of the calyx, and fexpartite; the nectarium with three glandules, each terminated by two briftles furrounding the germen. The interior filaments furnished with glandules at the base : the fruit a monospermous plum.

Species. 1. The nobilis, or evergreen bay-tree, is a native of Italy, and hath an upright trunk branching on every fide from the bottom upward; with spearshaped, nervous, stiff, evergreen leaves, three inches long and two broad; and fmall, yellowish, quadrifid, diœcious flowers, fucceeded by red berries in autumn and winter. Of this species there are varieties, with broad, narrow, striped, or waved leaves. 2. The æsti-

valis, or deciduous bay, grows naturally in North Ame- Laurus. rica. It rifes with an upright ftem, covered with a purplish bark; having oblong, oval, acuminated, veined, deciduous leaves, two or three inches long, and half as broad, growing opposite; with small white flowers fucceeded by red berries. 3. The benzoin, or benjamin tree, is also a native of North America; grows 15 or 20 feet high, divided into a very branchy head; with oval, acute, deciduous leaves, three or four inches long, and half as broad; and fmall yellowish flowers, not fucceeded by berries in this country. 4. The faffafras is a native of the fame country. It hath a shrublike straight stem, garnished with both oval and threelobed, shining, deciduous leaves, of different fizes, from three to fix inches long, and near as broad, with small yellowish flowers succeeded by blackish berries, but not in this country. 5. The indica, or Indian bay tree, rifes with an upright straight trunk, branching regularly 20 or 30 feet high; adorned with very large, fpear-shaped, plane, nervous, evergreen leaves on reddish footstalks; and bunches of small whitish-green flowers, fucceeded by large oval black berries which do not ripen in this country. 6. The borbonia, or Carolina red bay-tree, rifes with an upright straight stem, branching 15 or 20 feet high; with large, spear-shaped, evergreen leaves, transversely veined; and long bunches of flowers on red footstalks, succeeded by large blue berries fitting in red cups. 7. The camphora, or camphor-tree, grows naturally in the woods of the weitern parts of Japan, and in the adjacent islands. The root smells stronger of camphor than any of the other parts, and yields it in greater plenty. The bark of the stalk is outwardly somewhat rough; but in the inner furface fmooth and mucous, and therefore easily feparated from the wood, which is dry and of a white colour. The leaves stand upon slender footflalks, have an entire undulated margin, running out into a point; have the upper furface of a lively and shining green, the lower herbaceous and filky; and are furnished with a few lateral nerves, which stretch archwife to the circumference, and frequently terminate in fmall warts; a circumstance peculiar to this species of laurus. The flowers are produced on the tops of footstalks, which proceed from the arm-pits of the leaves; but not till the tree has attained confiderable age and fize. The flower-stalks are slender, branched at the top, and divided into very short pedicles, each supporting a fingle flower. These flowers are white, and confit of fix petals, which are fucceeded by a purple and shining berry of the fize of a pea, and in figure somewhat top-shaped. It is composed of a soft pulpy fubitance that is purple, and has the tafte of cloves and camphor; and of a nucleus or kernel of the fize of a pepper, that is covered with a black, fining; oily corticle, of an infipid tafte. 8. The cinnamomum, or cinnamon-tree, is a native of Ceylon. It hath a large root, and divides into feveral branches, covered with a bark, which on the outer fide is of a greyish brown, and on the infide has a reddish cast: The wood of the root is hard, white, and has no fmell. The body of the tree, which grows to the height of 20 or 30 feet, is covered, as well as its numerous branches, with a bark which at first is green and afterwards red. The leaf is longer and narrower than the common bay-tree; and it is three-nerved, the

Laurus, nerves vanishing towards the top. When first unfolded, it is of a flame colour: but after it has been for fome time exposed to the air, and grows dry, it changes to a deep green on the upper furface, and to a lighter on the lower. The flowers are small and white, and grow in large bunches at the extremity of the branches: they have an agreeable smell, something like that of the lily of the valley. The fruit is shaped like an acorn, but is not fo large. 9. The caffia, or base cinnamon, has lanceolated leaves, triple-nerved. 10. The Perfea, avocado pear tree, or alligator pear, rifes to a confiderable height, with a ftraight trunk, of which the bark and wood are of a greyish colour. The leaves are long, oval, pointed, of a fubftance like leather, and of a beautiful green colour. The flowers are produced in large knots or clusters at the extremities of the branches, and confift each of fix petals disposed in the form of a ftar, and of a dirty white or yellow colour, with an agreeable odour, which diffuses itself to a confiderable diffance. It is a native of the West Indies. .The Persea begins to bear two years and a half, or at most three years after being planted; and, like most of the trees in warm climates, bears twice a There are two other foccies of this genus. but possessed of no remarkable properties.

Culture. The first species is propagated by layers, or by the berries. In order to raife a quantity of these trees by layers, fome flools should be planted for the purpose; and after these are shot about a yard high, the branches must be brought down to the ground in the winter, all the preceding fummer's shoots laid on it, and pegged down (being first slit in the joint), and the leaves taken off, which would otherwise be under ground. In one year's time thefe layers will have taken root; and in the fpring they should be taken up, and planted in the nurfery a foot afunder, in rows two feet distance. After they are planted out, if the weather should prove dry, they must be constantly watered; for without fuch care, it is difficult to make this tree grow. After they have taken well to the ground, they will require no farther trouble than keeping them clean from weeds, and digging between the rows each winter, till they are finally planted out. 2. In order to raise this tree from the berries, they ought to hang on the trees till about January before they are gathered. A well-sheltered spot of ground for the seminary must be made choice of; and having the mould smooth and fine, they should be fown soon after they are gathered, in beds or drills, rather more than half an inch deep. Towards the close of the spring the plants will come up, and during fummer must be duly attended. by watering and weeding. In the winter following, their sheltered situation must not be trusted to, to defend them from the frost : Furze-bushes, or some such things, ought to be fluck in rows between the beds or drills, to guard them from the black frofts. Indeed, without this precaution, if the winter should prove very frofty, few of the young feedlings will be alive in fpring. During the following fummer, weeding and watering must be observed, and the winter after that they should be defended with covering as before; for they will be still in danger of being destroyed by fevere frosts. In the enfuing spring, the strongest may be taken out of the feed beds, and planted in the nurfery

Nº 175.

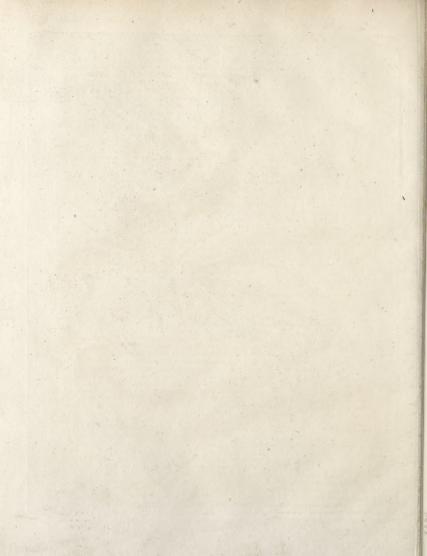

shoots, it will be advisable to let them remain in their Laurus. beds till the third fpring; for a small plant of this kind is with more difficulty made to grow than one which is larger. When they are planted in the nurfery, the diffance which should be allowed them is the fame as the layers, a foot afunder and two feet distance in the rows; and this will not be found too close : for notwithstanding the greatest care is exerted in planting them in the nurfery, even making choice of rainy and cloudy weather, which must always be obferved in fetting them out, many of them will be loft by being transplanted. After they are thus planted out in the nursery, whether layers or feedlings, they must be full watered in dry weather, kept free from weeds, and the rows dug between every winter. You will even find, that those plants which suffer least by heing transplanted will have met with a check, which they will not recover in two or three years; and till they have acquired new strength they should not be taken from the nursery; but when they appear to be good stiff plants, having the year before made a vigorous shoot. they will be then proper plants for planting out where they are to remain. Holes should be got ready for their reception; and as foon as the first autumnal rains fall, the work thould be fet about, especially if the land be gravelly or dry; but if it be moift, the fpring will do as well. Being now planted at one yard diflance, they will make a poor progress for two or three years more; but after this, when they have overcome all these difficulties, they, will grow very fait, and arrive to be good trees in a few years. Although this tree flourishes best in old gardens, where the foil has been made rich and deep, and loves the shade, Hanbury tells us, " it thrives nevertheless exceedingly well in our hottest gravels and fands; and after it has furmounted the hardships of transplanting, will grow in fuch fituations extremely fast, and arrive to a large bulk."

The propagation of the three next forts of trees may be performed two or three ways, I. By the feeds. These we receive, from the places where the trees grow naturally, in the spring. They should be preserved in fand; and as foon as they arrive, should be fown in largish pots an inch deep. The foil for their reception should be taken from a rich pasture at least a year before, with the sward. It should also be laid on an heap, and frequently turned, until the fward is grown rotten, and the whole appears well mixed and fine. If the pasture from whence it was taken near the surface is a fandy loam, this is the best compost for these feeds: if not, a small addition of drift or sea fand should be added, and well mixed with the other mould. After filling the pots with this foil, the feeds should be fown an inch deep; and then they should be plunged into common mould up to the rim. If the foil be naturally moift, it will keep them cooler, and be better; and if the place be well sheltered and shaded, it will be better full. Nothing more than weeding, which must be conftantly observed during the summer, will be necesfary; and in this station they may remain until the March following: about the middle of which month, having prepared a good hot-bed, the pots should be taken up and plunged therein. Soon after the feeds will come up; and when the young plants have fufficientway; though, if they have not by that time made good ly received the benefit of this bed, they should be enu-

Laurus Cinnamonum.

Tlate CCLXIV.

Laurus, red by degrees to the open air. Weeding and watering must be observed during the summer; and at the approach of the cold weather in the autumn, they should be removed under an hot-bed frame, or some cover, to be protected from the frosts during the winter. In the fpring, when this danger is over, they should resume their first station; namely, the pots should be plunged up to the rim, as when the feeds were first fown; and if this place be well sheltered, they may remain there all winter; if not, and fevere froits threaten, they should be taken up and placed under cover as before. After they have been thus managed three years from the feeds, they should be taken out of the pots with care, and planted in the nurseryground at fmall diffances, where they may remain until they are ftrong enough to be finally fet out. By fowing the feeds in pots, and affifting them by an hotbed, a year at least is faved; for they hardly ever come up, when fown in a natural border, under two years from the feeds; nay, they have been known to remain three, and even fome plants to come up the fourth year after fowing; which at once shows the preference of the former practice, and should caution all who have not fuch convenience, not to be too hafty in diffurbing the beds when the feeds are fown in the natural ground; as, especially if they are not well preferved in mould or fand, these may be some years before they appear. Indeed, it is the long time we are in obtaining these plants, either by seeds, layers, &c. that makes them at prefent fo very fcarce amongst us. 2. These plants may also be increased by layers; but very flowly; for they will be two, and fometimes three, or even four years, before they have ftruck out good roots; though the Benjamin tree is propagated the fastest by this method. The young twigs should be laid in the ground in the autumn; and it will be found that twifting the wire round the bud, fo as in fome degree to stop the progress of the sap, and taking away with a knife a little of the bark, is a more effectual method of obtaining good roots foon than by the flit or twifting, especially when practifed on the fasfafras tree. 3. Plants of these forts are likewise sometimes obtained by fuckers, which they will at all times throw out, and which may be often taken off with pretty good roots; but when they are weak, and with bad roots, they should be planted in pots, and assisted by a moderate heat in a bed : With fuch management they will be good plants by the autumn, and in the fpring may be planted out any where. 4. Cuttings of these trees, when planted in a good bark bed, and duly watered, will also oftentimes grow. When this method is practifed, and plants obtained, they must be inured by degrees to the open air, till they are hardy enough to be

finally planted out. The Indian bay, the camphor, the avocado, and the cinnamon-tree, require the treatment common to green-house plants; the latter, however, is rather a flove plant in this country .- Of its culture or propagation in its native places, no particular account has been given by botanical writers; but it must now become an important confideration with us, fince this valuable tree has been acquired by our own colonies. Of the advantages promifed by this acquisition we are indebted for the first accounts to Dr Wright in 1787+; and Vol. III. from whom also we learn that its propagation is very

eafy, and its culture requires little care, as more parti- Laurus. eafy, and its culture requires inthe care, as had cularly noticed below. Since that time, fome observations by Dr Dancer, relative to its cultivation, have appeared in the Transactions * of the Society of Arts, * Vol. VIII. &c. These observations confirm, without adding any P. 214. &c. thing effential to the concise notice of Dr Wright. We are informed, that as the tree " puts out numerous fide-branches, with a denfe foliage, from the very bottom of the trunk; this furnishes an opportunity of obtaining plenty of layers, and facilitates the propagation of the tree, as it does not perfect its feeds in any quantity under fix or feven years : when it becomes fo plentifully loaded, that a fingle tree is fufficient almost for a colony. It feems to delight in a loofe moift foil, and to require a fouthern aspect; the trees, thus planted, flourishing better than others growing in loam, and not fo well exposed to the fun. When healthy, it is (from layers) of a pretty quick growth, reaching in eight years the height of fifteen or twenty feet, is very spreading, and furnished with numerous branches of a fit fize for decortication. The feeds, however, are a long time in coming up, and the plants make small progress for the first year or two." It is added, that "the birds appear to be very fond of the berries, and will probably propagate this tree in the same way they do many others every where over the ifland; fo that in a fhort time it will grow foontaneously, or without cultivation." The age for decortication, faid- above to be

Ules. Evelyn favs, he has feen bay trees near 20 feet high, and almost two feet in diameter; and enumerates the bay amongst useful trees. Hanbury catches at this idea, and tells us in general terms, that " it will grow to 30 feet in height, with a trunk of two feet in diameter;" and accordingly he arranges it among his forest trees: he acknowledges, however, at the same time, that the wood is of little value. The bay is nevertheless a fine aromatic and a beautiful evergreen: It is faid to be the true laurus or laurel of the ancients, with which they adorned the brows of their fuccefsful generals. Like the holly, box, and laurel, the bay will bear the shade and drip of taller trees; and it is upon the whole a very defirable, as being a

eight years, it will be observed, is different from that

specified below for the trees in Ceylon,

very ornamental, evergreen. The leaves and berries of this tree have a moderately ftrong aromatic fmell, and a warm, bitterifh, pungent talte : the berries are stronger in both respects than the leaves, and afford in diffillation a larger quantity of effential aromatic oil; they yield also an almost insipid oil to the press, in consequence of which they prove unctuous in the mouth. They are warm carminatives, and fometimes exhibited in this intention against statulent colics, and likewise in hysterical disorders. Their principal use in the present practice is in glyfters, and fome external applications. The deciduous bay, in a moist rich foil, in which it principally delights, will grow to be about 16 feet high; but in some soils, that are possessed of the opposite qualities, it will hardly arrive at half that height. The flowers are succeeded in May by large red berries, which never ripen in England: fo that, not with standing the leaves in fummer are very pretty, and the colour of the bark makes a variety in winter, it is prin-

part 3.

Vol. IX. Part II.

Laurus. cipally the fearcity of this plant which makes it valuable

The benzoin tree will grow to a much larger fize than the other, and its branches are more numerous. They are finouth, and of a fine light-green colour. The leaves on their upper furface are fmooth and of a fine light-green colour, but their under furface is venofe, and of a whitih caft. When bruiled, they emit a fine fragrance. This tree was formerly miltaken for that which produces the drug called benzoin; which is now known to be obtained from a species of flyrax. See Styr&A.

The fulfafras will grow to neasly the height of the others, though the branches are not on numerous. Its bark is fmooth, and of a red colour, which beautifully diffinguifhes it in winter; whilft the fine fining green of its leaves confinitures its greateft beauty in fummer. In thefe, indeed, there is a variety, and a very extraordinary one. Some are large, and of an oval figure; others are finaller, and of the fame fhape; whilt others again are so divided into three lobes, as to refemble the leaves of some forts of the fig. true. In America, the saffafras generally stands single in the woods, and along the sences round the fields. It showers in May before the leaves come out; and being entirely covered with them, it is diffinguished at a great distance by their beautiful yellow colour.

The root of the faffafras has a fragrant fmell, and a fweetish, aromatic, subacrid taste; the bark tastes much stronger than any other part, and the small twigs stronger than the large pieces. It is a warm aperient and corroborant, and frequently employed with good fuccess for purifying and sweetening the blood and juices. For these purposes, infusions made from the rasped root or bark may be drank as tea. In fome constitutions indeed, such liquors are, by their fragrance, apt, on first taking them, to affect the head; but in fuch cases they may be advantageously freed from their flavour by boiling. A decoction of fassafras, boiled down to the confistence of an extract, proves fimply bitterish and subastringent. Hoffman affures us, that he has frequently given this extract to the quantity of a scruple at a time, with remarkable fuccess, for strengthening the tone of the viscera in cachexies; as also in the decline of intermittent fevers, and in hypochondriacal spasms. Sassafras yields in di-Rillation an extremely fragrant oil of a penetrating pungent tafte, fo ponderous (notwithstanding the lightness of the drug itself) as to fink in water. Rectified spirit extracts the whole taste and smell of sassafras ; and elevates nothing in evaporation : hence the spirituous extract proves the most elegant and efficacious preparation, as containing the virtue of the root entire.

The bark of this tree is used by the women in Penfylvania and other parts of North America in dying worfted a fine latting orange-colour, which does not fade in the fun. They use urine instead of alum in kying; and boil the dye in a brafs boiler, because in an iron vassel it does not yield so fine a colour. The wood is made use of for posts belonging to the inclofures, for it is faid to last a long time in the ground: but it is likewise said, that there is hardly any kind of wood which is mere attacked by worms than this when it is exposed to the air without cover; and that in a flort time it is quite worm-eaten through and through.

On cutting some part of the fasfafras tree, or its Laurus. shoots, and holding it to the nose, it has a strong but pleafant fmell. Some people peel the root, and boil the peel with the beer which they are brewing, because they believe it wholesome. For the same reason, the peel is put into brandy either whilft it is diffilling or after it is made. Profesfor Kalm informs us, that a decoction of the root of faffafras in water, drank every morning, is used with success in the dropsy .- When part of a wood is deftined for cultivation, the faffafras trees are commonly left upon it, because they have a very thick foliage, and afford a cool shade to the cattle during the great heats. Some people get their bedposts made of fasfafras wood, in order to expel the bugs; for its ftrong fcent, it is faid, prevents those vermin from fettling in them. For two or three years together this has the defired effect, or about as long as the wood keeps its ftrong aromatic fmell; but after that time it has been observed to lose its effect. In Penfylvania fome people put chips of fuffafras into their chefts, where they keep all forts of woollen stuffs, in order to expel the moths (or larvæ or caterpillars of moths or tinies) which commonly fettle in them in fummer. The root keeps its fmell for a long while : Professor Kalm saw one which had lain five or fix years in the drawer of a table, and ftill preferved the ftrength of its fcent. The people also gather its flowers, and use it as tea.

The perfea, or alligator pear tree, is cultivated univerfally in the West Indies by all ranks of people. The fruit is pear fhaped, and from one to two pounds in weight. On removing a green skin or covering, we come to a vellow butyraceous substance; and in the heart find a large round feed or flone, which is unequal in the furface, and exceedingly hard and woody. This fruit is ripe in August and September, and constitutes one of the most agreeable articles of diet for fix or eight weeks to the negroes. These pears, with a little falt and a plantain or two, afford a hearty meal. They are also served up at the tables of white people as choice fruit. When the pear is ripe, the yellow or eatable fubstance is firmer than butter, and tastes somewhat like butter or marrow : hence it is called by fome the vegetable marrow. But however excellent this fruit is when ripe, it is very dangerous when pulled and eaten before maturity. Dr Wright fays, he has repeatedly known it to produce fever and dyfentery, which were removed with difficulty .- The leaves of this tree and those of the bead-vine or wild liquorice are made into pectoral decoctions by the common people. - The large stone is used for marking linen. The cloth is tied or held over the stone, and the letters are pricked out by a needle through the cloth and into the feed. The flain is a reddish brown, which never washes out .--The buds of the alligator tree are faid to be used with fuccess in ptisans against the venereal disease. An infusion of them in water, drank in the morning fafting, is strongly recommended for dislodging coagulated blood in the stomach produced by a fall or a fevere stroke on that important entrail. " The wild boars in the East Indies (fays Labat) eat greedily of the mammees and avocado pears, which give their flesh a luscious and most agreeable favour."

Caffia. The bark of this species is known in the shops by the name of caffia lignea. This bark, which

Kalm's Travels in America. and from China, has a very near refemblance to the cinnamon; though diftinguishable from it by being of a thicker and coarfer appearance, and by its breaking fhort and fmooth, while the cinnamon breaks fibrous and fhivery .- It refembles cinnamon still more exactly in its aromatic flavour than in its external appearance; and feems only to differ from it in being fomewhat weaker, in abounding more with a viscous mucilaginous matter, and in being less aftringent. Accordingly, it has not only a place in the Edinburgh pharmacopæia, but is also the basis of a distilled water. It is perhaps furprifing that the London college have given it no place in their lifts. But although it does not enter their pharmacopœia, yet [we may venture to affert, that it will not be neglected by the apothecaries. At prefent it is very common with many of them to fubilitute the cassia in every case for the more expensive article cinnamon; and indeed almost the whole of what is at present fold under the title either of simple or spirituous cinnamon-water is entirely prepared from caffia; and not even entirely from the bark, but from a mixture of the bark and buds.

Cinnamon is the under-bark of the cinnamomum. The best season for separating it from the outerbark, which is grey and rugged, is the fpring, when the fap flows in the greatest abundance. It is cut into thin flices, and exposed to the fun, and curls up in drying .- The old trees produce a coarfe kind of cinnamon; the fpice is in perfection only when the trees are not older than three or four years. When the trunk has been ftripped of its bark, it receives no further nourishment; but the root is still alive, and continues to throw out fresh shoots. The fruit of the tree is shaped like an acorn, but is not so large. Its feed, when boiled in water, yields an oil which fwims at top, and takes fire. If left to cool, it hardens into a white fubstance, of which candles are made, which have an agreeable fmell, and are referved for the use of the king of Ceylon. The cinnamon is not reckoned excellent unless it be fine, smooth, brittle, thin, of a vellow colour inclining to red; fragrant, aromatic, and of a poignant, yet agreeable tatte. The connoiffeurs give the preference to that the pieces of which are long, but slender. That which comes to us is generally mixed with the Cassia bark; but this last is and has a roughness along with its aromatic flavour; while the Cassia breaks over smooth, and has a mucilaginous tafte. Cinnamon is a very elegant and ufeful aromatic, more grateful both to the palate and stomach than most other substances of this class. By its astringent quality it likewise corroborates the viscera, and proves of great fervice in feveral kinds of alvine fluxes, and immoderate discharges from the uterus.

The cinnamon plant, with other valuable ones, was taken in a French ship by Admiral Rodney in the last war, and prefented by him to the affembly of Jamaica. One of the trees was planted in the botanic garden in St Thomas in the East; the other by Hinton East, conclude that they have been entirely ignorant of the Efg; in his noble garden at the foot of the Blue Mountains. From these parent trees some hundreds of young camphire does not drop to the earth, like the gums of trees are already produced from layers and cuttings, certain refinous trees, which are preferved by difcharand dispersed to different parts of the country, in all ging that part of their substance which is too oily;

Laurus. is imported from different parts of the East Indies may therefore hope it will foon be a valuable addition Laurus. to our commerce. Upon comparing the parts of the tree with the description and figure given by Burman and other botanists, it appears to be the real Cevlon cinnamon, and of the best kind, called by the natives Rafle Goronde: but the specimens of bark taken put it out of all doubt, being, in the opinion of the best judges, of an equal, if not fuperior, quality to any imported from India. The fmallest bit of the bark, Dr Wright affures us, is quite a cordial. The cinnamon we have from Holland, he observes, is often inert, and gives room to suspect that it has been subjected to a flight process in distillation.

In regard to the trees growing in Jamaica, Dr Dancer informs us in his paper already quoted, that " The best cinnamon bark, according to the different trials I have made, is taken from the fmall branches, of about an inch diameter, the larger limbs not being so easily decorticated, and not yielding so good or fo ftrong a cinnamon. The smaller twigs, or those that have not acquired a cineritious bark, are too full of fap and mucilage, and have little aroma. It is the liber, or inner bark, that constitutes the cinnamon; from which the two external barks must be carefully and entirely feparated, or they vitiate the flavour of the cinnamon; to do which with dexterity. and to raise the bark from the wood, requires some practice. The bark being feparated, the fmaller pieces are to be placed within the larger; which, by exposure to the fun or the air, prefently coil up, and require no further preparation. A dry season is the proper one for taking the bark; as it is found to be weakened after long or heavy rains. Cinnamon, though more retentive of its virtues than any of the other fpices, yet requires to be protected, when taken from the air and moisture, by close packing in cedar chests .- The leaves of this tree, whether recent or dried, are so strongly impregnated with an aroma, as to afford a good fuccedaneum for the bark both in cookery and medicine. Distilled. they give an excellent fimple and spirituous water, and an effential oil. Powdered, they are a good aromatic fpecies, or marefchal perfume."

Camphor, though folid, is the effential oil of the laurus camphora; and is obtained from it by distillation in the East Indies. (See the article CAMPHORA) .-This tree is another of the captured plants given to eafily diftinguished. Cinnamon splinters in breaking, the inhabitants of Jamaica; and, if cultivated with care, will also be an useful acquisition.

The Abbe Grofier informs us, that in China forme of these trees are found above 100 cubits in height. and so thick that 20 persons cannot inclose them. The tree is there called tchang; and it is faid that the trunk. when old, emits sparks of fire, but of fo fubtle a nature as not even to injure the hair of those who are near it. Common camphire cofts only a penny the ounce at Pe-king; but it is inferior to that of Borneo, in the judgment even of the Chinese.

The manner in which fome authors have fooken of Camphire (the Abbe observes), gives us reason to process employed to obtain this falutary gum. The which it thrives luxuriantly with little trouble; we neither does it diftil from the top to the bottom of the 4 G 2

Laurus, tree through an incision made in it. The Chinese would practife this method could it be employed with fuccess: for it is very common in China to make such kind of incitions in refinous trees. The method used by the Chinese for obtaining camphire is as follows .--They take some branches fresh from the tchang, chop them very fmall, and lay them to fleep in spring-water for three days and three nights. After they have been foaked in this manner, they are put into a kettle, where they are boiled for a certain time, during which they keep continually ftirring them with a flick made of willow. When they perceive that the fap of thefe fmall chips adheres fufficiently to the flick in the form of white frost, they strain the whole, taking care to throw away the dregs and refuse. This juice is afterwards poured gently into a new earthen bason well varnished, in which it is suffered to remain one night. Next morning it is found coagulated, and formed into a folid mass. To purify this first preparation, they procure fome earth from an old earthen wall, which, when pounded and reduced to a very fine powder, they put into the bottom of a bason made of red copper; over this layer of earth they spread a layer of camphire, and continue thus until they have laid four firata. The laft, which is of very fine earth, they cover up with the leaves of the plant po-ho, or pennyroyal; and over the whole they place another bason, joining it very closely to the former by means of a kind of red earth that cements their brims together. The bason thus prepared is put over a fire, which must be managed so as to keep up an equal heat : experience teaches them to observe the proper degree. But above all, they must be very attentive lest the plafter of fat earth which keeps the basons together should crack or fall off; otherwife the spirituous parts would evaporate and ruin the whole process. When the bafons have been exposed to the necessary heat, they are taken off and left to cool; after which they are feparated, and the fublimated camphire is found adhering to the cover. If this operation be repeated two or three times, the camphire is found purer and in larger pieces. Whenever it is necessary to use any quantity of this fubitance, it is put between two earthen veffels, the edges of which are furrounded with feveral bands of wet paper. These vessels are kept for about an hour over an equal and moderate fire; and when they are cool, the camphire is found in its utmost perfection and ready for use. I'his method of procuring camphire, even from the heart of the tree, may be practited in all feafons of the year; which would not be the case (our author observes), were it extracted like other refinous fubftances that only flow during a certain fort space of time. Besides, by lopping the branches of the camphire-tree, less hurt is done to it than by making incifions, which are always hazardous.

A

LAUS, or LAOS (anc. geog.), a river of Italy, feparating Lucania from the Bruttii, and running from east to west into the Tuscan sea; with a cognominal bay, and a town, the last of Lucania, a little above the fea; a colony from Sybaris, according to Strabo, Pliny, Stephanus. Both town and river are now called Laino, in the Calabria Citra; and the bay, called Golfo della Scalea, or di Policastro, two adjoining towns, is a part of the Tufcan fea, extending between the promontory Palinurus and the mouth of the Laus.

Laus Pompeia (anc. geog.), a town of Infubria, fituated to the east of Milan, between the rivers Addua and Lamber. A town built by the Boii after their paffing the Alps: its ancient Gaulic name is unknown. Strabo Pompeius, father of Pompey, leading thither a colony, gave it a new name, and conferred the Fus Latii on the ancient inhabitants who remained there. The modern Lodi is built from its ruins, at fome distance off. E. Long. 10. 15. N. Lat. 45. 22.

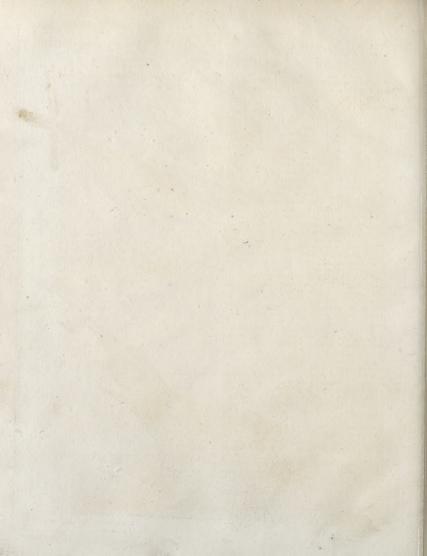

LAUSANNE, a large, ancient, and handsome town of Switzerland, capital of the country of Vaud, and in the canton of Berne, with a famous college and bishop's fee. The town-house and the other public buildings are magnificent. It is feated between three hills near the lake of Geneva, in E. Long. 6. 35. N. Lat. 46. 30 .- The town ftands on an afcent fo fteep, that in fome places the horfes cannot draw up a carriage without great difficulty, and foot-paffengers afcend to the upper part of the town by steps. Here is an academy for the itudents of the country; the professors are appointed by government; and there is a pretty good public library. The church, formerly the cathedral, is a magnificent Gothic building, standing on the most elevated part of the town. Among other iepulchres it contains that of Amadæus VIII. duke of Savoy, flyled the Solomon of his age; bett known by the title of Antipope Felix V. who exhibited the fingular example of a man twice abdicating the fovereignty, and retiring from regal pomp to a private station.

The same year that the country named Pays de Vaud was conquered from the house of Savoy, the inhabitants of Laufanne put themselves under the protection of the Canton of Berne, their bishop having retired from the town. At that time its privileges were confirmed and augmented, and it is still governed by its own magistrates. The citizens of the principal street have the privilege of pronouncing sentence in criminal cases. If the criminal is found, and acknowledges himfelf guilty, the burghers of the ftreet affemble: one of the magistrates pleads in his behalf, and another against him; the court of justice give their opinion upon the point of law; and the majority of citizens possessing houses in the principal street, determine the penalty. In capital cases there is no pardon, according to the letter of the law, unless it can be obtained within 24 hours from the fovereign council of Berne, though it generally happens that eight days are allowed for this purpose. When the criminal is feized within the jurisdiction of the town, the fact is tried, and the burghers pronounce fentence, from which there is no appeal; but if he happens to be taken in the diffrict of the bailiff, there is an appeal tothe government of Berne.

LAVORI (TERRA DI), a province of Italy, in the kingdom of Naples, bounded on the west by the Campagna of Rome, and by Farther Abruzzo; on the north by the Citerior Abruzzo, and by the county of Moliffa: on the east by the Ultra Principata; and on the fouth by the Principata Citra. It is about 63. miles in length and 35 in breadth; and is fertile in corn, excellent vines, and other fruits. There are also feveral mineral fprings and mines of fulphur; Naples is

the capital town.

W.

PART I. OF THE NATURE OF LAWS IN GENERAL.

in general. general.

AW, in its most general and comprehensive sense, A fignifies a rule of action; and is applied indiferiminately to all kinds of action, whether animate or in-Deficition; animate, rational or irrational. Thus we fay, the laws of motion, of gravitation, of optics, of mechanics, as well as the laws of nature and of nations. And it is that rule of action which is prescribed by some superior, and which the inferior is bound to obey.

Thus when the Supreme Being formed the universe, and created matter out of nothing, he impressed certain principles upon that matter, from which it can never depart, and without which it would ceafe to be. When he put that matter into motion, he established certain laws of motion, to which all moveable bodies must conform. And, to descend from the greatest operations to the smallest, when a workman forms a clock, or other piece of mechanism, he establishes at his own pleafure certain arbitrary laws for its direction: as, that the hand shall describe a given space in a given time; to which law as long as the work conforms, for long it continues in perfection, and answers the end of its formation.

If we farther advance, from mere inactive matter to vegetable and animal life, we shall find them still governed by laws; more numerous indeed, but equally fixed and invariable. The whole progress of plants, from the feed to the root, and from thence to the feed again: the method of animal nutrition, digeftion, fecretion, and all other branches of vital economy; are not left to chance, or the will of the creature itfelf, but are performed in a wondrous involuntary manner, and guided by unerring rules laid down by the great Creator.

This then is the general fignification of law, a rule of action dictated by fome fuperior being: and, in those creatures that have neither the power to think nor to will, fuch laws must be invariably obeyed, for long as the creature itself subfilts; for its existence depends on that obedience. But laws, in their more confined fenfe, and in which it is our prefent bufinefs to confider them, denote the rules, not of action in general, but of buman action or conduct: that is, the Particular. precepts by which man, the nobleft of all fublunary beings, a creature endowed with both reason and freewill, is commanded to make use of those faculties in

> Man, confidered as a creature, must necessarily be fubject to the laws of his Creator, for he is entirely a dependent being. A being, independent of any other, has no rule to purfue but fuch as he prescribes to himfelf: but a flate of dependance will inevitably oblige the inferior to take the will of him on whom he depends as the rule of his conduct; not indeed in every

the general regulation of his behaviour.

particular, but in all those points wherein his dependance confifts. This principle therefore has more or less extent and effect, in proportion as the superiority of the one and the dependance of the other is greater or less, absolute or limited. And consequently, as man

depends absolutely upon his Maker for every thing, Of Laws it is necessary that he should in all points conform to in general, his Maker's will.

This will of his Maker is called the law of nature. [aw of For as God, when he created matter, and endued it nature. with a principle of mobility, established certain rules for the perpetual direction of that motion; fo, when he created man, and endued him with freewill to conduct himself in all parts of life, he laid down certain immutable laws of human nature, whereby that freewill is in some degree regulated and restrained, and gave him also the faculty of reason to discover the purport of those laws.

Confidering the Creator only as a being of infinite power, he was able unquestionably to have prescribed whatever laws he pleased to his creature man, however unjust or fevere. But as he is also a Being of infinite wifdom, he has laid down only fuch laws as were founded in those relations of justice that existed in the nature of things antecedent to any positive precept. These are the eternal immutable laws of good and evil, to which the Creator himself in all his dispensations conforms; and which he has enabled human reason to difcover, fo far as they are necessary for the conduct of human actions. Such, among others, are these principles: That we should live honestly, should hurt nobody, and should render to every one his due; to which three general precepts Justinian has reduced the whole doctrine of law.

But if the discovery of these first principles of the law of nature depended only upon the due exertion of right reason, and could not otherwise be obtained than by a chain of metaphyfical disquisitions, mankind would have wanted fome inducement to have quickened their inquiries, and the greater part of the world would have refted content in mental indolence, and ignorance its inseparable companion. As therefore the Creator is a being, not only of infinite power and wifdom, but alfo of infinite goodness, he has been pleased to to contrive the constitution and frame of humanity, that we should want no other prompter to inquire after and pursue the rule of right, but only our own felf-love, that universal principle of action. For he has so intimately connected, fo infeparably interwoven, the laws of eternal justice with the happiness of each individual, that the latter cannot be attained but by observing the former; and if the former be punctually obeyed, it cannot but induce the latter. In confequence of which mutual connection of justice and human felicity, he has not perplexed the law of nature with a multitude of abstracted rules and precepts, referring merely to the fitness or unfitness of things, as some have vainly furmifed; but has graciously reduced the rule of obedience to this one paternal precept, "that man should pur-fue his own happiness." This is the foundation of what we call ethics, or natural law *. For the feveral * See Man articles into which it is branched in our fystems, a-rality. mount to no more than demonstrating, that this or that

welation.

Of Laws action tends to man's real happiness; and therefore very in general, justly concluding, that the performance of it is a part of the law of nature; or, on the other hand, that this or that action is destructive of man's real happiness, and therefore that the law of nature forbids it.

This law of nature, being coëval with mankind, and dictated by God himself, is of course superior in obligation to any other. It is binding over all the globe, in all countries, and at all times; no human laws are of any validity, if contrary to this; and fuch of them as are valid derive all their force, and all their authority, mediately or immediately, from this original.

But in order to apply this to the particular exigencies of each individual, it is still necessary to have recourse to reason; whose office it is to discover, as was before observed, what the law of nature directs in every circumstance of life; by confidering, what method will tend the most effectually to our own substantial happiness. And if our reason were always, as in our first ancestor before his transgression, clear and perfect, unruffled by passions, unclouded by prejudice, unimpaired by difease or intemperance, the task would be pleafant and easy; we should need no other guide but this. But every man now finds the contrary in his own experience; that his reason is corrupt, and his under-

standing full of ignorance and error.

This has given manifold occasion for the benign interposition of Divine Providence; which, in compassion to the frailty, the imperfection, and the blindness of human reason, hath been pleased, at fundry times and in divers manners, to discover and enforce its laws by Law of re- an immediate and direct revelation. The doctrines thus delivered, we call the revealed or divine law, and they are to be found only in the Holy Scriptures. Thefe precepts, when revealed, are found upon comparison to be really a part of the original law of nature, as they tend in all their consequences to man's felicity. But we are not from thence to conclude, that the knowledge of these truths was attainable by reason in its present corrupted state; fince we find, that, until they were revealed, they were hid from the wifdom of ages. As then the moral precepts of this law are indeed of the fame original with those of the law of nature, fo their intrinsic obligation is of equal strength and perpetuity. Yet undoubtedly the revealed law is of infinitely more authenticity than that moral fystem which is framed by ethical writers, and denominated the natural law: because one is the law of nature, expressly declared fo to be by God himfelf; the other is only what, by the affiftance of human reason, we imagine to be that law. If we could be as certain of the latter as we are of the former, both would have an equal authority: but till then they can never be put in any competition together.

Upon these two foundations, the law of nature and the law of revelation, depend all human laws; that is to fay, no human laws should be suffered to contradict these. There are, it is true, a great number of indifferent points, in which both the divine law and the natural leave a man at his own liberty; but which are found necessary, for the benefit of society, to be restrained within certain limits. And herein it is that human laws have their greatest force and efficacy: for, with regard to fuch points as are not indifferent, human laws are only declaratory of, and act in subordination to,

the former. To instance in the case of murder: this Of Laws is expressly forbidden by the divine, and demonstrably in general by the natural, law; and from these prohibitions arises the true unlawfulness of this crime. Those human laws that annex a punishment to it, do not at all increase its moral guilt, or superadd any fresh obligation in fore conscientie to abitain from its perpetration. Nay, if any human law should allow or enjoin us to commit it. we are bound to transgress that human law, or else we must offend both the natural and the divine. But with regard to matters that are in themselves indifferent, and are not commanded or forbidden by those superior laws: fuch, for instance, as exporting of wool into foreign countries; here the inferior legislature has scope and opportunity to interpose, and to make that action unlawful which before was not fo.

If man were to live in a state of nature, unconnected with other dividuals, there would be no occasion for any other laws than the law of nature and the law of God. Neither could any other law poffibly exift: for a law always supposes some superior who is to make it; and in a state of nature we are all equal, without any other superior but him who is the Author of our being. But man was formed for fociety; and, as is demonstrated by the writers on this subject, is neither capable of living alone, nor indeed has the courage to do it. However, as it is impossible for the whole race of mankind to be united in one great fociety, they must necessarily divide into many; and form separate states. commonwealths, and nations, entirely independent of each other, and yet liable to a mutual intercourse. Hence arises a third kind of law to regulate this mutual intercourse, called the law of nations: which, as Law of nations. none of these states will acknowledge a superiority in the other, cannot be dictated by either : but depends entirely upon the rules of natural law, or upon mutual compacts, treaties, leagues, and agreements, between these several communities: in the construction also of which compacts we have no other rule to refort to but the law of nature; being the only one to which both communities are equally subject; and therefore the civil law very justly observes, that quod naturalis ratio in-

ter omnes homines constituit, vocatur jus gentium. To the confideration, then, of the law of nature, Municipal the revealed law, and the law of nations, fucceeds or civillaw. that of the municipal or civil law; that is, the rule by which particular districts, communities, or nations, are governed; being thus defined by Juffinian, "jus ciwile est quod quisque sibi populus constituit." We call it municipal law, in compliance with common speech ; for though, firictly, that expression denotes the particular customs of one fingle municipium or free town, yet it may with fufficient propriety be applied to any one state or nation which is governed by the same laws and

cuftoms.

Municipal law, thus underflood, is properly defined Definedto be " a rule of civil conduct prescribed by the fupreme power in a state, commanding what is right, and prohibiting what is wrong." Let us endeavour to explain its feveral properties, as they arise out of this definition.

And, first, it is a rule? not a transient sudden fes first proorder from a superior to or concerning a particular per-perty. fon; but fomething permanent, uniform, and univerfal. Therefore a particular act of the legislature to confif-

Of Laws cate the goods of Titius, or to attaint him of high treain general fon, does not enter into the idea of a municipal law: for the operation of this act is fpent upon Titius only, and has no relation to the community in general; it is rather a fentence than a law. But an act to declare that the crime of which Titius is accused shall be deemed high treason; this has permanency, uniformity, and universality, and therefore is properly a rule. It is also called a rule, to diftinguish it from advice or counsel, which we are at liberty to follow or not as we fee proper, and to judge upon the reasonableness or unreasonableness of the thing advised; whereas our obedience to the law depends not upon our approbation, but upon the Maker's will. Counfel is only matter of perfuation, law is matter of injunction; counsel acts only upon the willing, law upon the unwilling alfo.

It is also called a rule, to distinguish it from a compast or agreement; for a compact is a promife proceeding from us, law is a command directed to us. The language of a compact is, " I will, or will not, do this;" that of a law is, " Thou shalt, or shalt not, do it." It is true there is an obligation which a compact carries with it, equal in point of confcience to that of a law; but then the original of the obligation is different. In compacts, we ourselves determine and promise what shall be done, before we are obliged to do it; in laws, we are obliged to act without ourselves determining or promifing any thing at all. Upon these accounts law is defined to be " a rule."

Second pro-Municipal law is also " a rule of civil conduct." This diftinguishes municipal law from the natural or revealed; the former of which is the rule of moral conduct; and the latter not only the rule of moral conduct, but also of faith. These regard man as a creature; and point out his duty to God, to himfelf, and to his neighbour, considered in the light of an individual. But municipal or civil law regards him also as a citizen, and bound to other duties towards his neighbour, than those of mere nature and religion: duties, which he has engaged in by enjoying the benefits of the common union; and which amount to no more, than that

he do contribute, on his part, to the fubliftence and

peace of the fociety.

It is likewise " a rule prescribed." Because a bare refolution, confined in the breast of the legislator, without manifesting itself by some external sign, can never be properly a law. It is requifite that this refolution be notified to the people who are to obey it. But the manner in which this notification is to be made, is matter of very great indifference. It may be notified by universal tradition and long practice, which supposes a previous publication, and is the case of the common law of England and of Scotland. It may be notified viva voce, by officers appointed for that purpofe; as is done with regard to proclamations, and fuch acts of parliament as are appointed to be publicly read in churches and other affemblies. It may, laftly, be notified by writing, printing, or the like; which is the general course taken with all our acts of parliament. Yet, whatever way is made use of, it is incumbent on the promulgators to do it in the most public and perfpicuous manner; not like Caligula, who (according to Dio Caffius) wrote his laws in a very small character, and hung them up upon high pillars, the more

effectually to enfoare the people. There is fill a more Of Laws unreasonable method than this, which is called making in general of laws ex post facto; when after an action (indifferent in itself) is committed, the legislator then for the first time declares it to have been a crime, and inflicts a punishment upon the person who has committed it. Here it is impossible that the party could foresee, that an action, innocent when it was done, should be afterwards converted to guilt by a fubfequent law: he had therefore no cause to abstain from it; and all punishment for not abftaining must of consequence be cruel and unjust. All laws should be therefore made to commence in future, and be notified before their commencement; which is implied in the term " prescribed." But when this rule is in the ufual manner notified or prescribed, it is then the subject's business to be thoroughly acquainted therewith; for if ignorance, of what he might know, were admitted as a legitimate excuse, the laws would be of no effect, but might always be eluded with impunity.

But further: Municipal law is " a rule of civil con- Fourth preduct prescribed by the supreme power in a flate." For Perry. legislature, as was before observed, is the greatest act of fuperiority that can be exercised by one being over another. Wherefore it is requifite to the very effence of a law, that it be made by the fupreme power. Sovereignty and legislature are indeed convertible terms:

one cannot fubfift without the other.

This will naturally lead us into a fhort inquiry concerning the nature of fociety and civil government; and the natural inherent right that belongs to the fovereignty of a flate, wherever that fovereignty be lodged, of making and enforcing laws.

The only true and natural foundations of fociety are Civil for the wants and fears of individuals. Not that we can ciety. believe, with fome theoretical writers, that there ever was a time when there was no fuch thing as fociety; and that, from the impulse of reason, and through a fense of their wants and weaknesses, individuals met together in a large plain, entered into an original contract, and chose the tallest man prefent to be their onvernor. This notion, of an actually existing unconnected flate of nature, is too wild to be ferioufly admitted: and befides, it is plainly contradictory to the revealed accounts of the primitive origin of mankind, and their prefervation 2000 years afterwards; both which were effected by the means of fingle families. These formed the first society among themselves, which every day extended its limits; and when it grew too large to fubfift with convenience in that pastoral state wherein the patriarchs appear to have lived, it necessarily subdivided itself by various migrations into more. Afterwards, as agriculture increased, which employs and can maintain a much greater number of hands, migrations became lefs frequent; and various tribes, which had formerly separated, reunited again; fometimes by compultion and conquest, fometimes by accident, and fometimes perhaps by compact. But though fociety had not its formal beginning from any convention of individuals, actuated by their wants and their fears; yet it is the fenfe of their weakness and imperfection that keeps mankind together; that demonstrates the necessity of this union; and that therefore is the folid and natural foundation, as well as the cement, of fociety. And this is what we mean by the

perty.

T.

Of Laws original contract of fociety; which, though perhaps in general in no instance it has ever been formally expressed at the first institution of a state, yet in nature and reason must always be understood and implied in the very act of affociating together: namely, that the whole should protect all its parts, and that every part should pay obedience to the will of the whole; or, in other words, that the community should guard the rights of each individual member, and that (in return for this protection) each individual should submit to the laws of the community; without which fubmission of all, it was impossible that protection could be certainly ex-

Governmene
